b. Voltmeter. The meter movement discussed above can be used either as an ammeter or a voltmeter. How is this possible? You can measure voltage with the ammeter just described by placing resistance in series (not parallel) with the meter coil and measure the current flowing through the coil. In other words, a voltmeter is a current-measuring instrument designed to indicate voltage by measuring the current through a resistance of known value.

(1) A typical voltmeter circuit, shown in Figure 1-6a, is a simple-series circuit. As with the ammeter, it is possible to obtain various voltage ranges with a voltmeter. To obtain more than one range, various sized resistors, called "multipliers," are added in series with the coil, as shown in Figure 1-6b.

Figure 1-6. Typical voltmeter circuit

(2) The accuracy of any measurement made with a voltmeter depends, for the most part, upon the relationship between the total resistance in the meter circuit and the value of resistance across which the voltage is measured. This fact can be seen from a study of the circuit in Figure 1-7, showing both the actual voltage and the measured voltage as well as percentage of error. Observe that the voltage measured is two-thirds the actual voltage across R_M , an error of 33.3 percent, since the meter resistance is only one-half the value of the total resistance in the circuit.

Figure 1-7. Error in voltmeter readings

(3) If you double the meter resistance (increase to 4000 ohms), the error in the voltage reading diminishes to 30 percent (40 volts across R_1). If you increase the ratio between the meter resistance and load resistance even more by increasing the meter resistance you obtain a point where the voltmeter error can be tolerated.

(4) For practical purposes, the voltmeter error can be tolerated when the voltmeter resistance is ten times as great as the resistance across which the voltage is measured.

c. Ohmmeter. The ohmmeter is a device that uses a current-actuated meter and a fixed source of voltage for measurement of resistance (refer to Figure 1-8). It is used for practical work where simplicity, portability, and ease of operation are more important than a high degree of precision. There are two types of ohmmeters, the series type and the shunt type. The series type has the resistance to be measured connected in series with the meter movement. The shunt type has the resistance to be measured connected in parallel with the meter movement.

Figure 1-8. Typical ohmmeter circuit

(1) For any given ohmmeter, mid-scale deflection (one-half the maximum deflection distance) is obtained when the current through the meter is one-half the value of the current at full-scale (zero ohms) deflection. This condition exists when the resistance being measured is equal to the total meter circuit resistance. Analysis of the series-type ohmmeter circuit in Figure 1-9 shows that full-scale deflection is obtained when the meter test probe are shorted, and that less than full-scale deflection is obtained when the resistance to be measured is connected into the circuit.

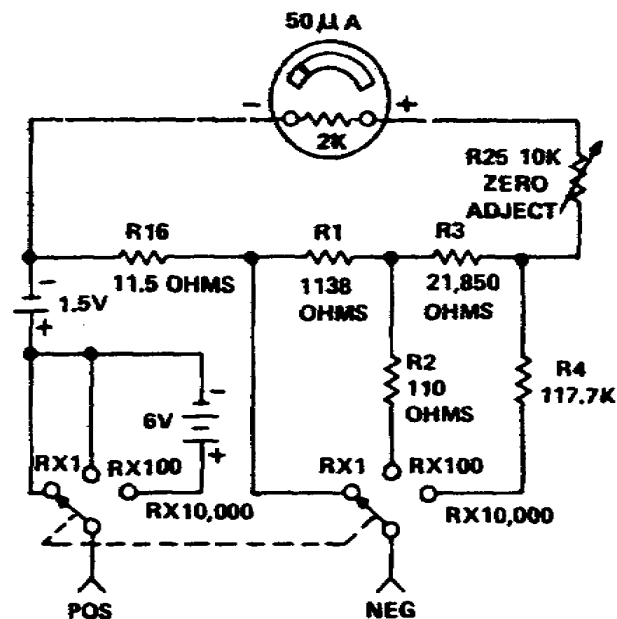

Figure 1-9. Circuit of a series ohmmeter

(2) Since the ohmmeter is calibrated at mid-scale, the mid-scale portion represents the most accurate portion of the scale. However, the usable range extends, with reasonable accuracy, on the high end to 10 times the mid-scale indication, and on the low end to 1/10th of the mid-scale indication.

(3) To extend the usable high range of the series-type ohmmeter, shunt R_s (fig 1-8), can be removed from the circuit, and the value of the series-dropping resistor R_c increased 10 times. This permits a mid-scale reading with a resistance of 10 times R_x . The limitations which prevent a further increase in the usable high range of the ohmmeter are fixed voltage (battery) and the sensitivity (current necessary for full-scale deflection) of the meter mechanism. You can obtain a higher range by increasing the battery voltage or by using a more sensitive meter mechanism. The former method is practical, and is used in some commercial test equipment.

(4) You can extend the usable low range of the ohmmeter by installing meter shunt R_s and decreasing R_c until the current in the circuit and the internal resistance of the battery limit any further extension of the range. Excessive current can extend the low range by decreasing the battery voltage, but this method is not feasible. Instead, a shunt-type ohmmeter is used.

d. The shunt-type ohmmeter (fig 1-10), measures low and medium values of resistance. The shunt-type ohmmeter scale is calibrated in the reverse direction from the series type because full-scale deflection is obtained with test probes open.

(1) Mid-scale deflection occurs when the combination of the meter resistance and the shunt R_s is equal to R_x , the resistance to be measured.

Figure 1-10. A shunt ohmmeter

(2) Limitations which prevent a further decrease in the range are:

(a) Internal resistance of the battery which becomes an appreciable part of the total circuit resistance, causing errors in readings to increase with battery age.

(b) Excessive current drain which decreases the life of the battery, and which could in some cases cause damage to the components under test.

(3) It is impractical to measure very low values of resistance with an ohmmeter. The ohmmeter, in itself, is only a means of approximating resistance values, where practical electronic work requires a convenient and speedy method of checking resistances.

Learning Event 2:

DETERMINE WHEN AND HOW TO USE METERS

1. When using a voltmeter or an ohmmeter you must use a range that is high enough to keep the deflection less than full scale. Before measuring a current or voltage, you should have some idea of its magnitude. Then switch to a large enough range or start with the highest range.

NOTE: Many voltmeters or ohmmeters have been ruined by attempting to measure amperes. Therefore, be sure to read the lettering either on the dial or on the switch positions, and choose the proper range before connecting the ammeter in the circuit.

2. When connecting the voltmeter (or ammeter) in the circuit, you must observe proper polarity. Current must flow through the coil in a definite direction in order to move the indicator needle up-scale. Wrong polarity (or reversal of current) results in a bent meter needle. You can avoid improper meter connections by remembering that the black meter leads are the negative leads and the red meter leads are the positive leads.

3. There are other precautions to observe with both the ammeter and the voltmeter. When using an ammeter, you must observe two important precautions.

a. Always connect an ammeter in series with the element through which the current is to be measured.

b. Never connect an ammeter across a source of voltage, such as a battery or a generator.

c. Remember that the resistance of an ammeter, particularly on the higher ranges, is extremely low and that any voltage, even a volt or less, may cause very high current through the meter, and severely damage the meter.

4. When using a voltmeter you must observe one additional precaution along with those already mentioned. Always connect a voltmeter in parallel across

the portion of the circuit in which voltage is being measured. If you observe these precautions when using an ammeter or voltmeter, you can obtain reliable results from these instruments.

5. If you wish to use a voltmeter and an ammeter in the circuit at the same time, there are two possible ways to connect them, but each produces an error.

a. If the meters are connected as shown in Figure 1-11a, the voltmeter reads the voltage across the resistor and the ammeter.

b. If the meters are connected as shown in Figure 1-11b, the ammeter reads the current through the resistor R_1 and the voltmeter.

c. Both methods further emphasize the fact that the resistance of the ammeter must be very low to keep the voltage across it small, and that the resistance of a voltmeter must be large enough to keep the current through it small.

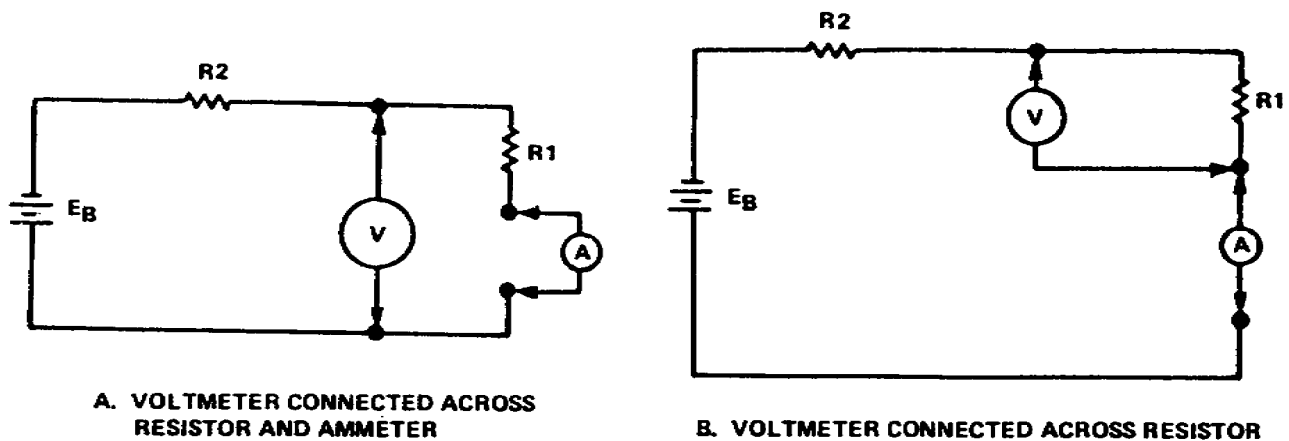

Figure 1-11. Measuring current and voltage simultaneously

6. In either of the above cases, the correct connection to use is the one leading to the least error and that depends on the relative values of resistance. If the resistance of the circuit is small (approaching the resistance of the ammeter), use the second circuit (fig -1-11b). If the resistance of the circuit is large compared to the voltmeter resistance, use the first circuit (fig 1-11a). For intermediate values of circuit resistance, either circuit connection is satisfactory.

7. You can determine the resistance of a circuit element by first measuring the current through it with an ammeter, then the voltage across it with a voltmeter, and finally apply Ohm's law. It is much more practical, however, to use an ohmmeter from which you can read resistance directly from a scale.

8. When using an ohmmeter to measure resistance, proceed as follows:

a. Choose a range which you think contains the resistance of the element that you are measuring or use a range in which the reading falls in the upper half of the scale.

b. Short the leads together and zero the meter, using the zero adjustments. If you change ranges at any time, remember to readjust to zero ohms.

c. Never attempt to measure resistance in a circuit while it is connected to a source of voltage.

d. Connect the unknown resistance between the test leads and read its resistance from the scale. When applicable, disconnect at least one end of the element being measured to avoid reading the resistance of parallel paths.

9. In addition to measuring resistance, the ohmmeter is very useful for checking continuity in a circuit. Often when troubleshooting electronic circuits or wiring a circuit, you cannot visually inspect all parts of the current path. Therefore, it is not always apparent whether a circuit is complete or whether current may be flowing in the wrong part of the circuit because of contact with adjacent circuits. The best method of checking a circuit under these conditions is to send a current through it.

a. If the conductor makes a complete circuit, current flows through the circuit. The ohmmeter is ideal for checking circuits. It provides the power to cause the current and it provides the meter to indicate the amount. To check, first study the circuit diagram, then check the corresponding parts of the circuit itself with the ohmmeter. The ohmmeter should indicate perfect conduction, partial conduction (resistance), or no conduction at all.

b. Ohmmeters are not always available, and even when they are, they are often of little value. The most common cause of a useless ohmmeter is a dead battery, which is usually caused by leaving an ohmmeter on the low-ohms scale. On this scale the meter draws current continuously. Another common carelessness is to leave a multimeter on the "ohmmeter" position and to permit the test leads to short circuit.

10. Since an ohmmeter may not be available, you must understand another way of determining resistance. There are two procedures you can use for measuring resistance without an ohmmeter.

a. One is the voltmeter-ammeter method. Connect the voltmeter and ammeter (fig 1-11(a)). After connecting the meters, use the voltmeter and ammeter reading to calculate resistance by Ohm's law.

voltmeter reading (volts)
R1=-----
ammeter reading (amperes)

b. If the resistance is high, the voltmeter method can be used. With the voltmeter method, a voltmeter with known resistance is connected in series with the unknown resistance (fig 1-12).

Figure 1-12. Determining value of unknown resistance of voltmeter

When power is applied, the voltage (E_m) across the meter can be read on the voltmeter. Then by shorting out resistor R_x (fig 1-11), the voltmeter indicates the applied voltage (E_b). Thus the voltage (E_x) across the unknown resistor is equal to the difference between the two measured voltages.

$$E_x = E_b - E_m$$

c. The voltages across the resistor and the meter are

$$E_x = IR_x \text{ and } E_m = IR_m$$

d. By dividing the first equation by the second equation, the currents cancel out:

$$\frac{E_x}{E_m} = \frac{R_x}{R_m} \text{ or } R_x = R_m \frac{E_x}{E_m}$$

e. But since E_x is equal to the difference between E_m and E_b ($E_b - E_m$) the unknown resistance is

$$R_x = R_m \frac{E_b - E_m}{E_m}$$

f. Since E_b , E_m , and R_m are unknown, the above equation can be solved for the value of the resistance R_x .

Learning Event 3:
DETERMINE METER SENSITIVITY

1. We have said that the voltmeter and ammeter have various ranges and also that you determine the resistance of the meter to decrease errors in readings. This points to the conclusion that meters are delicate devices which can respond to small forces.

2. The resistance of a meter movement and the maximum current permitted to flow through it are so small that the use of an unshunted meter movement as a measuring device is very limited. A typical meter movement has 50 ohms of resistance and gives full-scale deflection with 1 milliamperes of current through the meter coil. Such a meter movement has a 50 millivolt voltage across it at full-scale deflection as shown by the formula:

$$E = I \times R = 0.001 \times 50 = 50 \text{ millivolts}$$

The above meter movement is limited to measuring current values from 0 to 1 milliamperes and voltage from 0 to 50 millivolts.

3. How is it possible to have sensitive ammeters and voltmeters that can measure much larger values of current and voltage? Let's discuss sensitivity in more detail and see how it is possible to measure large values of current, voltage, and resistance with the applicable meters.

a. Ammeters. The sensitivity of a meter movement is inversely proportional to the amount of current that causes the indicator to deflect full scale. The smaller the current required for full-scale deflection, the more sensitive the meter movement. For measuring current in electronic equipment, ammeters with a sensitivity of 0.1 ampere or even 1 milliamperes are used. Meters with a sensitivity of 100 microamperes are common.

(1) To understand how to determine applicable shunt resistors for an ammeter, let's study the circuit in Figure 1-13. Since current through the two parallel branches divides in a ratio inversely proportional to the branch resistances, it is possible to calculate the current through the coil as well as the total current in the circuit in which current is being measured.

(2) In the circuit shown in Figure 1-12 you can find the current in the shunt (I_s) and the total current (I_t) in the circuit. For example, if the shunt resistance (R_s) is equal to 1/5th the value of the resistance of the coil (R_c), and current through the coil (I_c) is 0.5 milliamperes, there is 5 times as much current through the shunt (I_s) as through the coil (I_c), because the current divides in inverse proportion to the resistance; therefore, the current through the shunt is $2.5(5 \times 0.5)$ milliamperes. The total current in the circuit is 3 ($0.5 + 2.5$) milliamperes. The total current in the circuit is 3 ($0.5 + 2.5$) milliamperes.

Figure 1-13. Shunt resistor current range

Figure 1-14. Determining shunt resistors

(3) Calculations such as those involved in this example enable you to determine the size of the shunt required to extend the range of an ammeter. Although in actual practice you seldom make these calculations, you must know how meters having the same movement are constructed with different ranges, and how a range switch on the same meter changes the current range of the meter.

(4) Assume that you want to make an ammeter with the ranges of 0 to 10 milliamperes, 0 to 100 milliamperes, and 0 to 1.0 ampere, as shown in Figure 1-14. Also assume that the meter sensitivity is 1 milliampere and the coil resistance is 75 ohms.

(5) You can determine the values for R_{s1} , R_{s2} , and R_{s3} since the shunt and meter form a simple parallel circuit. As you know, the voltages across the shunt and meter are equal, as in the following formulas:

OR

OR

$$\begin{aligned} E_s &= E_m \\ I_s R_s &= I_m R_m \\ R_s &= \frac{I_m R_m}{I_s} \end{aligned}$$

(6) Where R_s is the shunt resistance, " I_s " is the current through the shunt at full-scale deflection, R_m is the coil resistance, and I_m is the current through the coil for full-scale deflection. Thus, the shunt resistance required to produce the ammeter shown in Figure 1-14 are 8.33 ohms, 0.758 ohm, and 0.0751 ohm respectively.

4. Voltmeter. In constructing a voltmeter with various ranges, you must determine the size of the multiplier to place in series with the meter coil.

a. For this discussion, we can use the same meter as used for the ammeter. The meter sensitivity is 1 milliampere and coil resistance is 75 ohms. Assume we need to determine the correct multipliers for ranges of 0 to 10 volts, 0 to 100 volts, and 0 to 500 volts (fig 1-15). Since 1 milliampere causes a full-scale deflection, the total resistance of the meter ($R_1 + 75$) must be such that the voltage across it is 10 volts (0-to 10-volt range) when 1 milliampere current is flowing. Thus:

$$R_1 = \frac{E}{I} \quad \text{or} \quad R_1 + 75 = \frac{10}{0.001}$$

Figure 1-15. Determining multipliers

b. The total resistance is 10,000 ohms and the resistance of the multiplier (R_1) is 9925 ohms. The resistance of the other two multipliers (R_2 and R_3) can be determined in a similar manner.

c. A term which you frequently encounter while troubleshooting television systems is voltmeter sensitivity. The sensitivity of a voltmeter is expressed in ohms per volt and is determined by dividing the resistance of the meter and the multiplier by the full-scale reading in volts. It is just another way of stating what current can cause full-scale deflection.

d. A voltmeter should have very high resistance so it draws very little current and affects the circuit as little as possible during voltage measurements. Sensitivity, therefore, is an indication of the measuring quality of a voltmeter. Generally, a meter with a 100-ohms-per-volt sensitivity is satisfactory. However, for good accuracy in circuits with high resistance, you must use a meter with a sensitivity of 20,000 (or more) ohms per volt.

e. To extend the range of a voltmeter, add a series resistor (multiplier). Normally this requires you to calculate the resistance of the multiplier. Then you merely add the required resistance in series so that the total resistance of the meter is satisfactory for the new range. You may wonder why you need to know how to increase the range of a voltmeter. In some cases you are required to measure extremely high voltages with a meter that does not have the required range. By determining the multiplier resistance and adding this resistance in series with the meter movement, you can measure these voltages.

f. As we have stated, the voltage indicated by the meter is somewhat in error, depending on the meter sensitivity. This error is due to the loading effect which the meter has on the circuit in which the voltage is being measured. To understand just how a meter affects (or loads) a circuit, observe the circuit shown in Figure 1-16. According to the values indicated, the total current in the circuit is 0.001 ampere.

$$I_t = \frac{120}{50,000 + 70,000} = 0.001 \text{ ampere}$$

Figure 1-16. Leading effect

g. The applied voltage divides across the two resistors--50 volts across $R1$ and 70 volts across $R2$.

h. When you connect a voltmeter across (from point A to point B) the resistor $R1$, you naturally expect the meter to read 50 volts. However, depending upon the sensitivity of the meter, it may indicate less than the 50 volts you expect. For example, suppose you are using a voltmeter with a sensitivity rating of 1000 ohms x 100, or 100,000 ohms. To find the resistance of a voltmeter, multiply the sensitivity rating by the full-scale voltage.

i. When you connect this voltmeter across the 5000-ohm resistor in the circuit, you put the meter in parallel with this resistor. The total resistance of the circuit effectively becomes 103,333 ohms. Thus the total current increases to approximately 1.16 milliamperes, the voltage across R2 increases to approximately 81.2 volts, and the voltage reading on the meter is approximately 38.8 volts.

j. You can avoid loading a circuit by using a voltmeter in which the resistance is large compared with that of the circuit element across which you are measuring voltage. If a voltmeter with such high sensitivity is not available, you can improve accuracy by using a higher range on the voltmeter. For example, if you used the 0-to 500-voltage range on the meter, the voltage across the resistor R1 would read approximately 47.2 volts.

5. Ohmmeter. Despite its usefulness as a resistance-measuring device, the ohmmeter is comparatively inaccurate. It is used only where resistance measurements need not be extremely accurate. A good rule to remember when you are using an ohmmeter, such as shown in Figure 1-17, is that the highest reading that can be obtained with acceptable accuracy is approximately ten times the mid-scale reading, and the lowest reading is approximately one-tenth of the mid-scale reading.

Figure 1-17. Typical ohmmeter scale

a. To determine the range of resistance within the above limits, you must determine what the total resistance of the meter circuit is to limit the current to 1 milliampere (full-scale deflection) when points T1 and T2 are connected together (short-circuited). Full-scale deflection is obtained when R1 is 5000 ohms.

$$R_1 = \frac{E_b}{I_t} = \frac{5.0}{0.001} = 5000 \text{ ohms}$$

b. Where E_b is the battery voltage and I_t is 1 milliampere (meter sensitivity), the above calculation reveals that the sum of the adjustable

and limiting resistor must be 5000 ohms if we are to obtain full-scale deflection. Full-scale deflection indicates zero resistance, and the meter scale is marked "0" ohms at 1 milliamperes point (fig 1-10). When a resistor (Rs) is placed between terminals T1 and T2, the total resistance of the circuit is increased, and a smaller current flows through the meter.

c. For mid-scale reading, the size of Rx (fig 1-17) between terminals T1 and T2 must be of a value to limit current to 0.5 milliamperes. Thus the total resistance of the circuit of half-scale deflection is 10,000 ohms.

$$R_t = \frac{E_t}{I_t} = \frac{5.0}{0.0005} = 10,000 \text{ ohms}$$

d. Therefore, Rx must be 5000 ohms for mid-scale reading when Rx is placed between T1 and T2. This leads to an interesting conclusion. The midscale resistance reading of an ohmmeter is equal to the internal resistance of the meter, and the scale may be so calibrated.

Learning Event 4:
DETERMINE VOLTS AND OHMS READING ON THE PSM-6

1. Multimeter PSM-6. As an aid to our discussion and for simplification, we will use the ME-70 PSM-6 multimeter illustrated in Figure 1-18.

2. The sensitivity of the PSM-6 voltmeter is the ohms-per-volt rating of the meter circuit, either 1000 ohms per volt or 20,000 ohms per volt. Ordinary voltmeters are not extra-sensitive, since the energy they use is only a very small percent of the energy produced by the current of the circuit being tested. For accurate readings of delicate network circuits where normal current is small, the current which energizes the meter becomes such a large percentage of the total current that erroneous readings and circuit malfunctions occur when you use a common voltmeter.

3. Reading the multimeter. Look at the dotted line shown on the meter face in the illustration in Figure 1-18. It shows an imaginary line where the pointer of the meter comes to rest. Suppose the function switch is turned to the direct-current voltage position, 20,000 ohms per volt (20K). This indicates that the middle scale (black) is to be read. Now suppose that the range switch is on the 50 volts position. This indicates that the maximum deflection of the meter needle represents 50 volts. Therefore, make your reading on the 5 scale, since there is no 50 scale, and 50 is a multiple of 5. The multiple selected is always 1/10th, 10, 100, etc. However, instead of the indicated numbers 1, 2, 3, 4, and 5, visualize this scale as reading 10, 20, 30, 40, and 50 volts respectively. Each numbered segment of the arc has a value of 10 volts. Therefore, each small division of the scale has a value of 1 volt. Thus the reading is one increment past the number 2 (visualized 20). It, therefore, represents a value of 21 volts direct current.

a. Suppose that we turn the range switch to 250 and, checking a circuit, we notice that the needle again comes to rest as shown. There is no maximum reading of 250 on the direct-current scale, but we can use the 2.5 scale. This time we visualize the indicated numbers 0.5, 1, 1.5, 2, and 2.5 as readings of 50, 100, 150, 200, and 250 volts respectively. Each number segment of the scale has a value of 50 volts; therefore, each small increment has a value of one-tenth of 50, or 5 volts.

b. Turn the function switch to the 1000 ohms per volt, alternating-current voltage position and make the reading on the AC scale, which is the lower one and is red. Take the reading with the range switch on the 500 position (fig. 1-18) making it on the 5 scale. The numbered positions of the scale are visualized as representing 100, 200, 300, 400, and 500 volts. Then with each increment of the scale representing 10 volts, you are reading 240 volts.

4. The dual external shunt shown in Figure 1-18 extends the direct current range of the instrument from its normal range (0.5 to 1000 milliamperes---1000 milliamperes equal 1 ampere) to provide either a 0-to 2.5-ampere range or a 0-to 10-ampere range. Three terminals provided at each end of the molded plastic are standard pin jacks which accommodate the test lead

Figure 1-18. ME-70 PSM-6 multimeter

probe. The two lead wires are shown attached to correctly measure the current of a circuit. Make all connections with voltage not applied. After checking all connections, turn the circuit on and read the meter.

5. MX-1410U, the high-voltage test probe (fig 1-18), extends the DC voltage range to 5000 volts. Notice that the function switch is in the 20K position, the range switch must be set at 500, and the high voltage test probe is connected to the positive test lead.

6. The MX-1441U test adapter (fig 1-18) is used to make crystal current measurements requiring a 1000-ohm load as seen from the plug end of the adapter.

7. The CX-2140U test Lead set (fig 1-18) includes a pair of four-foot test leads. These test leads have interlocking plugs installed at their set ends and test probe tips at the other end. Detachable alligator clips are also provided to fit over the test probe, to hold a component or clip on to a part of the circuit.

Learning Event 5:

DETERMINE THE VALUE OF R IN FUNCTION AND RANGE SETTINGS

1. The PSM-6 has a range switch allowing you to select DC voltage ranges of 0.5, 2.5, 10, 50, 250, 500, and 1000 volts. Further, since DC voltage may be checked at a sensitivity of either 1000 ohms/volts or 20,000 ohms/volts as selected by the function switch on the panel of the instrument operation (primarily the same regardless of whether the 20,000-ohms/volt or the 1000-ohms/volt function is selected), we will only discuss the 1000 ohms/volt operation. Figures 1-19 and 1-20 illustrate and identify both simplified circuits; if you know the operation of one, you can easily understand the other.

2. With the function switch set at the DCV Kohm/V position and the range switch at any position, the simplified circuit in Figure 1-19 shows the basic circuit configuration used to check DC voltages. Note in the diagram the range settings are obtained by the selection of resistors of various sizes. For example, when the range switch is in the 50 position, the value of R is such that 50 volts applied across the meter provides full-scale deflection. If the range switch is changed to position 10, then the value of R is such that 10 volts applied across the meter causes full-scale deflection, etc.

RANGE SETTING	VALUE OF R
.5	0
2.5	2,000
10	8,500
50	48,500
250	248,500
500	499,000
1,000	999,500

1,000 OHMS / VOLT

Figure 1-19. 1000-ohms/volt simplified circuit

RANGE SETTING	VALUE OF R
.5	0
2.5	40,000
10	180,000
50	890,000
250	4,980,000
500	8,980,000
1,000	19,980,000

20,000 OHMS / VOLT

Figure 1-20. 20,000-ohms/volt simplified circuit

3. The circuit illustrated in Figure 1-20 is, for all practical purposes, identical to that in Figure 1-19 except for the resistance values used. For instance, when the function switch is set at 20K ohm/V and the range switch at any position, the circuit reduces to the simplified diagram illustrated in Figure 1-20. Again, the value of R depends upon the position of the range switch, as shown in the accompanying table. The total resistance, including the 1700 ohmmeter resistance, provides a 20,000 ohms-per-volt sensitivity for all ranges selected.

4. While we are talking briefly about DC voltage measurements, note two simple things that can cause damage to the meter movement. Refer to Figure 1-21 and note what happens when the meter leads are connected backwards in the circuit. The meter needle deflects in the opposite direction and is damaged because it is driven into the stop, or, forced off scale.

Figure 1-21. Meter damage

5. Suppose the meter is connected to a source of voltage greater than that which produces full-scale deflection. In this case the current through the movable coil exceeds the 1mA for which the coil is designed and forces the meter needle off the scale and may burn out the meter coil.

Learning Event 6:
DETERMINE THE VALUE OF R FOR AC VOLTAGE MEASUREMENTS

1. The measurement of AC voltage is a procedure very similar to the DC voltage measurement procedure just discussed. Again, the controls on the front panel of the PSM-6 are the function and range switches. With the function switch set at ACV and the range switch at any position, the circuit is basically the one shown in Figure 1-22, with the values of R as shown in the accompanying table. The ACV ranges are also designed for a sensitivity of 1000 ohms/volts, and the total resistance between points A and B should therefore be 450 ohms. The two rectifier sections of CR101 rectify the incoming AC voltage, and the resulting pulsating DC is read on the meter. Resistor R132 is a variable resistance, set at the factory, to provide compensations for variations in rectifier characteristics and temperature correction.

RANGE SETTING	VALUE OF R
.5	0
2.5	2,000
10	9,500
50	49,500
250	249,500
500	499,500
1000	999,500

Figure 1-22. AC voltage measurement circuit

2. The same basic precautions applying to AC voltage measurements apply to DC measurements except that it is not necessary to observe polarities. One additional precaution that should be observed, however, is one not necessarily related to safety but one which results in proper use of the meter in AC voltage measurements. The AC voltmeter section of the PSM-6 is designed to handle frequencies up to about 1000 hz. Above this frequency the voltage readings are subject to inaccuracies due to inductive reactance.

Learning Event 7:
DETERMINE THE RANGE SELECTION USED IN RESISTANCE MEASUREMENT

1. Although it uses the same basic meter movement, as shown in Figure 1-21, the circuitry is quite different. The circuit contains a battery in series with the meter, as shown in Figure 1-23. The ohms zero control R118 allows you to zero the meter for considerable drops in battery voltage. With the meter leads shorted together, adjust the variable resistor to produce a full-scale reading on the meters.

RANGE SETTING	VALUE OF R1 (Ω)	VALUE OF R2 (Ω)	E (VOLTS)
X1	54	23.75	1.34
X10	17.5	234.8	1.34
X100	175	2,583	1.34
X1000	1,750	OPEN	1.34
X10,000	226,750	OPEN	13.4

Figure 1-23. Resistance measurement circuit

a. The full-scale reading indicates zero resistance. When you insert a 50-ohm resistor between the leads, the current in the circuit is reduced and the meter no longer reads full scale. In other words, the size of the resistor inserted between the leads determines the current through the meter and the amount of meter deflection.

b. The scale is calibrated to read directly in ohms. A range switch allows you to select ranges of x1, x10, x100, or x10,000. For example, a direct reading of 67 on the scale with the range switch at x100 means that the circuit has a resistance of 67×100 or 6700 ohms.

2. Look at Figure 1-24 and see what else we should recall about measuring resistance with the meter. This figure shows a portion of the synchronizing circuit located in a typical modulator. Notice that the ohmmeter is connected across R630. Should you expect to get a reading of 100 on the meter? No, you should not! If you analyze Figure 1-24 more closely, you will see that the current from the meter has two paths. One path is from point A to terminal 7 to T603, through the transformer winding to terminal 8, and return to point B.

Therefore, the current from the meter is flowing through two parallel paths, and the resistance measured by the meter is the less than total resistance of R630. To prevent this situation you must disconnect one end of R630 and then measure its resistance. In this way you can measure the true value of R630. Remember that when you measure a specific resistance, you should eliminate any parallel paths in order for the reading to be accurate.

Figure 1-24. Resistance measurement proper circuit conditions

3. Another point you should remember when measuring resistance with an ohmmeter is illustrated in Figure 1-25, which shows a portion of a typical voltage regulator circuit. Suppose that you want to measure the resistance of potentiometer R1. Of course the circuit power is turned off, and parallel paths have been eliminated by disconnecting leads X and Y. Now all you have to do is measure the resistance of R1. However, in this case the terminals of R1 are hard to reach; so you place your fingers on the metal tips of the meter leads in order to hold the leads on the potentiometer terminals. The meter has only about a 1.34-volt or 13.4-volt battery, so you will not get a shock. You have overlooked one little detail. You have placed yourself in parallel with R1. You will probably obtain a resistance reading of 150,000 to 200,000 ohms, which is the sum of a parallel circuit made up of you and R1. Although there is no safety factor involved in this example, you have obtained an erroneous meter reading which would probably lead you down the wrong trail when troubleshooting a circuit of this type. This in turn wastes time and can cause unnecessary replacement of components or parts.

Figure 1-25. Ohmmeter connection

Learning Event 8:
ANALYZE METER OPERATIONS

1. The remaining major capability of the meter is, of course, the current measurement function. When using the PSM-6, direct current up to 1 ampere may be measured. To do this, set the function switch to the DC MA position and set the range switch at one of its positions.

2. Refer again to Figure 1-22, the basic meter movement. As discussed earlier, the amount of current through the movable coil determines the amount of meter deflection. In the case of PSM-6, 50 microamperes of current through the coil is necessary to cause full-scale deflection. What would happen if we put 100 microamperes through the coil? This would damage or burn out the coil. The resistance allows only 50 microamperes through the coil if the range switch is set for higher than the total current in the circuit. For example, when the range switch is set at 50 and a current of 50 milliamperes are measured, 49.95 milliamperes flow through the resistor and 50 microamperes flow through the coil. This condition produces a full-scale deflection for that range setting and reads 50 milliamperes on the scale. In the actual circuit of the meter, different values of shunt resistors are used for each setting of the range switch.

3. Here, as with voltage measurements, be extremely careful to ensure that a range setting of sufficient amplitude is obtained so that the meter needle will not be pegged. If the needle does not deflect far enough to obtain an accurate reading, the range setting can always be decreased.

Learning Event 9:
MATCH OHMMETER READINGS TO CAPACITOR OR INDUCTOR CONDITIONS

1. Reactive components can become open or shorted. In either case the component is useless because it cannot store energy. Coils and capacitors can also become only partially efficient because of partial shorting or leaking.

2. Capacitor troubles. A leaky capacitor is equivalent to a partial short. The dielectric gradually loses its insulating properties under the stress of applied voltages. A good capacitor has very high resistance (in the megohms). A shorted capacitor shows zero resistance, while a leaky capacitor indicates less than normal resistance.

a. When the ohmmeter is initially connected, its battery charges the capacitor. Maximum current flows at the first instant of charge and the meter indicates low resistance. As the capacitor charge slows, less current flows, and the meter indicates more resistance. When the capacitor has charged to the meter potential, the charging current is zero, and the ohmmeter reads only a small leakage current through the dielectric. This capacitor action is normal.

b. Troubles in a capacitor are indicated as follows:

(1) When the ohmmeter reading is immediately zero and stays there, the capacitor is shorted.

(2) When the capacitor shows a charging action but the final ohmmeter reading is less than normal, the capacitor is leaking.

(3) The electrolytic capacitor must be checked by taking a normal reading, then reversing the ohmmeter leads and taking another reading. The higher reading indicates the true condition of the component.

(4) If the capacitor shows no charging action and immediately indicates a high resistance, it is open.

3. Inductor checks should be made with the component disconnected from the circuit if we are to set a true indication. The most common trouble in coils is an open, which is indicated by an infinite reading on the ohmmeter.

a. Less common troubles are a short between turns, a short between primary and secondary turns in a transformer, and a short to an iron core.

b. A coil has a DC resistance equal to the resistance of the wire used in the winding. For RF coils with inductance values up to several millihenrys, the 10 to 100 turns in the coil have a DC resistance of 1 to 20 ohms. Inductors for lower frequencies have several hundred turns and a range in resistance from 10 to 500 ohms, depending on the wire size.

4. When checking a transformer with four or more leads, check the resistance across the two primary leads, and across any other pairs of leads for additional secondary windings.

a. For an autotransformer with three leads, check the one lead to each of the other two. When an open is indicated in a coil, the connection from the external terminals to the coil should be checked. Often these can be re-soldered to make the coil reusable.

b. Shorted turns cannot be definitely checked with the ohmmeter because a few shorted turns will only slightly reduce the DC resistance. When shorted turns are suspected because of a reduced resistance, the unit should be replaced. Excess heat across the short can eventually create an open in the coil.

5. The resistance between separate windings in a transformer is normally infinite. If the ohmmeter is connected between the primary and secondary windings and reads a low resistance, this indicates a short between the primary and the secondary. Similarly, the resistance between the winding and the core or frame should be infinite. If a low reading is shown between these points, this indicates a short.

Learning Event 10:

IDENTIFY DIODES, CATHODES, AND ANODES, TO DETERMINE SERVICEABILITY

1. The solid-state diode may be thought of as a resistor that has a high resistance in one direction and a very low resistance in the other direction. As you remember, the end of a diode which current can easily enter is the cathode, while the end through which current leaves is the anode. A diode may become open or shorted. In either case, the diode is useless. We will discuss some of the common procedures for checking a diode.

2. There are several physical differences in diodes, but even if we know these differences, we may still be unable to discern between a diode and a resistor. One sure way to tell the difference is to check with an ohmmeter. A resistor has the same resistance to current in both directions. As shown in Figure 1-26, a diode exhibits a different resistance when reversing lead positions.

Figure 1-26. Forward-bias and reverse-bias diode

a. When the ohmmeter function on the PSM-6 is selected, the polarity of its leads reverses. The black lead becomes positive and the red lead becomes negative. In order to make the meter deflect in the proper direction, current must enter the meter through the black lead. To accomplish this on the ohms function, the internal battery is connected with its negative terminal to the red lead, and its positive terminal to the black lead.

b. The markings on a diode case often become illegible, and it is impossible to tell from visual inspection which lead is the cathode and which is the anode. In a situation such as this, it is possible to determine the cathode and anode of a diode by using an ohmmeter such as the PSM-6. To forward bias a diode, you must place a negative potential on the cathode. Therefore, when checking a diode for resistance ratio, if you know which lead is negative and which is positive, you can determine which lead is the cathode and which is the anode.

Learning Event 11

IDENTIFY SOME COMMON PROCEDURES FOR CHECKING TRANSISTORS

1. Transistors may be thought of essentially as two diodes mounted back to back. In this project you will use the PSM-6 to check the condition of transistors and determine their types. A transistor may become open or shorted. In either case, it is useless. The PSM-6 may be used to check the condition of the transistor. The following discussion will acquaint you with some of the common procedures for checking a transistor.

2. While using an ohmmeter to check the condition of a transistor, it is also possible to determine its type (PNP or NPN). Since a transistor is essentially two diodes mounted back to back, to check its condition you must measure the resistance ratio (about 10 to 1) of each junction emitter to base and collector to base, then measure the resistance between the emitter and the collector. Remember, when using the PSM-6 as an ohmmeter, the meter leads reverse polarity according to the way the internal power source is connected. The red lead becomes the negative lead, and the black lead becomes the positive lead.

a. Also, a transistor must be isolated from its related circuit before you can check its type or condition with an ohmmeter. In many cases this requires the transistor to be desoldered from the circuit and it is possible to obtain an erroneous ohmmeter indication. One example is shown in Figure 1-27.

Figure 1-27. False ohmmeter reading

b. With the meter connected across the emitter-collector circuit with an open condition, the meter measures 1K since the current flows out the negative lead through the 1K resistor to the positive meter lead. For this reason, whenever you check a transistor, two of the three leads must be disconnected from the circuit.

c. A transistor, like a diode, has a low-resistance junction when it is forward-biased and a high resistance when it is reverse-biased. When the meter leads are connected red to base and black to emitter, the lowest value of resistance is measured. This indicates a forward-biased condition.

d. When the E-B junction is forward-biased, a negative potential is applied to the base. You remember from your study of diode testing, this indicates that the base is constructed of N-type material and that the emitter is constructed of P-type material. Once you know the type of material that the base and the emitter, or collector, are made of, you can determine the type of transistor. Since we know the emitter is P-type material and the base is N-type, this must be a PNP-type transistor.

Lesson 1
PRACTICE EXERCISE

1. What are two of the three principal measuring instruments used to perform maintenance?
 - a. Voltmeter and frequency counter
 - b. Ammeter and ohmmeter
 - c. Voltmeter and oscilloscope
 - d. Oscilloscope and frequency counter
2. To measure large amounts of current you must put what in the circuit?
 - a. Impedance matching device
 - b. Shunt device
 - c. Temperature coefficient
 - d. Capacitance device
3. What must you observe when connecting a meter in circuit?
 - a. The current
 - b. Voltage
 - c. Impedance
 - d. Polarity
4. To determine full-scale deflection for a voltmeter, you use what formula?
 - a. $R_x = R_m \frac{E_b - E_m}{E_m}$
 - b. $E = 1 \times R = 0.001 \times 50$
 - c. $R_s = \frac{I_m R_m}{I_s}$
 - d. $I = R + E$
5. What must you do to extend the range of a voltmeter?
 - a. Add a shunt device
 - b. Add a parallel resistor
 - c. Add an impedance device
 - d. Add a series resistor
6. What are the two sensitivity settings of a PSM-6 voltmeter?
 - a. 500 ohms per volt and 20,000 ohms per volt
 - b. 1000 ohms per volt and 20,000 ohms per volt
 - c. 1000 ohms per volt and 10,000 ohm per volt
 - d. 500 ohms per volt and 10,000 ohms per volt

7. If your meter is set at 10 volts DC and you read across a 50-volt line, what happens to the meter?
 - a. Coil may burn out
 - b. Nothing will happen
 - c. Waveform is all right
 - d. Syn lock is all right
8. The maximum frequency the PSM-6 can handle to measure AC voltage is how many Hz?
 - a. 400 Hz
 - b. 800 Hz
 - c. 1000 Hz
 - d. 1400 Hz
9. What should you expect to read on your meter if your leads are as shown in Figure 1-24?
 - a. 100 ohms
 - b. Nothing
 - c. Parallel path
 - d. Correct waveform
10. To determine what type of transistor you are checking you do what first?
 - a. Check emitter to base
 - b. Check collector to base
 - c. Check emitter to collector
 - d. Remove from the circuit

LESSON 2
DEFINE THE THEORY AND APPLICATION OF AN OSCILLOSCOPE

TASK

Describe the theory and terminology related to maintenance procedures for the oscilloscope.

CONDITIONS

Given the information and illustrations about terms and theory relating to application of the oscilloscope.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering theory and terminology of using an oscilloscope.

REFERENCE

None

Learning Event 1:

DESCRIBE THE PRINCIPLES OF OPERATION OF AN OSCILLOSCOPE

1. The cathode-ray oscilloscope is a test instrument using a cathode-ray tube (CRT). It is one of the most important units of test equipment in maintenance and service. It is used to give a visual presentation of circuit waveforms which, by comparison, show the operation efficiency level of a portion of a circuit or a complete circuit contained in the system being tested.

2. When using the oscilloscope, you compare actual waveforms against optimum-efficiency waveforms which are permanently printed and located either at the equipment test points or on schematic diagrams in the applicable technical manuals. Scope patterns periodically taken at the test points are compared with those printed waveforms. Differences between the optimum waveform and the scope pattern indicate that the circuit (and the equipment) is below the optimum performance level and that corrective action should be applied.

3. The beam of electrons from a cathode-ray tube follows a straight line unless deflected by an electric or a magnetic field. Cathode-ray tubes are of two types according to the method used to deflect the electron beam. These types are electrostatic and electromagnetic. The electrostatic type of CRT is used in practically all cathode-ray oscilloscopes operating at test instruments. In the electrostatic type, the beam is deflected by an electric field

set up across the deflection plates by a deflection voltage. The progressive deflection of the beam paints the picture of the waveform on the face of the cathode-ray tube.

a. The inner face of the CRT is coated with a material which fluoresces when it is struck by the beam of electrical energy. In the CRT the beam is repeatedly swept across the screen. With the waveform, an alternating-current voltage can be observed on the screen when it is applied to one pair of deflection plates and when a second voltage of appropriate characteristics is simultaneously applied to the other pair of plates.

b. The conventional way of representing voltage or current of a sine waveform is shown in Figure 2-1. The voltage to be observed is applied between the vertical deflection plates; simultaneously, a sawtooth voltage is applied between the horizontal deflection plates. The sawtooth voltage moves the beam from left to right at a constant speed to form the time scale along line OX (fig 2-1). Then it returns the beam rapidly to the starting position at the left, and repeats the operation. The sawtooth voltage is so named because it resembles a sawtooth. As the voltage increases from A to B, the beam is swept from 0 to 12. As the voltage falls from B to C, the beam is quickly returned to its starting position (zero), and the process is repeated.

c. If an AC voltage of sine waveform is applied between the vertical deflection plates with no horizontal deflection, a single vertical line appears on the screen. The varying rate of change of the voltage is hidden because the vertical movements retrace themselves repeatedly on the same vertical line. Similarly, if a sweep voltage of sawtooth waveform is applied to the horizontal deflection plates in the absence of vertical deflection, a horizontal line is formed, and the rate of change of the voltage is obscured. However, when both voltage are introduced at the same time, the vertical motion of the beam is spread out across the screen to form a sine curve, such as the one shown in Figure 2-1.

A. SINE WAVEFORM PLOTTED AGAINST TIME

B. SAWTOOTH WAVEFORM PLOTTED AGAINST TIME

Figure 2-1. Sinewave and sawtooth voltage waveforms

4. A block diagram of a representative cathode-ray oscilloscope is shown in Figure 2-2. The horizontal deflection amplifier is a high-gain resistor-capacitor-coupled class A wideband voltage amplifier that increases the amplitude of the horizontal input voltages and applies it to the horizontal deflection plates. The sweep generator supplies a sawtooth voltage to the input of the horizontal amplifier through a switch that provides an optional external connection.

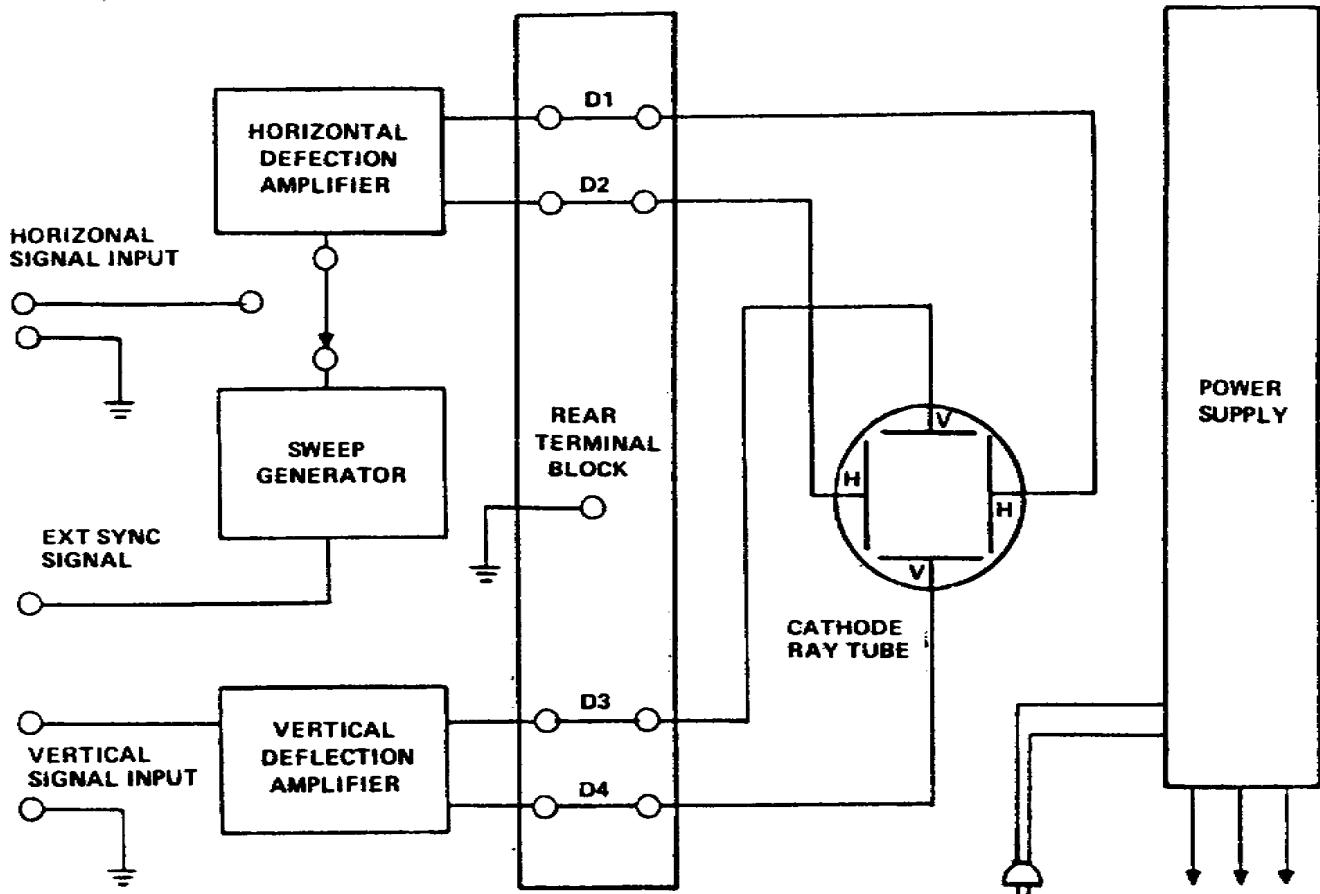

Figure 2-2. Block diagram of a typical cathode-ray oscilloscope

5. The vertical deflection amplifier increases the amplitude of the vertical input voltage before applying it to the vertical deflection plates. The input to the vertical amplifier appears in magnified form on the viewing screen as a graph of the current or voltage waveform being examined. A rear terminal block provides direct electrical connections to the deflection plates. These connections are used, for example, when one is examining direct-current potentials or high-frequency signals that would be attenuated excessively by the amplifier circuits. The power supply provides all DC voltages for the tubes, including a high DC voltage for the CRT.

a. You should consult the applicable technical manual for specific operating instruction covering your particular instrument. For proper use of any oscilloscope, you must consult the instruction regarding turn on and operation. Improper operation of the oscilloscope may cause damage to the instrument.

b. After the oscilloscope is properly set up, allow time for the instrument to warm up before you start to use it for checking waveforms. Make certain there is a good reference signal on the screen.

c. A couple of examples of a good signal, which you should be able to obtain at this point, are shown in Figure 2-3. If any other picture is obtained, adjust the appropriate scope controls until the proper picture is shown on the screen.

A. ALTERNATING CURRENT SIGNAL

B. DIRECT CURRENT SIGNAL

C. OTHER WAVESHAPES

Figure 2-3. Checking waveforms

Learning Event 2:
DESCRIBE THE VARIOUS CONTROLS ON AN OSCILLOSCOPE

1. If you understand the principle of operation of one oscilloscope you can apply the same techniques to other oscilloscopes, since all scopes operate on the same principle and have about the same controls. By discussing the controls in general you will have sufficient information to operate most types of oscilloscopes.

a. The two basic controls affecting the readability of the scope display are the beam intensity and focusing controls. These two controls are considered together because they interact to an extent that adjusting one requires adjusting the other.

b. The intensity control is used to adjust the spot to the brightness desired. When the spot is still, it becomes brighter, larger, and out of focus as the intensity control is rotated toward maximum intensity. Further rotation of this control produces secondary emission, causing a halo around the spot. When the halo appears, the intensity control must be immediately decreased to eliminate the halo before the screen is burned.

(1) The halo from an excessively bright spot disappears to some extent when the electron beam is subjected to the deflection fields because the energy in the electron beam is distributed over a much greater area.

(2) However, the spot will produce a wide trace, tending to obliterate any available fine detail.

c. The focus control is used to produce a round spot with a clearly defined edge. A stationary spot becomes smaller and sharper when you rotate the focus control from minimum toward maximum value. As you rotate this control beyond the focal point, an out-of-focus spot is again produced.

d. A poorly focused spot can appear elliptical instead of round. When the elliptical spot is set into motion under the influence of deflecting fields, it is noticeable as a line of variable thickness. The spot in motion produces a thin line only at the peaks of sine wave, while the positive and negative-going portions of the sine wave are considerably thickened.

e. Depending upon the velocity of the spot, an increase in spot intensity may be required because the rapidly moving spot does not remain in one position long enough to fully excite the phosphor screen of the cathode-ray tube. You may observe this effect in Figure 2-4, when viewing square waves with extremely rapid rise and decay times.

Figure 2-4. Beam intensity affected by spot velocity

f. The basic controls that determine the size of the display are potentiometers used as horizontal and vertical gain controls. Adjustment of the horizontal gain control increases or decreases the height of the display.

(1) An attenuator (occasionally referred to as a multiplier) is sometimes used prior to adjusting the gain control. It is associated with the vertical amplifier and is calibrated in steps of 1x, 3x, 10x, 30x, and 100x. The attenuation at each step is expressed with respect to the attenuation range at step 1x. Operation of this control results in abrupt changes in the scope display because of step attenuation of the input signal level.

(2) The attenuator is called a multiplier because the attenuator output is usually larger than the vertical amplifier input. The scope can be used as a direct-reading, peak-to-peak voltmeter once the vertical amplifier is calibrated. Calibrate the amplifier by setting the attenuator to 1x, inject a signal of known amplitude, and adjust the display to vertical dimensions of convenient known height. Advancing the gain control too far for a given signal, or applying a signal that exceeds the amplification capabilities of the horizontal or vertical amplifiers, results in overloading.

g. Interpretation of an observed waveform depends greatly upon proper proportioning of the horizontal and vertical dimensions of the scope display. Uncertainty or lack of knowledge concerning the signal that an amplifier is processing, together with improper display proportioning, can lead to an erroneous conclusion concerning the test circuit. Figure 2-5b shows the display of a trapezoidal waveform where the horizontal and vertical dimensions are acceptable.

A. VERTICAL GAIN HIGH, HORIZONTAL GAIN LOW

B. CORRECTLY PROPORTIONED

C. VERTICAL GAIN LOW, HORIZONTAL GAIN HIGH

Figure 2-5a, b, and c. Apparent changes in waveform with changes in vertical to horizontal proportioning

(1) By contrast, if both the horizontal and vertical gain controls are changed randomly so the change in the vertical direction predominates, the characteristics of the trapezoidal waveform become masked.

(2) If you were inexperienced in the use of a scope, or if you had no previous knowledge that the waveform was supposed to be a trapezoid, you could reach the erroneous conclusion that the display was a sawtooth waveform. On the other hand, if you know that the circuit produces a trapezoidal wave and wish to closely inspect the waveform for any irregularities, such proportioning of the display is entirely acceptable and advisable.

(3) By changing the horizontal and vertical gain controls once more to the opposite extreme so the display is exaggerated predominantly in the horizontal direction, you produce a waveform like that shown in Figure 2-5c. Under these conditions, the trapezoidal waveform viewed on the scope screen could be interpreted as a sawtooth waveform with excessive retrace time.

h. A height-to-width ratio of approximately 2 to 3 or 4 to 5 provides optimum display proportions for general purpose waveform examinations. Once you are certain of the waveform you are inspecting, expansion or exaggeration of the waveform in the vertical or horizontal direction to observe waveform irregularities may be very advantageous.

i. Sometimes the signal at the point under examination is so small that a display of more than a half-inch in the vertical dimension cannot be obtained. The horizontal dimension of the display must also be reduced so that the display is correctly proportioned. A reduction in beam intensity, followed by a refocusing of the spot, generally produces a display which is easier to view.

2. The vertical and horizontal positioning controls permit you to shift the position of the entire display to any portion of the viewing area desired. The vertical positioning control is a continuously variable potentiometer that permits the display to be moved up and down by any amount, including those positions away from the viewing area. Similarly, the horizontal positioning permits the side-to-side movement of the entire display.

3. Occasionally, while examining a waveform, you may notice irregularities at or near some extremity of the display. You can enlarge the display using other scope controls, and then position it by using the horizontal and vertical position controls, so the irregularity appears within the viewing area. The remainder of the signal, of which the irregularity is only a small part, is then deflected off the screen toward the neck of the cathode-ray tube, where it cannot be viewed. At the edges of the tube, the display being deflected off the screen widens and becomes considerably blurred at the rim of the tube. This distortion is caused by the curvature and the reinforcing thickness of the glass.

4. The coarse and fine sweep frequency controls of a scope provide for changing the frequency of the sawtooth sweep generator output (fig 2-2). The coarse frequency control is generally a multiposition rotary switch used to select the desired range of sawtooth frequency by changing the forward sweep time charging capacitor. The fine frequency control is a potentiometer used to adjust the sweep time constant (TC) to obtain the exact frequency needed for suitable display.

a. Selecting different shapes of the horizontal amplifier signals is also determined by the setting of the coarse frequency control. Five or six positions of the coarse frequency control are used to cover the full frequency range of the internal sawtooth sweep generator.

b. Sinewave signals are widely used for time base sweep applications. Such signals are easily obtained from the 60-Hz power source within the scope. The sawtooth sweep generator is disabled by the coarse frequency control when either the line sweep function or the direct function is selected.

5. With the fine frequency control and the coarse frequency control, you can select the time base required to display as many cycles or pulses as desired to view the waveform. Except for markings which aid in estimating some previous position, the fine frequency control is not calibrated because the time base frequency is only used as a means of obtaining a convenient display.

6. You can easily determine the frequency of the time base generator by injecting a known frequency into the vertical amplifier and manipulating the coarse and fine frequency controls for a stationary pattern of one cycle. If the injected signal is a 60-Hz sinewave, one sinewave lasting $1/60$ of a second is displayed by one sawtooth lasting for $1/60$ of a second. Therefore, the frequency of the time base generator is also 60 Hz and is a 1-to-1 frequency ratio, as shown in Figure 2-6.

Figure 2-6. Sweep frequency equals test signal frequency

7. If the pattern is not stationary, the method described is not valid and cannot be used with accuracy. It is easy to stop a scope waveform display by using these controls if the frequency of the waveform under investigation is within the frequency limits of the scope.

8. Now let's consider a couple of sawtooth sweep frequencies that are lower than the frequency of the waveform applied to the vertical input terminals.

a. Consider an input sinewave signal with a frequency of 60 Hz, and the resultant stationary display on the scope showing two complete cycles of the input waveform for one sweep of the time base generator. In this case the time base sweep is slow enough to display two cycles of the input wave, each one lasting $1/60$ th of a second. The sweep time is now a total of $2/60$ second (30 Hz) (fig 2-7).

Figure 2-7. Sweep frequency lower than test signal frequency

b. Consider a sinewave input signal of 1500 Hz. The resultant scope display is adjusted until a stationary pattern of three complete cycles is observed for one sweep of the time base generator. The sweep is now displaying three cycles, with each cycle lasting $1/1500$ second, and there are 500 sweeps per second.

c. When the display includes one or more complete cycles of an input waveform, whether completely stationary or not, the frequency of the time base generator is equal to or lower than that of the input waveform. In these cases where the display is adjusted for a stationary pattern, the frequency of the time base generator may be calculated by dividing the input frequency by the number of complete cycles displayed.

9. The synchronizing control provides for injecting a portion of the signal being amplified in the vertical section into the time base generator to produce a stationary waveform display. Throughout this discussion about time base sweep controls, we have emphasized the stationary display. To obtain a stationary display, the vertical amplifier input and the horizontal amplifier output have a whole-number frequency ratio and an in-phase relationship.

10. The synchronizing control potentiometer is used to inject as much of the synchronizing signal as needed to produce a stationary display pattern. The adjustment of this control is not critical, but an excessive synchronizing signal can severely distort the observed signal due to erratic functioning of the time base generator.

a. When there is no synchronizing waveform injected into the time base generator, the generator initiates a sweep when the potential on the plate is equal to the ionizing potential of the generator tube. The resulting sweep is free running under these conditions because the sweep rate is governed by the frequency-determining network of the generator. The display obtained may appear as a variety of constantly changing patterns, depending upon the frequency of the generator with respect to the waveform present in the vertical amplifier.

b. If the synchronizing control is advanced too far, the amplitude of the synchronizing signal produces a distorted sweep signal. The display obtained is undesirable because it is difficult to visualize the type of signal applied at the vertical input terminal. However, the pattern remains stationary, being continuously displayed as a single trace until corrective action is taken.

c. The synchronizing signal is often injected directly into the time base generator from a source external to the scope. Its use is dependent chiefly upon the type of signal undergoing observation and is especially useful for initiating triggered sweeps.

Learning Event 3:

DESCRIBE THE CHARACTERISTICS OF THE 453 OSCILLOSCOPE

1. One of the first things to observe concerning the 453 oscilloscope is its dual-channel capability. That is, you can apply two signals to the scope and can present the two signals at the same time or separately.
2. The vertical deflection system has a frequency response from DC to 50 MHz. Frequency response means the frequency over which the scope amplifies all frequencies uniformly. Another characteristic of the vertical deflection system is the deflection factor, expressed as the voltage required to produce a unit deflection on the CRT screen. The deflection accuracy of this scope is ± 0.3 percent of the indicated deflection. When channel 1 and channel 2 are cascaded by using an external cable, they can provide a 1-millivolt deflection factor, the volts/div switch on both channels must be set to 5 mV.
3. The 453 scope can also measure risetime accurately. By properly using the 20-mV to 10-V per division switches, you can measure risetime with accuracy to within 6.7 nanoseconds on each channel. Stable triggering is provided over the full range of vertical frequency response by the trigger circuits. Triggers are used to start the sweep generator.
4. The horizontal sweep system provides sweep rates from 0.1 microsecond per division to 5 seconds per division in 24 calibrated steps. Under normal operating conditions, the sweep accuracy is ± 3 percent of the indicated sweep rate. Using the sweep magnified characteristics, each sweep rate can be increased to 10 times the indicated sweep rate by expanding the center division of display. The calibrated delay time characteristic gives a sweep delay that is continuous from 50 seconds to 1 microsecond.
5. As we have already pointed out, this scope performs in a variety of environmental conditions. The instrument performs satisfactorily over a temperature range of -15°C to $+55^{\circ}\text{C}$ degrees. A fan in the rear of the scope blows air through the instrument. If the internal temperature exceeds a safe operating level, an automatic resetting thermal cutoff cuts off the instrument power. The power automatically comes back on when the temperature returns to a safe level. The warmup time for a given accuracy is 20 minutes. All of the characteristics of this instrument are listed in the applicable technical manual or technical order.
6. Front panel, left side controls for the 453 scope. The controls located to the left of the screen in Figure 2-8 control the signal display on the screen. Keep in mind the purpose of intensity, focus, scale illumination, trace finder, mode, trigger, volts/division, step attenuator balance, vertical position, and AC-GND-DC controls.
7. The intensity control (fig 2-8a) controls the brightness of the display. When setting the intensity control, do not set the control for more brightness than is necessary to provide a satisfactory display. Too much intensity can damage the CRT phosphor.

a. Front panel

b. Side panel

c. Rear panel

Figure 2-8. Type 453 oscilloscope

8. Adjust the focus control (fig 2-8a) to obtain a clear, well-defined image on the screen. The focus of the display may be affected by setting the intensity control. Therefore, it may be necessary to adjust the focus control a small amount when the intensity control is changed.

9. The scale illumination control (fig 2-8a) is directly under the focus control. Adjust the scale illumination control so that the graticule lines are illuminated to desired brightness.

10. The trace finder control (fig 2-8a) is used to locate a display which exceeds the scan of the display area. When you press the trace finder button, the horizontal and vertical deflection is reduced, and the display is compressed within the graticule area. After locating the display, center it by adjusting the position controls.

11. There are five modes of operation that can be selected by the mode switch. They are channel 1, channel 2, alternate, chopped, and algebraic addition (fig 2-8a). When either channel 1 or channel 2 is selected, only the signal that is applied to the respective channel is displayed. The other three modes are for dual-trace operations.

a. When the alternate position is selected, the signal applied to one channel is presented for one cycle of the horizontal sweep voltage. Then the signal applied to the other channel is presented for the next cycle of the sweep voltage. The scope CRT coating retains the image of the first channel's presentation during the time the second channel makes its presentation when the sweep rates are sufficient. Although all sweep rates can be used in the alternate mode, alternate mode switching becomes visually perceptible at slower sweep speeds. The chopped mode is preferred at sweep rates below about 0.5 millisecond per division.

b. In the chopped mode the signals applied to the two channels are electronically switched on and off to produce a display. The switching rate is about 500Hz. A segment of the signal displayed from channel 1 is displayed for about one microsecond; then a segment of the next signal from channel 2 is displayed for the next microsecond. For most applications the chopped mode provides the best display at sweep rates slower than about 0.5 millisecond or when dual-trace single-shot phenomena are to be displayed. At faster sweep rates the chopped switching becomes obvious and interferes with the display.

c. The third dual-trace operation is the algebraic addition mode. When the algebraic addition mode is selected, the signals from channel 1 and channel 2 are algebraically added, and the algebraic sum is displayed on the CRT. If you want to improve the signal-to-noise ratio, you can eliminate part of the noise by using this mode to display the difference of two signals. You can do this in the algebraic addition mode by following these steps.

(1) Apply the signal that contains the desired and undesired signals to channel 1 input and apply the signal containing only the undesired signal to channel 2.

(2) Invert the signal applied to channel 2 by pulling the invert switch located with vertical channel 2 controls.

(3) When the undesired components of both signals, opposite in polarity, are added algebraically, adjust the channel 2 volts-per-division switch and variable control to reduce the undesired signal.

12. The trigger control is a dial concentric with the mode switch (fig 2-8a). The trigger control selects the source of internal triggering signal from the vertical system. When the trigger control is set to normal, the sweep circuits are triggered from the displayed channel(s). Also, the channel 1 signal is available at channel 1 output connector, which is located on the side panel (fig 2-8b). If the trigger control is set to the channel 1 only position, the sweep circuits are triggered only from a signal on channel 1. No signal is available at the channel 1 output connector.

13. Since the vertical controls of channel 1 (fig 2-8a) are duplicated in channel 2, we will cover only the vertical controls of channel 1. Keep in mind that channel 2 controls perform the same function.

a. Locate the channel 1 volts-per-division switch on the left side of the front panel under the trace finder button. When you select a position on the volts/division control, you select a specific combination of frequency-compensated attenuator networks through which the applied signal must pass.

b. Notice that a smaller variable control is concentric with the volts/division control. To be specific, the variable control provides a continuously variable deflection factor to at least 2.5 times the setting of the volts/division switch. Always turn the variable control clockwise to the calibrated position when you adjust the vertical gain of that channel.

c. To check the vertical gain of the channel, the volts/division switch is set to 20 mV, and a 0.1-volt signal from the calibrator is connected to the channel's input jack. If the vertical deflection does not measure exactly 5 divisions, turn the gain adjustment to obtain exactly 5 divisions of deflection. The gain should be set with the volts/division switch set to 20 mV.

14. The step attenuator balance control (fig 2-8a). You should make the gain adjustment before making the step attenuator check.

a. To check the step attenuator balance, set the AC-GND-DC switch to GND, and set the A sweep mode switch to automatic trigger to produce a free-running sweep.

b. When a vertical shift in the trace occurs as you change the volts/division switch from 20 mV to 4 mV, an adjustment is required.

c. To make the step attenuator balance adjustment, position the trace to the graticule centerline when the volts/division switch is set to 20 mV. Then rotate the volts/division switch to 5 mV and adjust the step attenuator

balance to return the trace to the graticule centerline. When the step attenuator balance is properly adjusted, the trace does not shift when the volts/division switch is changed from 20mV to 5mV.

15. The vertical positioning control, which is located to the right of the volts/division switch (fig 2-8a), controls the vertical position of the trace.

16. The AC-GND-DC switch (fig 2-8a) is located below the volts/division control. It is used to select the method of coupling the input signal to the grid of the input amplifier. When DC position is selected, all components of the input signal are passed to the input amplifier. DC coupling can be used for most applications. However, with the DC component, it is better to select the AC position.

a. In the AC position the DC component of the input signal is blocked by a capacitor in the input circuit. The low frequency limit in the AC position is about 1.6 Hz. Although you can use the AC position for frequencies between 1.6 Hz and 16 Hz, use the DC position for signals below 16 Hz because they are attenuated by AC coupling. Also, you can expect some low frequency distortion at these low frequencies in the AC position.

b. When you select the GND position, a DC ground reference is established at the input circuit. The grid of the input tube is at ground potential. However, the input signal is not grounded. You may obtain a reference without removing the applied signal from the input connector (fig 2-8b).

Lesson 2
PRACTICE EXERCISE

1. What class of operation does the horizontal deflection amplifier operate under?
 - a. Class A
 - b. Class A & B
 - c. Class B
 - d. Class C
2. What can you use the oscilloscope for other than reading waveforms?
 - a. Waveform monitor
 - b. Peak to peak voltmeter
 - c. Vector scope
 - d. Ohmmeter
3. What must you adjust to obtain the exact frequency for a sweep time constant?
 - a. Course frequency adjust
 - b. Sawtooth sweep generator
 - c. Fine frequency adjust
 - d. Base frequency
4. For the 453 oscilloscope, how closely can the risetime of a signal be measured?
 - a. +/- 3 percent
 - b. 6.7 nanoseconds
 - c. One millivolt
 - d. 15.5 nanoseconds
5. How many modes of operation does the 453 oscilloscope have?
 - a. 3 modes
 - b. 4 modes
 - c. 5 modes
 - d. 7 modes

LESSON 3
DESCRIBE THE APPLICATION OF GRATING GENERATOR, DOT BAR
GENERATOR, AND VIDEO SWEEP MARKER GENERATOR

TASK

Describe the theory and terminology of maintenance with the application of video sweep marker generator, grating generator, and dot bar generator.

CONDITIONS: Given information and illustrations about terms and theory relating to the application of video sweep marker generator, grating generator, and dot bar generator.

STANDARDS

Demonstrate competency of the task, skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering theory and terminology of the application of video sweep marker generator, grating generator, and dot bar generator.

REFERENCES

None

Learning Event 1:

DESCRIBE THE USE AND PURPOSE OF A WAVEFORM MONITOR

1. The waveform monitor is a specialized oscilloscope which provides detailed or varied video information. It can present many video combinations from a complete television frame to a single segment of a desired line or even a single pulse shape or edge. Consequently, the waveform monitor is much more adaptable to television testing than the average scope. Its uses are much more suitable for system tests than for individual circuit or circuit component troubleshooting.

2. The major difference between the waveform monitor and the oscilloscope is the measuring scale. Examples of three of the scales for waveform monitors are shown in Figure 3-1.

ESTABLISHING MEASUREMENTS STANDARDS

No. 1

For use at camera control unit when sync is not inserted in this unit

Reference White - 100
Reference Black - 10
Blanking Level - 0
(Setup Value 10%)

No. 2

Monitoring scale for use on any waveform monitor where sync is present in the signal

Reference White - 100
Reference Black - 10
Blanking Level - 0
Sync Peaks - 40

No. 3

Used where desired to relate levels to depth of modulation of video carrier

Reference White - 12.5%
Reference Black - 67.5%
Blanking Level - 75%
Sync Peaks - 100%
Zero carrier (should never occur in practice) is set at 120 on scale

Figure 3-1. Video level measuring scales

a. These scales were designed to present a standard video level of 1 volt peak-to-peak. The scales are called Institute of Electrical and Electronics Engineers (IEEE) or Institute of Radio Engineers (IRE) scales. They are divided into 140 units which equal 1-volt peak-to-peak of composite video.

b. This 1-volt signal contains 0.714 volt video information (0 to 1000 units) and 0.286 volt sync (0 to -40 units).

3. The three scales in figure 3-1 illustrate the various points to be monitored in a system. Use operating scale No. 1 for points in the system where sync is not added. Operating Scale No. 2 is used in the system to measure composite signal (sync added). Operating Scale No. 3 is used at transmitter locations to relate IEEE units to depth of modulation.

Learning Event 2:
DESCRIBE THE USES OF A SIGNAL GENERATOR

1. A signal generator is a test device which generates an alternating voltage signal suitable for test purposes. It is, in effect, a small radio transmitter generating a signal of any desired frequency. The signal may be either modulated or unmodulated and is used for the following checks or tests:

a. Alignment of tuned circuits, sensitivity measurements, and approximate frequency measurements.

b. For frequency measurements, its use is limited because it is not a frequency meter and cannot be used as a frequency standard.

2. The signal generator is used primarily in the alignment of tuned circuits. A signal generator is classified according to its frequency and is one of two types: audio frequency or radio frequency.

a. Audio frequency generators produce signals with a frequency range from 20 Hz to 20kHz.

b. Radio-frequency generators produce signals covering a range of frequencies from 10 kHz to 10 GHz. Many radio-frequency generators have audio outputs separately available through front panel jacks. These outputs are normally 100 and 400 Hz.

3. When using the generator, the output test signal is coupled into the circuit being tested, and its progress through the equipment is traced by the use of high-impedance indicating devices such as vacuum-tube voltmeters or scopes. In many signal generators, calibrated networks of resistors, called attenuators, are provided. These are used to regulate the voltage of the output signal and also provide correct impedance values for matching the input impedance of the circuit under testing. Accurately calibrated attenuators are used, because the signal strength must be regulated to avoid overloading the circuit receiving the signal.

4. There are many types of signal generators. They may be classified roughly by frequency into audio signal generators, video signal generators, radio frequency generators, frequency-modulated RF generators, and special types which combine all of these frequency ranges.

5. Audio signal generators.

a. Audio signal generators produce stable audio-frequency signals used for testing audio equipment. Video signal generators produce signals which include the audio range and extend considerably further into the RF range. These generators are used in testing video amplifiers and other wideband circuits.

b. In both audio and video generators, the major components include a power supply, an oscillator, one or more amplifiers, and an output control. Voltage regulation circuits are necessary to ensure stability of the oscilla-

tor in the generators which derive power from 115-volt AC sources. In portable generators, battery power supplies are usually used, and these require no voltage regulation.

c. In the audio and video generators of the beat-frequency type, the output frequency is produced by mixing the signals of two radio frequency oscillators, one of which is fixed in frequency and the other variable. The difference in frequency of the two is equal to the desired audio or video frequency.

(1) Audio signal generators often include RC oscillators in which the audio frequency is directly produced. In these a resistance-capacitance circuit is the frequency-determining part of the oscillator. The frequency varies when either the resistance or the capacitance is changed in value.

(2) In commercial generators, however, the capacitance alone is often chosen as the variable element. The change in frequency which can be produced by this method is limited, and it is usually necessary to cover the entire range of the generator in steps. This is accomplished by providing several RC circuits, each corresponding to a portion of the entire range of frequency values. The circuits in the oscillator are switched one at a time to give the desired portion of the audio range.

d. The amplifier section of the block diagram (fig 3-2) usually consists of a voltage amplifier and one or two power amplifiers. These are coupled by means of RC networks, and the output of the final power amplifier is often coupled to the attenuator, or output control, by means of an output transformer.

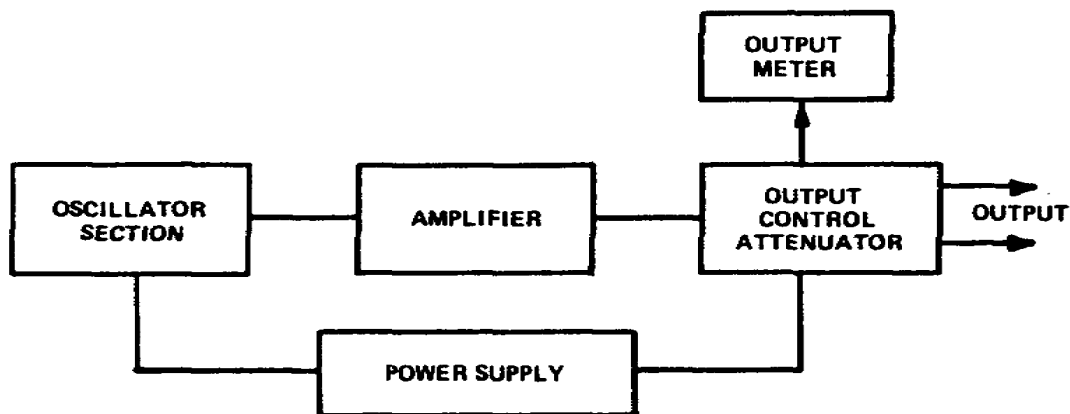

Figure 3-2. Block diagram of audio or video signal generator

e. The output control section provides a means of matching the output signal to the input of the equipment under test and regulating the amplitude of the signal.

6. Radio frequency (RF) signal generators.

a. A typical radio frequency signal generator contains, in addition to the necessary power supply, three main sections; an oscillator circuit, a modulator, and an output control circuit. The internal modulator modulates the radio frequency signal of the oscillator. In addition, most RF generators are provided with connections through which an external source of modulation of any desired waveform may be applied to the generated signal. Metal shielding surrounds the unit to prevent the entrance of signals from the oscillator into the circuit under test by means other than through the output circuit of the generator.

b. A block diagram of a representative RF signal generator is shown in Figure 3-3. The function of the oscillator stage is to produce a signal which can be accurately set in frequency at any point in the range of the generator. The type of oscillator circuit used depends on the range of the frequencies for which the generator is designed. In low frequency signal generators, the resonating circuit consists of a group of coils combined with a variable capacitor. One of the coils has a selector switch attached to the capacitor to provide an LC circuit that has the correct range of resonant frequencies.

Figure 3-3. Block diagram of RF signal generator

c. The function of the modulating circuit is the production of audio (or video) voltage which can be superimposed on the RF signal produced by the oscillator. The modulating signal may be provided by an audio oscillator within the generator, or it may be derived from an external source. In some signal generators, either of these methods of modulation may be used. In addition, a means of disabling the modulator section is used whereby the pure unmodulated signal from the oscillator can be used when it is desired.

d. The type of modulation used depends on the application of the particular signal generator. The modulating voltage may be either a sine wave, a square wave, or pulse of varying duration. In some specialized generators, provision is made for pulse modulation in which the RF signal can be pulsed over a wide range of repetition rates and at various pulse widths.

e. Usually the output of the generator contains a calibrated attenuator and often an output level meter. The output level meter gives an indication of, and permits control of, the output voltage of the generator by indicating arbitrary values of output readings in tenths through the value of one. The attenuator selects the amount of this output. The attenuator, a group of resistors forming a voltage-dropping circuit, is controlled by a knob which is calibrated in microvolts. When the control element is adjusted so the output meter reads unity (1.0), the reading on the attenuator knob gives the exact value of the output in microvolts. If output voltage is desired at a lower value, the control is varied until the meter indicates some decimal value less than one, and this decimal is multiplied by the attenuator reading to give the output in microvolts.

7. Frequency-modulated RF signal generators. Frequency-modulated RF signal generators are widely used for testing frequency-modulated receivers and for visual alignment of AM receivers. A frequency-modulated signal is an alternating voltage in which the frequency varies above and below a given center frequency value. The overall frequency change is called the frequency swing.

Learning Event 3:

DETERMINE THE DIFFERENT MODES OF AN ELECTRONIC COUNTER

1. An electronic counter is used for the comparison of an unknown frequency or time interval with a known frequency or time interval. The counter's logic is designed to present this information in an easy-to-read numerical display. The accuracy of this measurement depends on the stability of the known frequency. This known frequency is obtained from the internal oscillator of the counter.

2. The logic control interconnects the proper circuit, selects the proper measurement units for display, and starts the measurement cycle.

a. An electronic counter can be operated in the totalizing mode with the main gate flip-flop controlled by the manual start-stop switch illustrated in Figure 3-4. With the switch at start, the decimal counter assemblies totalize the input pulses until the main gate is closed by changing the switch to stop. The display on the counter shows the pulses received during the interval between manual start and manual stop.

Figure 3-4. Electronic counter totalizing method, block diagram

Figure 3-5. Electronic counter frequency measurement, block diagram

b. Frequency measurements. The input signal is first applied to a signal shaper that changes the input signal to uniform pulses. The output of the shaper is then applied to the decade counting assemblies, often passing through a gate which is controlled by the time base of the counter, as shown in Figure 3-5.

c. The number of pulses for the desired period of time, totalized in the decade-counting assemblies, represents the frequency of the input signal. The counted frequency is shown on a numerical readout with a positioned decimal point. This reading is held until a new sample is taken. The sample rate control decides the display time of the frequency measurement being performed. The sample rate control also starts counter reset and the next measurement cycle. The time base selector switch determines the gating interval, positions the decimal point, and selects the proper measurement units.

d. The electronic counter makes periodic measurements with its function arranged (fig 3-6). An unknown input signal controls the gate time. The time base frequency is counted in the decade-counting assemblies. The input shaping circuit uses the positive-going zero axis crossing of successive cycles as triggers for opening and closing the gate.

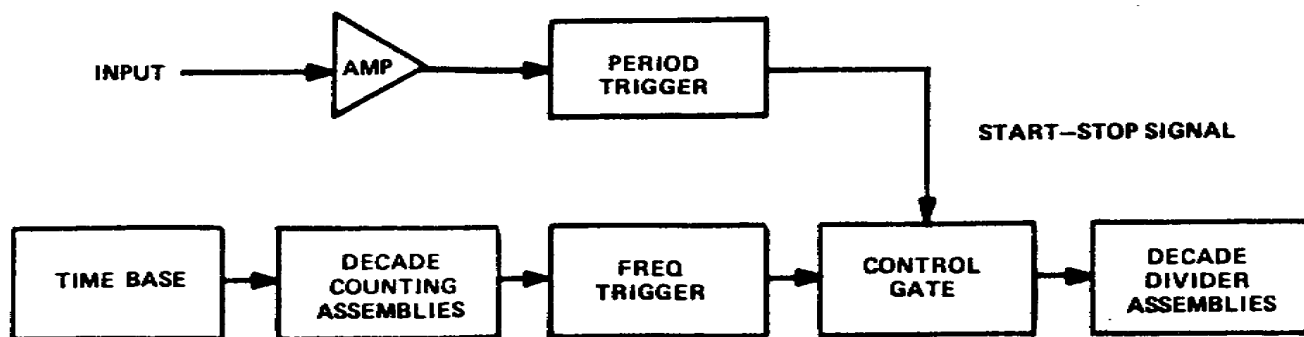

Figure 3-6. Electronic counter period measurement, block diagram

(1) A periodic measurement gives a more accurate measurement of an unknown low frequency signal because of increased resolution. A frequency measurement of 100 hertz on a counter with a 10-second gate time will be displayed as 0000.1000 kilohertz (kHz).

(2) When using the same counter, a single period measurement of 100 Hz with 10 megahertz (MHz) as the counter frequency would be displayed as 0010000.0 microseconds on the counter. The resolution is increased by a factor of 100.

e. The ratio of two frequencies is obtained by using the lower frequency signal for gate control and having the higher frequency signal counted (fig 3-7). If you use the proper transducers, ratio measurements may be applied to any phenomena, providing the phenomena can be represented by sine waves or pulses. Measurements that can be made with the ratio method are clutch slippage, gear ratios, and frequency divider operations.

Figure 3-7. Electronic counter ratio measurement, block diagram

f. If you use a preset counter, or a counter with a preset plug-in unit, you may make frequency measurements by proper selections of the gate time. A plug-in unit may be set to a gate time of 600 milliseconds. This setting causes an input from a 100-pulse-per revolution tachometer to be displayed directly in revolutions per minute.

g. Time interval measurements are similar to period measurements. The only exception is that the trigger points on the single waveform or waveforms are adjustable, and when the com-sep switch is placed in COM position, measurements may be made from one point on a waveform to another point on the same waveform (fig 3-8). Triggering polarity, slope, and amplitude are selected for each channel separately. The time interval is displayed in microseconds, milliseconds, or seconds.

Figure 3-8. Electronic counter time interval measurement, block diagram

(1) A time interval counter that can measure extremely short time intervals is available.

(2) A 1-MHz external frequency standard is multiplied to 100 MHz in order to obtain 10-nanosecond time increments as the counted frequency, resulting in good resolution.

3. Precise high-frequency measurements are possible because of several innovations in quartz oscillator crystal design. These have resulted in superior electronic counter time bases. Ambient temperature affects the frequency by being outside ranges of -20 degrees to +50 degrees C. The accuracy of the counter is limited by the time base oscillator stability because this oscillator circuit furnishes the definitive time information for a measurement. The time base must be calibrated periodically, because the drift rate causes a cumulative deviation in frequency which can result in measurement error. The accuracy of precision quartz oscillators is usually expressed as long-term stability. Short-term stability refers to changes in average frequency over a time sufficiently short so that the change in frequency due to long-term effects is negligible.

4. There are four methods of extending the digital frequency measuring capability of electronic counters. These methods are the prescaling method, the heterodyne method, the harmonic generator, and the transfer oscillator method. Each of the four methods is explained, and the basic principles of operation are shown in block diagram.

a. In the prescaling method, (fig 3-9) the input signal is amplified and scaled by a decade in order to divide the input frequency by a factor of 10. The input to the counter from the prescaler is now within the direct measuring range of the counter. For example, if the prescaler is used in conjunction with a 10-MHz electronic counter, then the direct measuring range of the counter is extended to 100 MHz.

Figure 3-9. Electronic counter prescaling method, block diagram

b. The heterodyne method is a high frequency measuring method based on subtracting known reference frequencies until the different frequency is within the direct measuring range of the electronic counter.

Figure 3-10. Electronic counter heterodyne method, block diagram

c. A harmonic generator produces all harmonics of 10 MHz. A harmonic selector cavity is manually tuned until the selected harmonic, mixed with the input, produces a different frequency that is fed through an amplifier to the counter. A level meter indicates when the harmonic selector reaches the proper reference frequency. To find the frequency being measured, add the reference frequencies to the electronic counter display. This addition usually involves nothing more than placing one or two digits before the counter reading.

d. The transfer oscillator method (fig 3-11) provides an extremely wide measuring range with counter accuracy. In this method, a transfer oscillator is used in conjunction with a 50-MHz electronic counter. The transfer oscillator method compares harmonics of a fundamental frequency with an unknown high frequency.

(1) When you are measuring, adjust the fundamental frequency to the point where one odd harmonic has the same frequency as the input signal. This is accomplished by beating harmonics against the input signal in a mixer and varying the fundamental frequency until the difference frequency is zero. The results are observed on a built-in scope.

(2) The counter can read out the unknown frequency which equals the fundamental frequency multiplied by the harmonic number. The proper harmonic number, selected by the front panel harmonic preset switches, automatically expands the counting period of the counter. This expansion results in a direct presentation of the input frequency in the readout of the counter.

(3) The transfer scope includes a phase lock that is designed to synchronize itself with the input signal. Changing the transfer oscillator frequency to maintain a precise 1-MHz beat frequency compensates for any frequency change in either the input signal or the transfer scope.

5. The automatic method (fig 3-12) makes it possible to obtain instantaneous direct readings of unknown microwave inputs.

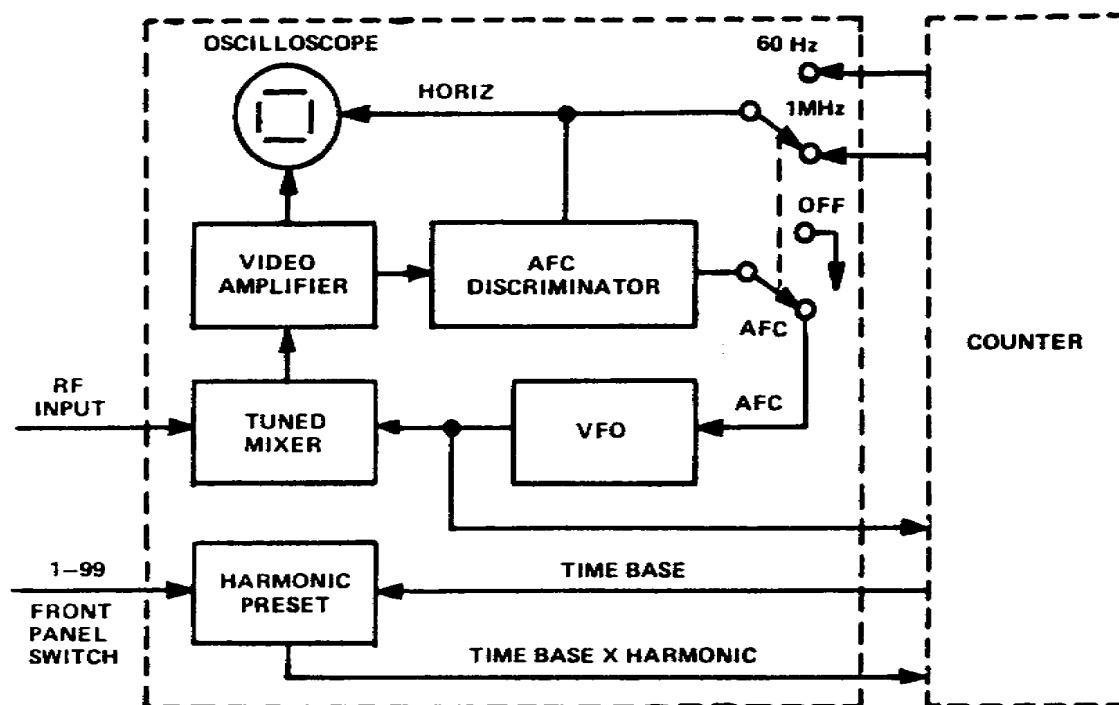

Figure 3-11. Electronic counter transfer oscillator method, block diagram

Figure 3-12. Electronic counter automatic method, block diagram

a. An unknown signal (F) is fed into a harmonic mixer. A swept oscillator frequency (f) is applied to a mixer, and harmonics are generated and mixed with the input signal. A 1-MHz signal from the counter time base is used as a phase detector and locking frequency for the output signal of the mixer. This circuit phase-locks the proper harmonic (N) of the swept oscillator signal (f) with the input signal (F) at a precise 1-MHz offset.

b. The input signal (F) is also applied to a second mixer which has the same swept oscillator signal (f) but with the addition of a 1-kHz signal from the counter. When the phase detector locks the swept oscillator, the signal in this second mixer will be N (f=1kHz) which is mixed with the input frequency (f).

c. When the offset is exactly 1 MHz, then $F = fN \pm 1 \text{ MHz}$. The output of the second mixer is 1 MHz plus N kHz. The 1-MHz signal from the counter is mixed with the output of the second mixer and the resultant signal is N kHz. The mixed signal (N kHz) is then applied to a digital N computer circuit along with the 1-kHz signal from the counter.

d. This circuit then divides the N kHz by 1 kHz and the result is N pulses. The N pulses are gated in conjunction with the counter time base signal. This extension multiplies $f \times N \pm 1 \text{ MHz}$ so the counter can read out the unknown input frequency directly with the 1-MHz offset.

Learning Event 4:
DESCRIBE THE USES OF A SOLID STATE DEVICE TESTER

1. There are several methods for testing solid state devices. In this section we will discuss the testing of diodes and transistors using a typical oscilloscope and locally manufactured diode and transistor testers. You must fully understand the operation of the scope. If you have any doubt about the operation of the scope, review the section on scopes.

2. Most diodes and transistors can be tested for shorts and opens with a multimeter, when no solid-state tester is available. The use of a multimeter is discouraged because the meter's internal power supply can cause damage to the component under testing or other components in the circuit under testing.

3. Using a diode tester and an oscilloscope, you can easily test and compare diodes. Diode testers are commercially available. In most cases your shop will not be authorized to have any type of diode tester. You can build your own which will be extremely accurate and efficient. Figure 3-13 shows the schematic diagram of a simple diode tester, and Figure 3-14 shows the pictorial diagram. A variable transformer provides the 0- to 110-volt input. For testing most diodes a 6-VAC input is sufficient, but you must exceed the breakdown voltage when testing a zener diode. With a variable 0- to 110-volt transformer, you can adjust the input to test most zener diodes. The 6.3-VAC center tap (C/T) input to this tester (fig 3-14) is for reference only. This input must be variable to exceed the breakdown voltage of a zener diode under test.

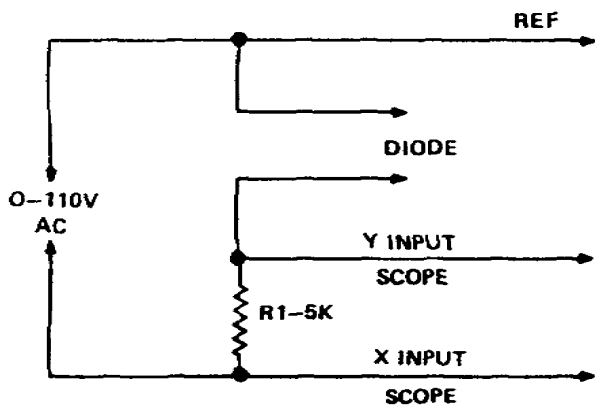

Figure 3-13. Diode tester schematic diagram

Figure 3-14. Locally manufactured diode tester

4. To test a diode, follow this procedure:

a. Connect the horizontal or sweep probe of the scope to the X terminal of the tester (fig 3-14) and adjust the display to a 2-centimeter horizontal line (common scope lead to reference).

b. Remove the X lead and connect the vertical probe of the scope to the Y terminal of the tester (fig 3-14) and adjust the vertical display on the scope to 4 centimeters by adjusting the variable AC input to the tester.

c. Reconnect the X lead as mentioned above. You should get a diagonal display on the scope as illustrated in Figure 3-15a.

d. Connect the diode between the diode terminals on the tester and compare the trace on the oscilloscope with those shown in Figure 3-15.

e. Determine the condition of the diode. By testing known good diodes you can make your own trace patterns for comparison with other diodes.

Figure 3-15. Oscilloscope traces of diodes

5. Transistors, unlike vacuum tubes, are very rugged because they can tolerate vibration and shock. Under normal operating conditions a transistor provides a long period of dependable operation. Transistors may fail when subjected to minor overloads. You can use various test methods to determine the condition of a transistor. In many cases you can substitute a transistor of known good quality for a questionable one. This method is highly accurate and sometimes expeditious. You should avoid indiscriminate substitution. When transistors are soldered into equipment, substitution is impractical because the transistor may be damaged during desoldering or soldering. In this case, it is generally desirable to test the transistor in the circuit if a tester with this capability is available.

6. Since certain fundamental characteristics are indicative of the condition of a transistor, test equipment is made to test these characteristics with the transistor either in or out of the circuit. Although triode testers are commercially available, as are diode testers, you may have to make your own. Figure 3-16 shows the schematic diagram of a typical transistor tester and Figure 3-17 shows a locally made transistor tester.

Figure 3-16. Transistor tester schematic

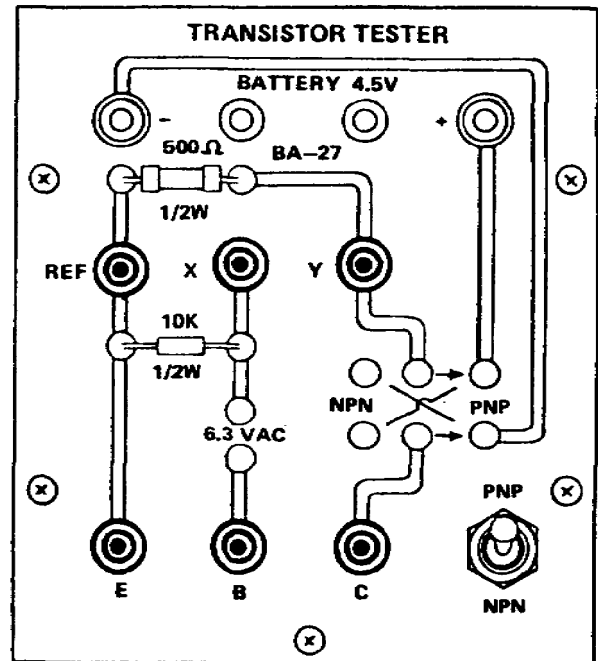

Figure 3-17. Locally manufactured transistor tester

7. By using a transistor tester and a scope you can test transistors in the same manner as you test diodes. To test a transistor connect the transistor tester to the scope, and adjust the scope as follows:

a. Connect the vertical input probe of the scope to the Y input terminal of the tester, the horizontal input probe of the scope to the X input terminal of the tester, and the common probe of the scope to the reference terminal on the tester.

b. Short E to B on the tester, and adjust the horizontal gain control on the scope until you get a 4-cm horizontal display on the scope.

c. Short E to C on the tester, and adjust the signal voltage until you get a 2-cm vertical display.

d. Connect a transistor to the tester (emitter to E, base to B, and collector to C).

8. Determine the condition of the transistor under testing by comparing your trace with the traces illustrated in Figures 3-18, 3-19, and 3-20. As in testing diodes, you can test known good transistors and make your own trace patterns to compare with other transistors.

Figure 3-18. Oscilloscope traces of PNP transistors

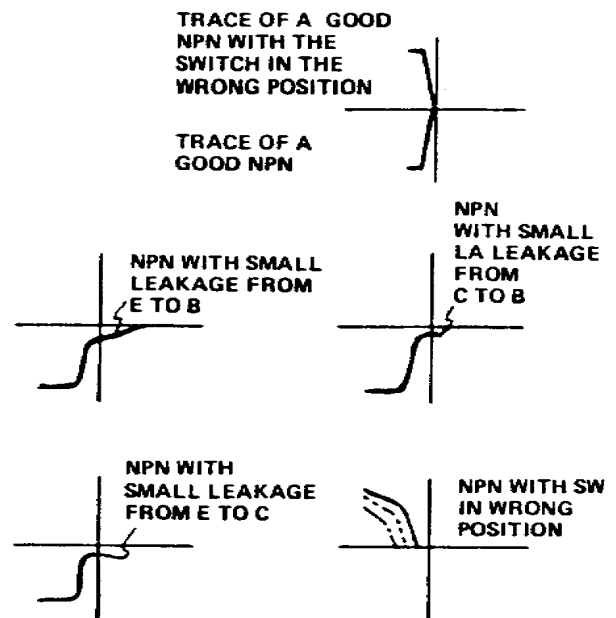

Figure 3-19. Oscilloscope traces of NPN transistors

Figure 3-20. Oscilloscope traces of distortion and gain in transistors.

Learning Event 5:
IDENTIFY VIDEO TESTING EQUIPMENT AND ITS OPERATION

1. This section will discuss the grating generator, dot bar generator and video sweep marker generator. We will go through their purpose and operation, as well as interpret their output patterns.

2. The grating generator provides a convenient means of checking and adjusting the linearity of television deflection circuits. It generates a timing signal synchronized by standard synchronizing generator or the deflection circuits of the receiver under test, and injects this signal into the video circuit being tested. The pattern produced has the appearance of a grating as shown in Figure 3-21.

Figure 3-21. Grating test pattern

a. The block diagram, Figure 3-22, shows the typical grating generator circuitry necessary to produce a satisfactory grating pattern.

(1) The desired pattern is produced by inserting the horizontal and vertical pulses from either a standard television synchronizing generator or the deflection circuits of a television receiver, as previously stated.

(2) The vertical pulses are then multiplied 15 times, while the horizontal pulses are multiplied 20 times. They are vectorially added in the adder circuit and the output is applied to a clipper.

(3) The output pattern of the grating generator is determined by the bias point of the clipper circuit. When the bias is adjusted so that either the horizontal or vertical signal extends above the clipping level, the resulting output is a grating pattern.

(4) Moreover, the grating signal must be clipped at both ends of the amplitude range so that the lines will not appear blacker than black at their intersecting points.

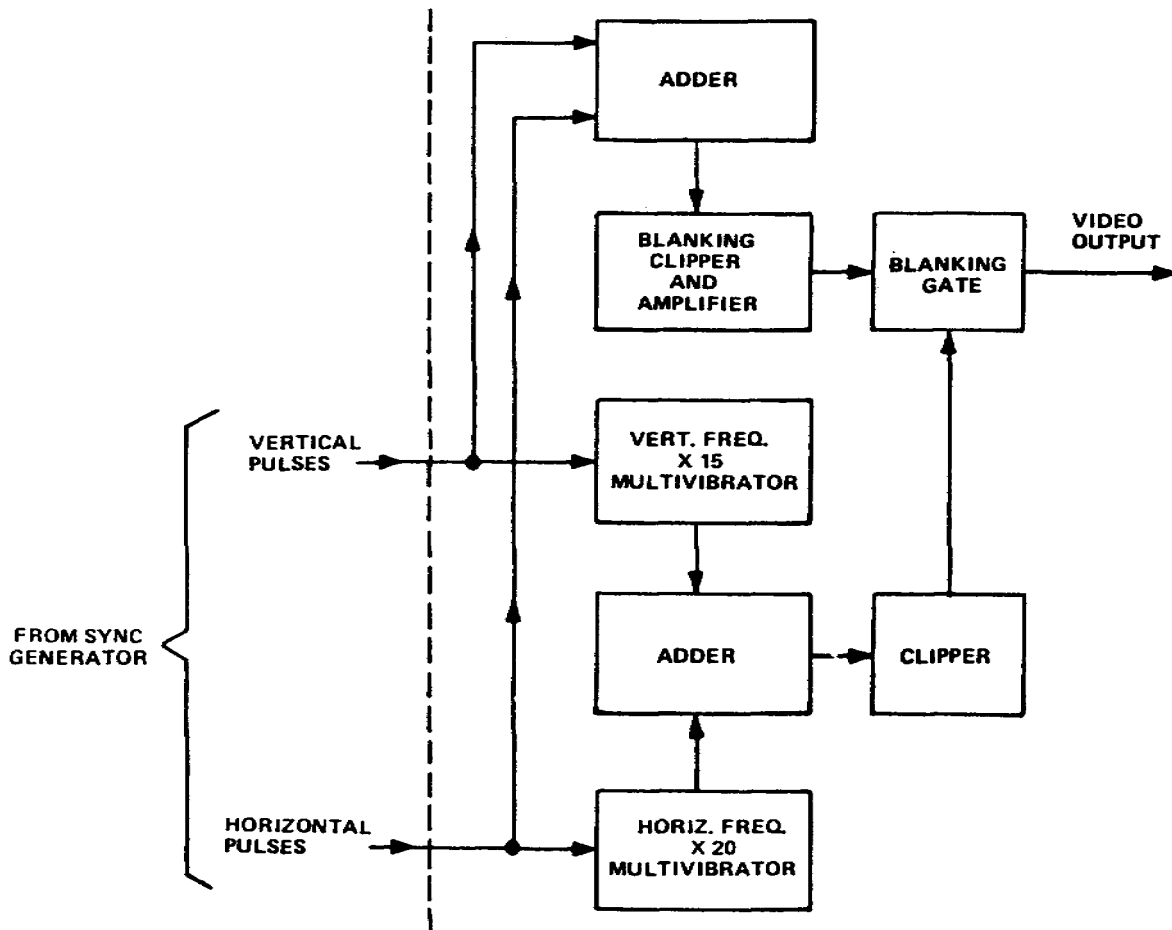

Figure 3-22. Grating generator, block diagram

b. To prevent lines from appearing during retrace, the horizontal and vertical retrace pulses are combined, as shown in Figure 3-22. When added, they form a blanking pulse, and this pulse is applied to the blanking gate circuit. An output signal is produced only when the incoming signal is strong enough to override the level of the blanking pulse.

c. The grating pattern is comprised of 14 horizontal bars and 17 vertical bars. The bars, being evenly spaced, conform with both the aspect ratio of the television system and linearity chart, discussed later on.

d. The grating generator also produces either horizontal or vertical bars separately. By selecting the output from either the times -15 or times -20 multivibrator and applying it to the signal clipper, the generator output results in horizontal or vertical bars only.

e. By injecting the grating pattern into a receiver or monitor and checking the display uniformity, you can determine discrepancies in the deflection circuit's linearity. The linearity is adjusted properly if the vertical and horizontal bars are both uniformly spaced over the entire viewing area. The grating pattern is also useful when you adjust the linearity of a camera chain.

f. Another valuable feature of the grating pattern is apparent when you adjust the convergence of a color receiver or monitor.

3. The same generator is often used to generate the dot pattern or the grating pattern. Only the clipper bias point will determine which output is produced. If the signal clipper bias is so adjusted for an output only when horizontal and vertical pulses are added, a dot pattern results (fig 3-23). The other circuits in the dot bar generator and their operation are identical to those in the grating generator.

4. The video sweep marker generator is a convenient device for checking the frequency response of a given amplifier.

a. In a typical generator, the output of a fixed RF oscillator, operating at approximately 70 MHz, is heterodyned against a sweep frequency oscillator. The sweep oscillator is being swept at a 60-Hz rate. The 0- to 10-MHz beat frequency is then applied to the circuit or unit being tested, and the resulting output, after detection, is observed on a scope.

b. Marker notches are inserted at 1-MHz intervals for frequency calibration of the beat frequency; this is accomplished by an additional oscillator stage in the sweep generator.

c. A more accurate means of calibrating can be obtained with a sweep generator unit that uses a calibrated CW oscillator as a marker source. This type of marker source provides either variable or fixed markers over a marker source range of 100 kHz or 10 MHz.

Figure 3-23. Dot test pattern

d. The most useful function of the sweep marker generator is to test and adjust the bandpass of camera preamplifiers. The equipment layout used to check a camera preamplifier with a sweep marker generator is shown in Figure 3-24. Figure 3-25 shows the output pattern of a properly tuned camera preamplifier as seen on the scope. Notice the notches inserted in the output. These markers help you observe the range of frequency response of the output pattern from the camera preamplifier. These marks are important because the frequency response curve must be flat to 8 MHz for adequate bandpass of the television video information.

Figure 3-24. Camera amplifier bandpass check

Figure 3-25. Oscilloscope presentation of camera bandpass

5. The pulse cross display is one of the most important measurements in television and it is used to determine whether the synchronizing generator is producing the proper pulse sequence, width, and amplitude.

a. The pulse cross display, along with its correct interpretation, is a convenient means of conducting operational measurements of the output pulse produced in the synchronizing generator. The pulse cross display is practical for routine operational measurements because this test requires only the use of modified video monitor. This monitor is usually available in any television station.

b. Other types of more detailed pulse analysis and adjustments may be necessary at periodic intervals. These functions require the use of specialized test equipment.

c. In normal video transmission, the horizontal and vertical synchronizing pulses occur at the end of each scanning line and each field respectively. The front porch of the horizontal synchronizing pulse occurs at the right edge of the picture, and the back porch occurs at the left edge. The vertical blanking interval occurs during vertical retrace. This information contained in the vertical blanking pulse occurs at the top and bottom of the viewing screen. Since all of the synchronizing and blanking information occurs at the edges of the picture area, its information is hidden by the picture tube mask.

d. Though detailed information may be difficult to distinguish, the general shape of the vertical blanking interval can be observed on most standard receivers and monitors by rotating the vertical-hold control until the vertical blanking bar is located in the viewing area. The horizontal synchronizing and blanking pulses at the end of each scan line are much more difficult to observe. With the modifications normally provided, the standard television monitor eliminates any definition, vertical displacement, or horizontal displacement problems. The pulse cross display can be observed instantly or monitored continually for extended periods of time.

e. The individual lines can be seen more readily if the horizontal and vertical scanning process is expanded. As a result, the pulse cross display information is seen in more detail. Expansion of the picture tube sweep circuits permits the horizontal and vertical synchronizing and blanking information to be placed in the viewing area of the picture tube.

f. Interpretation of the pulse cross display is relatively easy when you understand that the individual pulse amplitudes are indicated by light intensity. In the pulse cross display shown in Figure 3-26 the horizontal dimensions of the light intensities are relative measures of time or pulse widths. Use Figure 3-26 to identify the following pulse group patterns:

- (1) The horizontal synchronizing pulse duration (0.075H-0.98H).
- (2) The horizontal blanking pulse duration (0.165H-0.18H).
- (3) The vertical synchronizing pulse interval (0.42H-0.44H).
- (4) The vertical blanking interval (13.1H-21.0H).
- (5) E and F- the equalizing pulse intervals.
- (6) G- the six dark lines which show vertical synchronizing pulse duration.
- (7) I- the equalizing pulse duration (0.5 horiz sync width).

(8) H- the horizontal blanking and synchronizing pulses that continue to occur at the end of each horizontal video scan line until the beginning of the next vertical blanking interval.

- (9) K- the front porch of the horizontal blanking pulse ($0.02H$).
- (10) L- the back porch of the horizontal blanking pulse ($0.05H$).
- (11) M- the pulses which occur during the remaining vertical blanking time.

Figure 3-26. Pulse cross display

g. Each pulse width may be compared to its normal duration. After you have had some experience in using the cross display, you may devise a ruler calibrated in normal pulse widths to check the pulse cross display. Of course this ruler would apply only to a particular monitor. You can also use the pulse cross display to check the number of lines in the equalizing and vertical pulses.

6. Good resolution of a picture is indicated by sharply defined objects and no blurring or running together of closely spaced lines or points. Horizontal detail and vertical detail must be considered separately in a television picture. The maximum vertical resolution is determined by the number of active scanning lines. The horizontal resolution is determined by the maximum number of changes in voltage that can occur in each line that is scanned.

7. Standard test charts have been developed to permit more comprehensive testing of system performance.

a. The resolution chart (fig 3-27) can be used for making system quality tests for geometric distortion (linearity), aspect ratio, resolution, shading uniformity, frequency response, streaking, interlace, gray scale reproduction (contrast), brightness, and RF or other high frequency interference.

Figure 3-27. Resolution chart

b. When making a geometric distortion check, position your camera, and focus on the test chart. A picture free from distortion has linear scanning and correct aspect ratio. Check your linearity by comparing the spacing between the short horizontal bars at the top, bottom, and center of the picture.

(1) If the spacing is equal in each set of horizontal bars, vertical linearity is satisfactory. The circles located in each corner and at the center of the chart are a further check for geometric distortion.

(2) Circles that are nonlinear or distorted in shape indicate incorrect adjustment of the vertical, the horizontal, or both horizontal and vertical sweep linearity.

(3) You can check the aspect ratio by measuring the large portion of the picture formed by the four grayscale bars. If the pattern is square and the scanning is linear your aspect ratio is correct.

c. To check interlace, you observe the diagonal lines in the center square of the picture. Interlace is correct if the lines appear similar to those in Figure 3-27. Jagged diagonal lines indicate partial pairing of the lines. The diagonal lines do not appear jagged if complete line pairing occurs. Under this condition, total line pairing can be determined by the resolution wedges, since vertical resolution cannot exceed 250 lines.

d. Radio frequency or other high frequency interference is sometimes introduced into the video amplifier scanning circuits. Radio frequency interference in the horizontal sweep circuits from the power supply is indicated when the vertical lines in the test pattern become modulated and take on a ripple appearance. Radio frequency or other high frequency interference in the video amplifier is indicated by a moire pattern over the whole picture.

e. The standard linearity chart (fig 3-28) is used when camera linearity adjustments are to be made. This chart has an aspect ratio equal to that of the grating pattern. The circles occur at the same positions in the linearity chart that the lines intersect in the grating pattern. The two test patterns are superimposed on a monitor screen when you focus the video camera on the linearity chart and simultaneously transmit it and the pattern from a grating generator. A camera with linear scanning produces a picture uniformly distributed on the screen. You can adjust the linearity of the camera by adjusting the camera linearity controls so that the circles of the linearity chart coincide with the intersections on the grating pattern within an acceptable percent of tolerance.

Learning Event 6:

DESCRIBE THE PURPOSE AND TYPES OF COLOR TEST EQUIPMENT

1. Since color television requires more critical standards of operation, several types of test equipment are necessary to maintain these standards. In this section, we shall discuss the purpose and usefulness of some of the test equipment used to maintain these critical standards and the function of such equipment as the linearity checker, color-bar generator, vectorscope, and grating generator. We will also interpret the output patterns produced by this equipment.

2. The gain and phase in a color video signal must be maintained at an established level. A composite color signal consists of a luminance component on which is imposed the 3.58-MHz color subcarrier. The subcarrier is modulated so that the amplitude determines the degree of saturation of the reproduced colors, and phase relationships produce hue.

3. The typical linearity checker provides a means for measuring differential gain and phase, dynamic gain, luminance signal linearity, and luminance distortion caused by chrominance signal nonlinearity in systems under test. The linearity test signals are useful for measuring nonlinear distortions such as differential gain, differential phase, and line-time nonlinearity (fig 3-28).

a. Differential gain is, basically, the change in the chrominance signal amplitude as the amplitude of the luminance signal changes between black and white.

b. Differential phase is the change in phase of the chrominance signal amplitude changes between black and white.

c. Differential phase and gain measurements can be made using a vectorscope.

d. Line-time nonlinearity signal is the difference in gain from the black level to the white level of a video signal. Monochrome signals and the luminance portion of color signals are affected by this distortion.

e. The 5-step linearity signal is commonly used to measure the amount of line-time nonlinearity. The output of the circuit being measured is differentiated and fed to a scope or waveform monitor. An external differentiating network may be used.

f. During the active portion of each field the flat field signal has a luminance level which is variable from 0 to 100 IRE units in 10 IRE increments. It is used to test clamper amplifiers and systems in general for APL (average picture level) dependent distortions.

4. There are two basic models of the color bar generator. The first is a compact, lightweight generator instrument used primarily where portability is desired. The second mounts in a standard 19-inch rack, and is used primarily in the television broadcast system. In both units the operation is about the same, and the desired outputs serve the same basic purpose.

a. With its variety of test signals, the color bar generator is an excellent tool for use in analyzing television system defects or anomalies. The following paragraphs list the color bar generator test signals and their general applications.

(1) The standard full field color bar signal consists of eight equal intervals arranged in descending order of luminance as follows: gray, yellow, cyan, green, magenta, red, blue, and black (fig 3-29). This signal is used for checking luminance, hue, and saturation parameters of the television system.

(2) Split field Y reference signal provides standard color bars in the first part of the test pattern display and luminance-only shades of gray to black in the second part (fig 3-30). The split field Y reference signal is especially useful for checking color balance and tracking of color picture monitors.

Figure 3-29. Full field color bars

Figure 3-30. Split field Y Reference

(3) Split field red signal includes the standard color bars in the first part, while the second part contains the red color-bar signal only (fig 3-31). Video system noise, VTR head banding, and red phase are readily seen by using the solid red split field signal. Split field reverse signal provides standard color bars in the first part and color bars in the reverse order during the second part (fig 3-32). Dynamic range and color tracking of video monitors can be checked with this test signal pattern.

Figure 3-31. Split field red

Figure 3-32. Split field reverse

(4) EIA standard color bar signals comply with RETMA ENGINEERING COMMITTEE TR-4 on television transmitters, "EIA Standard for Encoded Color Bar Signals." It is used for adjustment of color monitors and encoders and for making rapid checks of color television transmission systems.

(5) The standard EIA signal consists of two major parts. Three-fourths of the active scanning lines in each field are divided into seven equal intervals arranged in descending order of luminance as follows: gray, yellow, cyan, green, magenta, red, and blue (fig 3-33a). The remaining one-fourth of active scanning lines is used for the transmission of special test information consisting of a subcarrier signal envelope with a phase corresponding to a reference white pulse, a subcarrier signal envelope with a phase corresponding to -1, and a reference black interval (fig 3-33b).

Figure 3-33a, b, and c. Picture monitor, waveform monitor, and vectorscope displays of the standard EIA test pattern signal

(6) Figure 3-33b shows the color bar signal as seen on a waveform monitor triggered at horizontal rate. Vector relationships of the various burst and chrominance components are shown in Figure 3-33a.

(7) The standard color bar signal may be used for making phase and gain adjustments in color monitors, or for verifying overall accuracy of the decoding function. An experienced operator can learn to judge the accuracy of monitor adjustments by direct observation of color bar pattern on the display device. For more objective measurements, the waveforms resulting from the decoding of the standard color bar signal can be used.

(8) The accuracy of matrix and phase adjustments in encoders may be readily checked by comparison of the standard color bar signal with the output of such a device, when the standard signal is applied to the encoder inputs. The signal embodies several convenient references and relationships that facilitate its use. The relative amplitudes of all signal components can be checked by direct observation of the complete waveform on a television waveform monitor. A waveform monitor display should exhibit the following relationships (fig 3-33b).

(a) The positive peak levels of yellow and cyan bars are nominally equal to reference white level.

(b) The negative peak level of the green bar is nominally equal to reference black level.

(c) The negative peak levels of the red and blue bars are nominally equal.

(9) The relative phase and amplitudes of the chrominance portion of the signal are generally checked by observation on a vectorscope (fig 3-33c). The quadrature phase relationship between the I and Q components of the encoder signal can be conveniently checked by observation of the -I and Q signal axis.

(10) When making rapid checks of color television transmission systems, observation of the standard color bar signal waveform at the output of a transmission system can yield a number of clues with respect to the quality of the transmission system. The color bar signal is useful for checking transmission level, relative frequency response, and the presence of differential gain and phase.

5. One of the newer test equipment items developed for close inspection of amplitudes and phase of subcarrier signals is the vector display scope, commonly called the vectorscope. A block diagram of a typical vectorscope is shown in Figure 3-34. Generally this equipment uses a pair of quadrature demodulators. The demodulator outputs are applied to the X and Y plates of a DC scope. Most designs incorporate a burst-control oscillator to generate a reference subcarrier from the synchronizing burst of the signal under test.

Figure 3-34. Block diagram of a typical vector display oscilloscope

a. When used with color bar signals, the vectorscope produces a pattern of lines and dots which indicate the vectors corresponding to the various colors. The pattern appears as bright dots linked by relatively faint lines. As illustrated in Figure 3-35, boxes may be drawn on the oscilloscope face to indicate phase and amplitude tolerances.

Figure 3-35. Typical vector display oscilloscope pattern

b. The vectorscope must be used for making certain measurements on a color television system, particularly differential phase measurements. It is also an excellent tool for evaluating both luminance and chrominance channels of most video equipment.

6. The purpose and outstanding feature of the grating generator as applied to black and white television were discussed earlier in this lesson. Now we will examine its operation and functions as they pertain to color operation.

a. The cross-hatch pattern generated by the grating generator is extremely useful when making adjustments in the convergence of a color picture tube.

b. When viewing the picture area of the receiver, with the grating pattern applied, look for proper alignment of the vertical and horizontal bars. The convergence is properly adjusted if the bars are placed over one another and no color fringing is apparent.

Lesson 3
PRACTICE EXERCISE

1. What are the two voltage values of a video signal applied to a waveform monitor?
 - a. 0.7 volts and 0.3 volts
 - b. 0.714 volts and 0.286 volts
 - c. 0.8 volts and 0.2 volts
 - d. 0.814 volts and 0.186 volts
2. What is the output range of a radio frequency generator?
 - a. 10 MHz to 10 GHz
 - b. 20 KHz to 10 MHz
 - c. 10 KHz to 10 GHz
 - d. 20 KHz to 20 GHz
3. What is the overall frequency change called?
 - a. Frequency - modulation
 - b. Frequency swing
 - c. Attenuator
 - d. Waveform
4. What must happen to the input signal before you can make a frequency measurement reading?
 - a. Applied to the signal shaper
 - b. Sent to horizontal deflection
 - c. Sent to the vertical deflection
 - d. Sent to the time base
5. Why is it discouraged to use a multimeter to test transistors or diodes?
 - a. Accuracy not close enough
 - b. Frequency too low
 - c. Frequency too high
 - d. Meter can damage components
6. For what purpose is the video sweep marker generator used?
 - a. Frequency response of a given amplifier
 - b. Best picture
 - c. To set picture registration
 - d. Set gray scale reproduction

7. What test signal on the color bar generator is best to use, when checking color balance and tracking of color picture monitor?
 - a. Standard full field color bars
 - b. Split field red signal
 - c. Split field Y reference signal
 - d. Grating generator
8. What test instrument is used to make differential phase measurements of a color TV system?
 - a. Oscilloscope
 - b. Color bar generator
 - c. Video sweep marker generator
 - d. Vector scope

TELEVISION AUDIO SYSTEMS
(Developmental Date: 30 Sep 86)

SUBCOURSE NO. SS0603-6

U.S. ARMY SIGNAL SCHOOL
Fort Gordon, Georgia

Five Credit Hours

GENERAL

The Television Audio Systems subcourse is designed to teach the knowledge and skills for performing tasks related to operation and maintenance of the audio systems found in a typical television studio. Information is provided on several tasks which are performed at increasing levels of difficulty at Skill Levels 1, 2, and 3. Several of the tasks are shared with the MOS 84F, Audio/Television Specialist. However, the shared tasks do not appear on the Soldier's Manual, STP 11-26T13-SM-T6, dated September 1985, but they are published in the Soldier's Manual, STP 11-84F13-SM-TG dated September 1985. As a reminder, tasks with the prefix 113-575-XXXX are found in the MOS 26T manual and tasks with the prefix 113-577-XXXX are printed in the MOS 84F manual. The subcourse is presented in five lessons. Each lesson corresponding to a terminal objective as indicated below.

Lesson 1: DESCRIBE AND IDENTIFY THE AUDIO CONSOLE AND MAINTENANCE PROCEDURES REQUIRED TO TROUBLESHOOT AND REPAIR THE EQUIPMENT

TASK: Describe the functions of audio control consoles, and identify the equipment and maintenance procedures for troubleshooting and repair.

CONDITIONS: Given information and illustrations about terms relating to audio control consoles and troubleshooting and repair maintenance procedures.

STANDARDS: Demonstrate competency of the task skills and knowledges by correctly responding to 80 percent of the multiple-choice test items covering functions terminology and identification of audio control consoles and maintenance procedures for troubleshooting and repair.

(This objective supports Soldiers Manual Task 113-577-4001, Operate Turntable; 113-577-4006, Operate Studio Audio Console; 113-575-9002, Interpret Schematic Diagrams, Block Diagrams or Component Location Diagrams; and 113-577-9009, Perform Operator's Maintenance of a Turntable.)

Lesson 2: DESCRIBE AND IDENTIFY THE FOUR BASIC TYPES OF MICROPHONES AND THE MAINTENANCE PROCEDURES REQUIRED FOR PROPER OPERATION

TASK: Describe and identify the four basic types of microphones and the maintenance procedures required for proper operation.

CONDITIONS: Given information and illustrations about terms relating to the four basic types of microphones and the maintenance procedures required for proper operation.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80% of the multiple-choice test items covering terms relating to the four basic types of microphones and maintenance procedures required for proper operation.

(This objective supports these Soldier's Manual Tasks 113-577-1039, Select a Microphone; 113-577-1043, Set Up Microphones for Multiple Music Instrument Presentation; 113-577-1053, Establish Audio Requirements for Audio or Television Productions; 113-577-9003, Perform Operator's Maintenance of Microphones, Microphone Cables and Connectors; and 113-575-9002, Interpret Schematic Diagrams, Block Diagrams or Component Location Diagrams.)

Lesson 3: DESCRIBE AND IDENTIFY THE THREE MAIN FUNCTIONS AND THE THREE MAIN SECTIONS OF AUDIO TAPE RECORDERS AND THE MAINTENANCE PROCEDURES REQUIRED FOR PROPER OPERATION

TASK: Describe and identify the three main functions and the three main sections of audio tape recorders and the maintenance procedures required for proper operation.

CONDITION: Given information and illustrations about terms relating to the three main functions and three sections of an audio type recorder and maintenance procedures required for proper operation.

STANDARD: Demonstrate competency of the basic skills and knowledge by correctly responding to 80% of the multiple-choice test items relating to terms about the three main functions and three sections of an audio tape recorder and the maintenance procedures required for proper operation.

(This objective supports the Soldier's Manual Task 113-575-0042, Troubleshoot a Reel-to-Reel Audio Tape Recorder/Reproducer.)

Lesson 4: DESCRIBE AND IDENTIFY THE PRINCIPLES OF RADIO AND LINE TRANSMISSION, AM/FM CHARACTERISTICS, STEREO PHASE PROCEDURES AND THE ELECTRONIC REQUIREMENTS OF RADIO RECEIVERS

TASK: Describe and identify the principles of radio and line transmission, characteristics of AM/FM, stereo phase problems, and the electronic requirements of radio receivers.

CONDITIONS: Given information and illustrations relative to principles of radio line transmissions, AM/FM characteristics, stereo phase problems and electronic requirements of radio receivers.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80% of the multiple-choice test items covering principles of radio line transmission, AM/FM characteristics. Stereo phase problems and electronic requirements of radio receivers.

(This lesson supports these Soldier's Manual Tasks 113-575-4012, Replace RF Transmission Lines Between Antenna and RF Modulation, and 113-575-9002, Interpret Schematic Diagrams, Block Diagrams, or Component Location Diagrams.)

Lesson 5: DESCRIBE AND IDENTIFY COMPONENTS OF RECORDING SYSTEMS, AUDIO SPEAKERS, CABLE AND CORDS, AND USES OF BASIC MEASURING EQUIPMENT

TASK: Describe and identify components of recording systems, audio speakers, cable and cords, and uses of basic measuring equipment.

CONDITIONS: Given information and illustrations related to recording system components and audio speakers, cable and cords, and uses of basic measuring equipment.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80% of the multiple-choice test items covering identification of components of recording systems, audio speaker, cable and cords, and uses of basic measuring equipment.

(This objective supports Soldier's Manual Tasks 113-575-3033, Perform Measurement of the Visual and Audio Transmitter Carrier Frequency, and 113-577-9003, Perform Operator's Maintenance of Microphones, Microphone Cables and Connectors.)

INTRODUCTION TO TELEVISION AUDIO SYSTEMS

A radio/television systems specialist requires knowledge and skills in operation and maintenance of audio systems found in typical television studios which include production broadcast or Educational Television (ETV) facilities. It is important to understand the principles behind each piece of audio equipment and to be able to describe and identify the many items of audio equipment the 26T uses and maintains in a radio/TV operation.

LESSON 1

DESCRIBE AND IDENTIFY THE AUDIO CONSOLE AND MAINTENANCE PROCEDURES REQUIRED TO TROUBLESHOOT AND REPAIR THE EQUIPMENT

TASK

Describe the functions of audio control consoles, and identify the equipment and maintenance procedures for troubleshooting and repair.

CONDITIONS

Given information and illustrations about terms relating to audio control consoles and troubleshooting and repair maintenance procedures.

STANDARDS

Demonstrate competency of the task skills and knowledges by correctly responding to 80% of the multiple-choice test covering functions terminology and identification of audio control consoles and maintenance procedures for troubleshooting and repair.

Learning Event 1:

DESCRIBE AND IDENTIFY THE FUNCTIONS OF AUDIO AMPLIFIERS, SWITCHES, MIXERS, MONITORS, AND SIGNAL PATHS

1. Audio console. The audio console is the nerve center for the audio portion of TV production, just as the sync generator is the heart of the video equipment. However, the basic functions of these two are vastly different. Whereas the sync generator provides a standard, the audio console does much more. In this section, we shall see just how much more it does as we study the functions, signal paths, mixing action, and monitoring facilities, which are all a part of the audio console. An audio console is designed to handle audio signals from microphones, tape recorders, special effects consoles, and other sources as necessary for sound production.

2. Functions. There are many functions which could be listed; however, for our purposes here, we will consider those functions performed by amplifiers, switches, mixers, and monitors. Of course, for the console to carry out its functions, there must be certain auxiliary equipment attached, as indicated by various input and output terminations in Figure 1-1. Most consoles contain their own power supply.

a. You know that audio frequencies range from about 15Hz to 20KHz. Television (TV) equipments that amplify signals for sound reproduction use amplifiers designed for this low-frequency range. It is the task of such amplifiers to strengthen the audio signal and reproduce it faithfully. The dominant requirements are, therefore, gain and fidelity. The three types of audio amplifiers used in the audio console are the preamplifier, driver, and power amplifier. The following is a list of their functions.

b. Audio preamplifiers are designed to increase the gain of low-level signals from transducers such as microphones and recorder-reproducer heads. They are operated Class A at power levels in the order of micro-microwatts or microwatts. Since the signals are so very small, special attention must be given to the noise factor, input impedance, and coupling.

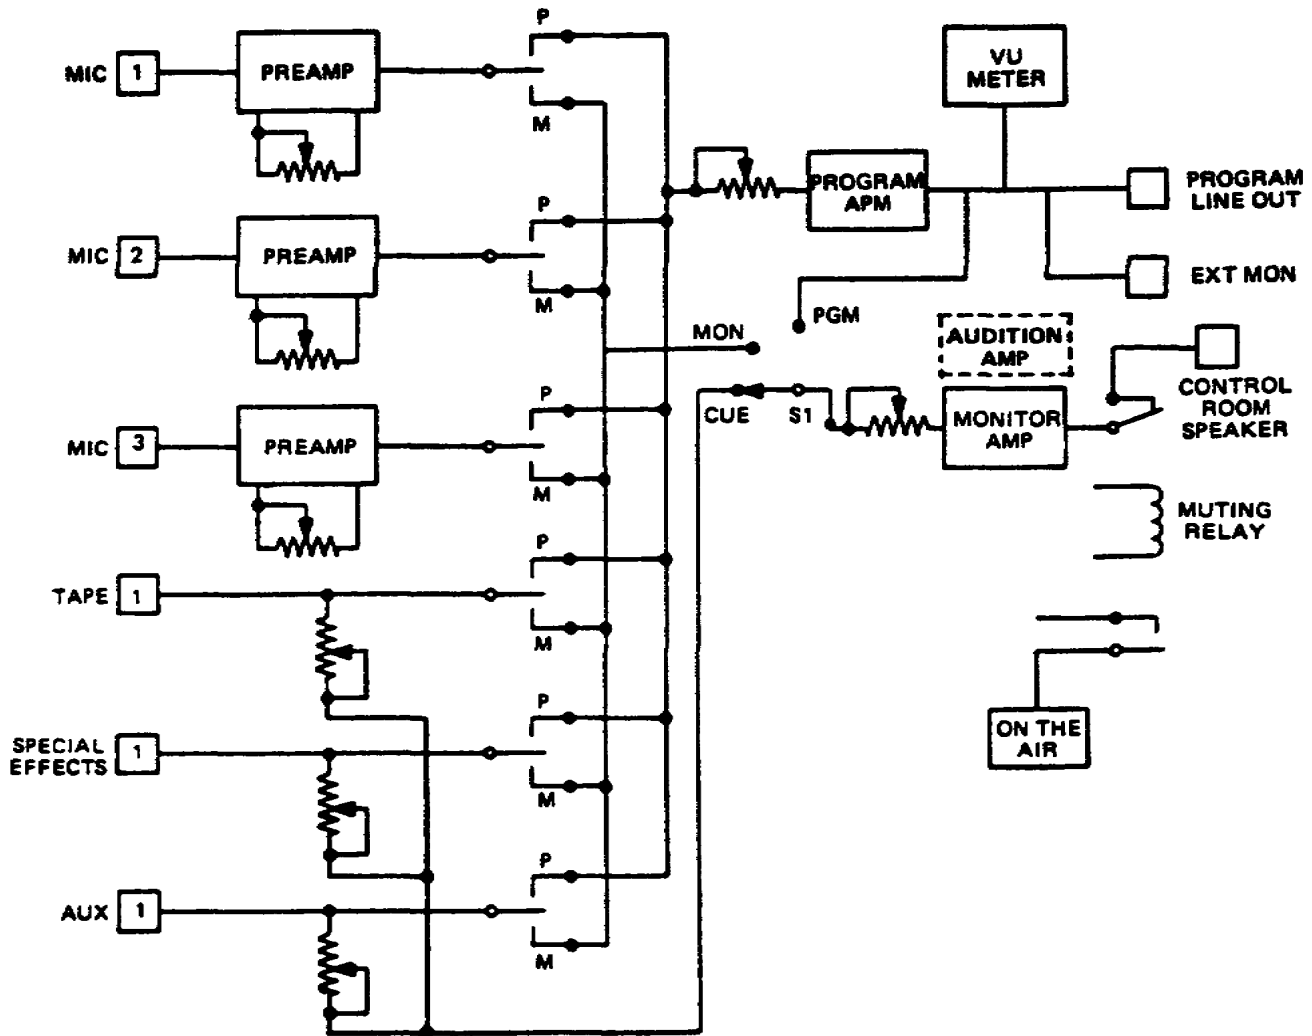

Figure 1-1. Block diagram of a basic audio console

c. Amplifier stages designed primarily to raise the power level of the signal-are known as drivers and power amplifiers. Driver stages usually develop power in the order of milliwatts. Power amplifiers develop watts or hundreds of milliwatts of power. This distinction based on power levels is approximate at best. The power levels of drivers and power amplifiers depend on the equipment in which they are used. A driver amplifier, as its name implies, is used to drive a succeeding stage. Thus, the driver states delivers power to another driver stage or to a power amplifier. The power amplifier builds the signal power to the necessary level to operate a device such as a speaker.

d. When microphones are discussed, you will find that the dynamic microphone is determined to have the best fidelity. However, this microphone requires a preamplifier (preamp) due to its low output voltage. Therefore, the audio console has built-in preamplifiers, which gives a sufficient signal level to drive the program and monitor amplifiers. The preamps used in this unit, as seen in Figure 1-1 have external gain controls, which are located on the front of the console along with the other input controls. These controls are actually labeled mixer. The program amplifier is also a multistage amplifier which falls in the class of a driver. This amplifier also has a gain control, which is the master control that enables the operator to adjust for the correct output level, as indicated on the VU meter. Microphones will be discussed in detail in Lesson 2.

e. The control consoles are equipped with a number of multiple contact double throw lever switches. These switches are used to perform a number of functions, some single and some multiple functions.

(1) The tape input is an example of a single function. When the switch is in either the program or monitor position, the only function is applying the tape signal to the respective amplifier. The microphone selector switches use an additional set of contacts to control the muting relay which removes the monitor speaker from the circuit. Also, the muting relay controls the on-the-air alert light.

(2) There are other switches, such as S1 which are used to select the various circuits to be monitored. There is a switch, not shown in Figure 1-1 which enables the operator to select what is wished to be monitored on the phone jack. It should be mentioned that Figure 1-1 is a block diagram of a simple console; the more elaborate control consoles have many more switches.

f. The mixers consist primarily of the variable attenuators which are incorporated with the various amplifiers. In the amplifier circuits, the mixers are nothing more than gain controls. In the tape input, auxiliary input, and special effects, they serve as gain controls for the cue circuit. or those who have not actually worked on a control console, there might be some question as to why they are termed "mixers." This can best be explained by saying that as one input signal is used to replace another, one signal is increased as the other is decreased. In this instance, the operator increases the gain on one input mixer control while decreasing the gain for the other. If two inputs are to be used at the same time, the two mixer controls are set

to give the proper balance or desired mixing of the signals coming into the console. They are also set to give the correct overall amount of output signal.

g. The console incorporates a VU meter, which is used to monitor the signal level out to the line and the external monitor. When you are using the mixer controls, the VU meter is very important for adjusting and maintaining the correct level out (fig 1-1).

(1) The headset monitor (not shown on the block diagram fig 1-1) is also used for adjusting balance; however, since the operator's sense of volume is not good enough to set the level out, the VU meter is needed.

(2) The various speaker connections also serve as monitors in the control room at remote locations and other miscellaneous installations. Like a headset, the speaker serves to give you an idea of the output level, but is not exact enough when adjusting for the correct level while monitoring tapes or live programs. We should mention that some of the control consoles have selective scale adjustments for the meters, whereas others require modification for the pad circuit to change the meter scale.

h. Again looking at Figure 1-1, you see there are a number of possible signal paths. In this diagram (fig 1-1), there are a total of six inputs and three outputs. Remember, this is a simple setup. There are many more inputs and outputs in the more elaborate setups that have talkback circuits incorporated for classroom work.

(1) In the diagram illustrated (fig 1-1), start with microphone No. 1, trace a signal path through the preamplifier, level selector switch (program P position), program amplifier, VU meter, line out pad or extension monitor pad to the output. If switch S1 was in the PGM position, the output from the program amplifier would also be coupled to the monitor amplifier and the control room speaker terminal.

(2) As shown in the diagram (fig 1-1), all of the input signals can be connected to the program amplifier and monitor amplifier at one time. Let us suppose you have a studio program that requires the use of all the microphones and also requires specific sound effects which are recorded on tape. In this case, you must use the cue position; a signal is fed to the monitor amplifier. At the right moment, you use the selector switch to send the signal to the program line. Thus the tape input is mixed into and becomes part of the program.

Learning Event 2:

DESCRIBE AND IDENTIFY THE PERFORMANCE ADJUSTMENTS REQUIRED TO PERFORM OPERATOR'S MAINTENANCE OF AN AUDIO CONSOLE

1. Performance adjustments. Three types of adjustments of primary concern are (1) elimination of hum in the circuits, (2) prevention of erratic action from switch contacts, and (3) accurate control of output.

a. We need to mention at this point that hum is usually not a problem with a transistorized control console. However, the tube type consoles with AC filaments are subject to hum distortion. To eliminate this problem, you need to adjust the hum balance control, which is found in the power supply section.

(1) To make the hum adjustment, set all input selector switches to the center or off position. If there is an input that cannot be turned off, it should be terminated in a resistance, since it may pick up hum in a manner similar to an antenna.

(2) After all input circuits are either off or terminated, turn the master gain all the way clockwise. If the preamplifier is in the circuit following the selector switch, turn the preamplifier gain or mixer to minimum, fully counterclockwise. Now you are ready to adjust the hum control for minimum hum in the output of the program line.

b. The switch contacts can be a source of much trouble due to their position in the line relative to the amplifiers.

(1) When a switch spring becomes bent, it does not close properly; therefore, you must adjust it for good contact.

(2) If a contact becomes burned or otherwise pitted, erratic action may result. Switch contacts should be checked carefully and adjusted or aligned for smooth action. This is true for both rotary and lever action switches.

c. When setting up the output level, the important thing to remember is that your accuracy can be no better than the VU meter reading. In other words, you cannot properly set the output unless your VU meter is accurate. Depending upon the console, you may find various methods of calibrating the VU meter.

(1) If you find the meter is improperly calibrated, it must be recalibrated against a known standard. In some cases, it is necessary to change the resistors in the pad circuit to get the correct VU meter calibration.

(2) You should realize the importance of output level control since this signal goes to a recorder, a live broadcast, or a live CCTV network. Therefore, any distortion which results from the overdriven output causes a loss of intelligence.

d. The troubles diagnosed here are only a few that may cause the symptoms described. Some of the troubles may have many other symptoms which enable you to determine the most likely cause of malfunction.

(1) As we have already mentioned, some of the hum problems are found in both transistor and tube-type sets. However, we know that troubles with hum are less frequent with transistor units, because they do not use heater voltages. Most of the hum picked up in a transistor unit are from the

preamplifiers, amplifiers, long microphone leads, and other types of inputs. The tube-type control consoles are different because of the AC filaments. The hum balance adjustment procedure has already been discussed; however, this adjustment suffices only if all components are in good condition.

(a) For example, if you attempt to make the hum adjustment and find that the control does not have any effect, there is another reason for the hum. In some models of the control console, the hum adjustment is nothing more than a DC voltage that can be varied from one side of the filaments to the other.

(b) In essence, this applies a positive potential on the filaments with respect to the cathode, causing a current from the cathode to the filaments rather than from filaments to cathode. Thus, any hum which might ordinarily be coupled from the filaments is blocked.

(c) Now if you cannot make the hum adjustment with the balance control, there is a good possibility that the voltage is missing from the hum balance adjust. Depending upon the console model, you may have as much as 40 volts at the center tap of the balance control. This voltage is usually obtained from a bleeder circuit in the B+ supply. Therefore, when there is a hum control failure, you should check the power supply voltage and the balance voltage source.

(2) Recall that the muting relay is used to mute the speaker. If this fails, sound may be fed back from the speaker to the microphone. There are two possible places to look for the cause of this trouble one is the relay which does the muting, and the other is the switch which controls the relay. Of course, you can easily determine whether the switch is faulty by using another selector switch to see whether or not the relay is activated.

(a) If the relay is activated and the speaker is muted, you know that the trouble is in the switch.

(b) If the relay is not activated, then it should be checked.

(c) Another thing to remember about sound feedback is that the higher audio frequencies usually cause more difficulties than the lower frequencies. Also, do not overlook the possibility of sound feedback from extension monitors in adjacent rooms. These sources of sound can also be troublesome.

e. Since the microphone is the signal source in an audio system, it can also be the source of troubles. The microphone in most all instances requires a preamplifier as indicated on the block diagram (fig 1-1). There are many troubles that are attributable to the microphone itself, such as broken cords, loose connections, and corroded terminals--all of which could cause weak or erratic output. This is in addition to any other internal damage to the microphone; and, of course, any of these symptoms could be localized to the microphone by substitution of a known good microphone.

(1) If the trouble is in the preamplifier, then of course it would be a matter of checking tubes and other items or perhaps circuit tracing the preamplifier.

(2) However, a weak signal would usually be caused by a weak tube in the circuit. Other possibilities, although less probable, are low B+, low filaments, components value change, and other minor items.

f. The mixer control is one part of the control console which is used extensively and causes some trouble during operation.

(1) The mixer or variable attenuator is nothing more than a gain control; therefore, it has a sliding arm contact.

(2) The sliding contact may become dirty and cause noisy operation of the control. This is very apparent in the gain rather than a smooth change. The trouble can be eliminated by cleaning the wiper arm contacts with a good contact cleaner, or some other cleaner as recommended by the manufacturer.

Learning Event 3:

DESCRIBE AND IDENTIFY THE EQUIPMENT USED IN A COMPLEX AUDIO CONSOLE

1. Complex audio console. The basic configuration of the equipment consists of a main audio console, an auxiliary mixer console, and an auxiliary control console.

a. At the main audio console, mixers are provided for four microphones, one turntable, one tape station, one network audio circuit, and one remote audio circuit, providing a total of eight. By means of lever keys, each program source may be switched to a program bus or on audition bus. Keys for the microphone positions also provide studio speaker control, so that the speaker is locked out during a broadcast. Talkback facilities allow communication to the studio, except during on-the-air periods.

(1) Twelve microphone circuits may be connected permanently to the console, and through the use of lever-type switches, four of the microphones can be assigned to preamplifiers and mixers. Each mixer output is controlled by a key-type switch, so that the output may be connected to either the program or the audition bus.

(2) Either of two methods may be used to connect the auxiliary mixer and the main audio console. By paralleling the audition and program buses of each, a total of eight microphone mixers are available. In addition, a speaker interlock circuit is provided on the audition-program switches.

(3) By connecting the program output of the auxiliary mixer, one master mixer and four subcontrol mixers are provided. Such a configuration is desirable when an orchestral program is to be broadcast. Proper instrument balance can be obtained by settings of the individual mixers, and the master mixer can be used to provide cutoff or fading of the entire group.

2. The auxiliary console primarily provides intercom facilities. In addition a VU meter with selector and attenuator, a turntable volume control with studio playback switch, and a spare attenuator also are provided.

a. The VU meter may be used to monitor other functions when the master console unit is in use.

b. The turntable volume control and studio playback switch provide a means of introducing background material into the program material. For example, when an actor "on camera" appears to be thinking of something having a direct bearing on the plot or program, the thoughts (previously tape recorded) can be played through the studio speaker. Additionally, the actor is able to coordinate actions and facial expressions properly by listening to the played-back material.

c. The intercom facilities provided by the auxiliary console are controlled by the six telephone ring-down circuits, which may be connected to outside points. An additional intercom is necessary to provide talkback facilities to the projection room, studio, announce booth, and order wire. The intercom system should include a microphone, a preamplifier, and relay control key-type switches. The keys should be located near the director's operating position.

Lesson 1
PRACTICE EXERCISE

1. The drive stage usually develops power in which of the following forms?
 - a. Milliseconds
 - b. Milliwatts
 - c. Miniohms
 - d. Millicurrents
2. Which of the following are parts of the audio console?
 - a. Vector scope
 - b. Sync generator
 - c. Monitor facility
 - d. TV monitor
3. The hum balance control is used to make which of the following adjustments?
 - a. Hum leveler adjust
 - b. Hum device adjust
 - c. Hum effect adjust
 - d. Hum adjustment
4. Which of the following causes the sound from the speaker to be fed back to the microphone?
 - a. The muting relay does not mute
 - b. The oscillating amplifier does not oscillate
 - c. The mixer control does not mix
 - d. The hum device does not eliminate hum
5. A mixer is sometimes called a
 - a. Scrambler
 - b. Wiper arm
 - c. Gain control
 - d. Muting relay
6. Which of the following is a monitor for the master console unit?
 - a. A television screen
 - b. A VU meter
 - c. A studio speaker
 - d. An intercom

LESSON 2
DESCRIBE AND IDENTIFY THE FOUR BASIC TYPES OF MICROPHONES-AND THE
MAINTENANCE PROCEDURES REQUIRED FOR PROPER OPERATIONS

TASK

Describe and identify the four basic types of microphones and the maintenance procedures required for proper operation.

CONDITIONS

Given information and illustrations about terms relating to the four basic types of microphones and the maintenance procedures required for proper operation.

STANDARD

Demonstrate competency of the task skills and knowledge by correctly responding to 80% of the multiple-choice test covering terms relating to the four basic types of microphones and maintenance procedures required for proper operation.

REFERENCES

None

Learning Event 1:

DESCRIBE AND IDENTIFY THE BASIC CONSTRUCTION OF THE FOUR BASIC TYPES OF MICROPHONES

1. Microphones. A microphone is a device which converts sound waves into an electrical signal, and applies this signal to an amplifying circuit. Following sufficient amplification, the electrical signal is used to drive a reproducer or to modulate a carrier frequency for transmission.
2. General Characteristics. The general characteristics of the most widely used types of microphones--dynamic, carbon, crystal, and capacitor--are discussed in this section. Each of these basic types of microphones uses a specific fundamental principle of operation.
3. Types of microphones. The basic operation of a microphone is dependent upon pressure of sound waves. The angles at which the sound waves strike the diaphragm of a microphone depend upon the positioning of the microphone in relation to the sound source. If the sound waves strike the diaphragm at different angles the pressure is different, this will cause the microphone to be directional in its frequency response. Most microphones are directional at

frequencies about 2000 Hz. Special construction of the microphone housing or case may produce additional directivity at frequencies below 2000 Hz. Examples of specially constructed microphones are the "shotgun" and "reflector" types. Nondirectional microphones also require special design considerations. For nondirectivity, it is necessary to so design the housing that signals from all directions exert uniform pressure on the diaphragm. The microphone which is designed for general purpose use is polydirectional; this type of microphone is usually mechanically adjustable to achieve the desired pattern of pickup.

4. Dynamic microphone. The dynamic or so-called moving-coil type is the most widely used. Because of its low (and adjustable) impedance, it can be installed with long cables without serious adverse effect to the overall audio system; it is not easily damaged by rough handling and is not particularly sensitive to blasts (instantaneous sound peaks).

a. A dynamic microphone contains a coil made of a large number of turns of extremely thin metal ribbon attached to the diaphragm. This coil is insulated from the diaphragm by a thin coat of insulating varnish. The coil extends from the diaphragm to a point between the poles of a powerful permanent magnet. When sound waves strike the diaphragm, the coil moves back and forth within the magnetic field between the poles of the permanent magnet and cuts the magnetic lines of force.

b. An illustration of a microphone designed to operate on this principle is shown in Figure 2-1a. This action induces a current in the coil in direct proportion to the sound pressure exerted on the diaphragm.

Figure 2-1. Dynamic microphone (A) mechanical details and (B) circuit diagram

c. The dynamic microphone elements are normally housed in a metal shell and covered with a metal grill and silk cloth to prevent damage from foreign particles and to minimize dust collection. The improvement in frequency response of this type of microphone over other types lies in the inclusion of an echo compensation circuit, which consists of an air chamber between the housing element and an air-vent tube; the length and diameter of the air-vent tube control the echo compensating action of the air chamber.

d. The impedance of the moving coil in the dynamic microphone is approximately 50 ohms; therefore, the coil may be connected to an amplifier by means of long cables. There are microphones available with built-in matching transformers to match low impedance of 30, 50, and 250 ohms or high impedance up to 50 kilohms. A switch is built in to select the various impedances. The frequency response of this type of microphone is reasonably flat over the range from 40 Hz to 10,000 Hz. Since the output voltage level is only about 0.00004 volt, a preamplifier must be used for adequate amplification. The circuit diagram of the dynamic (moving coil) microphone is illustrated in Figure 2-2B.

e. The ribbon microphone, a variation of the dynamic microphone using the moving coil principle, is widely used in studio operations. It has no real diaphragm, and its operation depends upon the velocity of air. Therefore, it is sometimes termed a "velocity" or "pressure gradient" microphone. The microphone, as shown by diagram in Figure 2-2A, consists of a powerful horseshoe-shaped electromagnet or permanent magnet, M, with special pole pieces between which a thin corrugated metal ribbon, R, is suspended. The ends of this ribbon are connected to the primary of a special step-up transformer.

f. The construction details of the ribbon microphone are illustrated in Figure 2-2B. The microphone should be so placed that the incoming sound strikes it at right angles, as those from the side have practically no effect. The sound striking the ribbon causes it to vibrate and thus cuts some of the magnetic lines of force between the pole piece. This action generates a voltage in the ribbon that is coupled to the grid of an amplifier via a special step-up transformer. Since the ribbon microphone is sensitive to velocity, it should be covered or otherwise shielded when used outdoors or in drafty areas, where air tends to produce undesirable ribbon vibrations.

Figure 2-2. Velocity microphone (A) circuit diagram and (B) construction details

g. The voltage output of the velocity microphone across 250 ohms is 0.0002 volt. The corrugated ribbon has a resistance of only a fraction of an ohm; therefore, the matching transformer is usually built into the microphone to reduce losses. The frequency response is practically flat from 30 to 15,000 Hz. The low impedance of the velocity microphone permits a long cable connection to the amplifier, but the cable must be well shielded because of the possibility of AC hum pickup.

5. Carbon microphone. The carbon microphone is widely used in intercommunications and cueing systems. In the carbon microphone, a constant direct current is permitted to flow through a mass of carbon granules. As sound waves vibrate the diaphragm, its resultant motion alternately compresses and releases pressure on the mass of carbon particles. The changing pressure on the carbon causes the resistance value of the total mass to change, thus permitting either more or less direct current passage. A cross section of a typical carbon microphone is shown in Figure 2-3A; A and B are heavy steel rings. The ridge in one and the groove, D, in the other hold the diaphragm, C, very tightly. The diaphragm is made of a very tough steel alloy and is generally designed to be from 0.001 to 0.002 inch thick. The small ring, G, is screwed into the large steel ring, B, to adjust the diaphragm tension, so that its natural period of vibration is above the desired audio frequency range. The central portion of the diaphragm is gold-plated on each side to

ensure good contact. The back of the microphone is closed, except for a series of holes that permit the air and sound to reach the back of the diaphragm. The bridge, E, extends across the opening in the front of the microphone and supports the front carbon granule cup, or button, F. A similar one is supported by the back. These carbon cups, or buttons, do not touch the diaphragm and are partly filled with fine carbon grains. The size of these grains determines the sensitivity of the instrument, and soft felt washers prevent the carbon from getting out of the cup.

a. Figure 2-3B illustrates both the mechanical structure and the equivalent electrical circuit of the simple single-button carbon microphone. The single-button carbon microphone is characterized by high output level and ruggedness. It is practically unaffected by heat and humidity. When space and weight are limited in an installation, its high output is advantageous because fewer amplifier circuits are required. The output ranges from 0.1 to 0.3 volt across a normal transformer impedance of 50 to 100 ohms.

b. To secure a more uniform response from various frequencies, the double-button type of carbon microphone, illustrated in Figure 2-3C, is generally used in place of the single-button type. As you can see, the diaphragm is placed between the two cups which contain carbon grains. Vibration causes the grains of carbon on one side of the diaphragm to be compressed; at the same time, it causes the grains of carbon on the opposite side of the diaphragm to be loosened. This action permits more current through the first carbon button than through the second. The output voltage of the double-button carbon microphone ranges from 0.02 to 0.07 volts across a normal transformer impedance of 200 ohms.

Figure 2-3. Carbon microphone (A) cross sectional view, (B) single-button circuit diagram, and (C) double-button circuit diagram

c. The frequency response is uniform from 60 to 1000 Hz. Above 1000 Hz, the response increases rapidly, becoming more than 15db higher at 2500 Hz than it was at 100 Hz. The response then remains uniform up to approximately 6000 Hz, where there is a marked falling off in response. Because of its poor response to the higher audio frequencies as well as its high noise level (hiss), the carbon microphone is not widely used for general television purposes.

6. Crystal microphone. The crystal microphone requires no energizing potential source such as the battery used with the carbon microphone. It requires no transformer or other coupling device. Its output, although not as high as the carbon microphone output, is adequate for direct application to the grid circuit of an amplifier. These features, plus its inherent simplicity and compact size, make this type of microphone unique among the devices designed to convert sound waves into electrical impulses.

a. Crystal microphones can be divided into two types--the diaphragm type and the sound cell type. The crystal element used in either type can be permanently damaged by high temperatures. This limits the number of useful applications. However, the crystal microphone is still widely used as a high-quality microphone for communications, both military and commercial. Figure 2-4A is a diagram showing the bimorph crystal unit; sound waves striking the diaphragm cause the diaphragm to vibrate. These vibrations are transferred to the surface of the crystal by means of the connecting pin. The fidelity of this type instrument is approximately equal to that of most double-button carbon microphones; however, the frequency response extends to a much higher range. In the crystal microphone, there is no background hiss or noise generated in the microphone itself. However, noise pickup on cables which are longer than 30 feet does limit the use of crystal microphones in television.

b. The sound cell is another type of crystal microphone, as shown in Figure 2-4B. The back-to-back crystal elements are enclosed within a rectangular bakelite frame sealed by two flexible membranes. No diaphragms are required in a sound cell microphone, because the membrane imparts the sound pressure directly to the crystals, which produce the resultant AC voltage.

Figure 2-4. Crystal microphone (A) cross sectional view of diaphragm and crystal and (B) cross sectional view of single sound cell unit

7. Capacitor microphone. A capacitor microphone generally consists of two electrodes separated by a very thin dielectric, usually air. One electrode is the diaphragm, while the other is a rigid plate which has the same area as the diaphragm. The diaphragm motion changes the spacing between the two electrodes, varying the capacitance.

a. If a DC voltage is applied across the combination, the changes in spacing produce changes in the capacitor charge which can be obtained as an AC voltage.

b. This device has a very linear pressure response and a wide frequency response and is relatively insensitive to mechanical noise because of its stiffness of construction.

c. The capacitor microphone requires an external power source and is adversely affected by high or changing humidity.

d. The output voltage is small; therefore, amplification is required, and the leads must be kept very short to avoid picking up stray field noise. New developments with solidstate amplifier built into the microphone housing have changed this situation.

8. Microphone Characteristics. The characteristics of the various microphones are summarized in Figure 2-5 which lists the various major types of microphones, together with their output level in dB and their frequency range in hertz. From Figure 2-5, you can see that from the standpoint of output level the carbon type is best and from the standpoint of frequency range the velocity type is best.

MICROPHONE TYPE	FREQUENCY RANGE IN CYCLES	SIGNAL-TO-NOISE	EXAMPLES OF OUTPUT IMPEDANCE	AVERAGE DB OUTPUT	VOLTAGE OUTPUT
DYNAMIC					
MOVING COIL	30 TO 20,000	MEDIUM	LO-Z 30, 60, & 260 HI-Z 50K	-55 TO -60	0.00004V
RIBBON	30 TO 20,000	MEDIUM	250 OHMS	-55 TO -60	0.0002V
CARBON					
SINGLE-BUTTON	70 TO 6000	LOW	50 TO 100 OHMS	-45	0.3V
DOUBLE-BUTTON	60 TO 6000	LOW	200 OHMS	-35 TO -45	0.07V
CRYSTAL	UP TO 14,000	HIGH	5 MEGOHMS	-50 TO -60	
CAPACITOR	20 TO 15,000	HIGH	30, 150 OR 600 OHMS	-63	

Figure 2-5. Comparison of microphones

Learning Event 2:

DESCRIBE AND IDENTIFY THE ADJUSTMENTS AND MAINTENANCE REQUIRED FOR PROPER MICROPHONE OPERATION

1. Microphone adjustments. It should be said that most of the difficulties with microphones are caused by misuse or careless handling. Nevertheless, let us mention a few adjustments that can be made on a microphone. The polydirectional microphone may be any of the basic types which have an adjustable aperture. When the aperture is fully open, the microphone has a bidirectional pattern; when the aperture is closed, the microphone is nondirectional. At shutter settings between the open and closed positions, the microphone is unidirectional. Some microphones are designed with blast filters which are adjustable and require settings commensurate with the operating conditions.

2. Microphone maintenance. The maintenance of microphones is-not so much in the microphone-itself but rather in the cords and connectors. If, for instance, you were told a carbon microphone did not have an adequate output, the first thing you should check is the carbon granules for a "packed" condition. This condition is caused by excessive current which causes the carbon granules to stick. Carbon granules that are packed can sometimes be loosened if you turn off the applied current and shake the microphone while holding it in various positions. If this does not correct the situation, you may have to replace the carbon granule mass. Do not shake a dynamic microphone, as this will not accomplish anything desirable and may damage the internal unit.

Lesson 2
PRACTICE EXERCISE

1. What are the four basic types of microphones?
 - a. Steel ring, attenuator, coil, magnet
 - b. Dynamic capacitor, crystal, carbon
 - c. Grill, pressure, directivity, shotgun
 - d. Diamond, resistor, tube, air-vented

2. What is the approximate impedance of the moving coil in the dynamic microphone?
 - a. 50 ohms
 - b. 75 ohms
 - c. 10 ohms
 - d. 100 ohms

3. Which of the following microphone has the highest output level?
 - a. Carbon
 - b. Crystal
 - c. Diamond
 - d. Velocity

4. Which of the following is a variation of the dynamic microphone?
 - a. Ribbon
 - b. Diamond
 - c. Carbon
 - d. Capacitor

LESSON 3
DESCRIBE AND IDENTIFY THE THREE MAIN FUNCTIONS AND
THE THREE MAIN SECTIONS OF AUDIO TAPE RECORDERS AND
THE MAINTENANCE PROCEDURES REQUIRED FOR PROPER OPERATIONS

TASK

Describe and identify the three main functions and the three main sections of audio tape recorders and the maintenance procedures required for proper operations.

CONDITIONS

Given information and illustrations about terms relating to the three main functions and three main sections of an audio tape recorder and maintenance procedures required for proper operations.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 80% of the multiple-choice test relating to terms about the three main functions and the three main sections of an audio tape recorder and the maintenance procedures required for proper operation.

REFERENCES

None

Learning Event 1:

DESCRIBE AND IDENTIFY THE THREE MAIN FUNCTIONS AND THREE MAIN SECTIONS OF AN AUDIO TAPE RECORDER

1. Audio tape recorders. Perhaps you own a home tape recorder and have performed minor maintenance on it. In this section you are concerned with audio tape machines as they apply to TV production. You will notice that the terms "audio tape recorders" and "audio tape machines" are used interchangeably in this material. In the audio tape recording field, there is a difference in the tape player and tape recorder. A tape player can combine the three functions of erasing, recording, and playing back audio frequencies, the same as a home variety tape recorder. A tape recorder is usually limited to the erasing and recording of audio frequencies.
2. Audio Tape Machine. For our discussion, we have divided the audio tape machine into three main sections: transport mechanism, heads, and electronics. In the following discussion you will find variations in the functions of each

of these main sections. For example, the tape heads are identified according to their functions of erasing, recording, or playback.

a. All of the tape machines require some type of mechanism to move the tape past the record and playback heads. Such mechanisms have been given various names, but "tape transport" seems to be generally accepted as standard. "Tape handlers" is the term used to designate machines designed for fast start-stop operation. These fast start-stop machines are usually a type of computer or laboratory tape transport which require the tape to start or stop instantaneously. In contrast, the standard machine requires about 1 second to reach full speed and perhaps 5 to 10 seconds to fully stabilize.

(1) A good quality tape transport has the features of the mechanism illustrated in Figure 3-1. These features include the tape supply reel, which is provided with either a friction brake or an active back torque. The back torque is supplied by the drive system or a torque motor. Back tension (torque) is necessary to keep the tape from becoming tangled due to the inertia of the tape reel. The tension idler holds a certain amount of tape in its loop; this spare amount of tape is temporarily let out during quick starts. A slight delay in time is allowed for the supply reel, which has appreciable inertia, to start turning at operating speed. The tension idler and back torque work together to smooth out irregularities caused by the rubbing of the tape against the supply reel sides, sticking together of tape layers, or other causes.

(2) Again looking at Figure 3-1, note that the tape is drawn from the tension idler, across the rolling tape guide erase head, tape guide, record head, tape guide, and reproduce head. The force, which draws the tape across the heads at a constant speed, is provided by the capstan and the capstan pressure roller. The combination of the capstan, the tension idler, and reverse torque of the supply reel keeps the tape under constant tension. There is friction between the tape and the stationary heads. This friction is a source of vibration. Attempts to eliminate this vibration are included in the design of the transport mechanism by using a rigid base on which to mount the transport components. Other causes of vibration are the amount of wrap around the head, smoothness of head faces, tape tensions, tape condition, tape composition, temperature, and humidity. The capstan may be either the shaft of the drive motor or a shaft driven through a speed-reducing mechanism. The capstan and any associated mechanism must be made with precision, or it causes problems during both record and playback. This requirement for precision components includes the drive motor, as it must drive the capstan mechanism at a constant speed.

Figure 3-1a. Tape transport mechanism (record mode)

Figure 3-1b. Tape transport mechanism (erase mode)

Figure 3-1c. Tape transport mechanism (reproduce mode)

(3) Immediately following the capstan and the capstan pressure roller is another tape guide. Each tape guide serves to keep the tape in alignment with the heads at all times. If the tape guides permit any vertical variation of the tape, a possibility exists of attenuation of the recorded signal during reproduction. In extreme cases the signal could be lost entirely, or the erase head would either fail to erase or improperly erase when a recording is made. The tension idler near the takeup reel serves the same purpose as the other tension idler. The torque on the takeup reel changes according to the amount of tape on the reel.

b. Three tape heads may be used on the more expensive tape machines. Some machines, such as those designed for home use, use the same head for recording and reproducing.

(1) The basic construction of tape heads is the same--that is, the head consists of a core of permeable material which is wound with a coil of wire (fig 3-2). This core of permeable material is formed into a contact. The core material is usually of a laminated construction (fig 3-3) rather than nonlaminated. The nonlaminated heads are cheaper to construct, but they usually produce poor results. The laminations, produce a better response to higher frequencies by reducing magnetic losses due to eddy currents.

(2) The core of the head is wound with a number of turns of wire, but the number of turns depends upon the purpose for which the head is designed. The manner in which the core is wound is dictated by the head use; also, two windings may be used. Most of the newer heads follow the two-winding design, one winding on each side of the gap. In most of the newer designs, the two windings are terminated externally, thus they may be connected in a parallel or series arrangement as desired. The core and winding are enclosed in a protective metal housing to prevent the winding from picking up hum emanating from motors, transformers, etc.

Figure 3-2. Construction of magnetic head

Figure 3-3. Laminated core tape head

c. So far, all of the heads under discussion have been of the electromagnetic type. To further expand on the erase head, some are constructed to use either a single permanent magnet or a series of permanent magnets to set up a magnetic field.

(1) If a single magnet is used, the tape is erased by the magnetic flux.

(2) However, with more than one magnet, the tape is erased by the changing cycles of the magnetic flux fields.

(3) The more popular erase heads are those which use a high-frequency current to create an AC magnetic flux. This current is supplied by the bias oscillator, which also provides the bias current to the record head, where the magnetic flux lines penetrate the magnetic coating of the tape (fig 3-4). The AC erase head has fewer turns of wire than the standard playback head, and it passes current easier and operates better at the higher frequencies.

Figure 3-4. Action of high-frequency erase head

(4) Another feature of an AC erase head is a wider gap which permits the tape particles to change direction more times, thus giving a more complete erasure of the tape.

(5) Notice that as the tape approaches and then leaves the gap in the head, the erase action builds up from zero to maximum and back to zero. Thus, any magnetic pattern which was previously recorded is obliterated by the action of the high-frequency bias oscillator.

d. When an alternating current is sent through the winding of a record head, a magnetic field corresponding to the applied current is produced in the core (fig 3-5). The magnetic field has a great deal of difficulty passing through the nonmagnetic gap in the core. However, when the magnetic coating of the tape closes the gap, the field can easily complete its journey via the tape. The tape now becomes magnetized in accordance with the fluctuations of applied current.

Figure 3-5. Flux lines in a recording gap

(1) The magnetic fluctuation of the tape continues until the instant the tape passes the trailing edge of the gap. The magnetic orientation at the instant of departure from the gap edge is the pattern that remains on the tape. For the best possible recording, the trailing edge of the gap should be as straight and sharp as possible. A principle difference between heads of poor quality and high quality is the definition of the gap edge. The amount of electrical signal required to produce a certain amount of magnetic flux on one head may create a stronger magnetic flux on another head because of differences in efficiency or elements of design. The signal level that causes distortion varies among heads of different manufacturers. You must take these factors into account if you substitute a different make or model of head for the one that originally came with the tape recorder.

(2) As the signal current is fed to the head; the high-frequency bias current is supplied simultaneously to the head (fig 3-6). The residual magnetization of the tape is accomplished by passing the signal current, plus a high-frequency bias current, through the recording head winding. This technique is referred to as direct recording.

Figure 3-6. Recording with high-frequency bias

(3) The high frequency of the bias oscillator serves to activate the head over the linear portion of its magnetization curve. The linear operation puts the audio signal in a magnetization area for the most faithful recording. If, however, the bias signal is increased until the head is saturated, the linear operation is disturbed. The final magnetization produced in the tape is determined by the last flux encountered close to the trailing edge of the gap as the tape leaves the gap area. For this reason, the length of the recording gap is not as critical, within limits, for recording heads as it is for reproducing heads. The recording heads usually have a gap in the range of 0.0005 to as much as 0.001.

e. Certain features of the playback (reproduce) head are required to provide full response to the audio frequencies. One requirement is that the head gap be very narrow; that is, 0.0001 inch or smaller. A large number

of turns of wire is required in the winding since the head must be sensitive to the changes in flux recorded on the tape. The playback head functions in an opposite manner to the record head; that is, the tape induces a flux into the head core. The flux passing through the core induces a voltage into the winding, causing current in the associated circuit. This signal current is amplified by the playback amplifier for operation of speakers, headphones, or other devices. The playback head is of prime importance in the faithful reproduction of a recorded signal. For example, if we assume that a head is good mechanically, and it is playing back a signal which has all frequencies recorded with equal magnitude, we will find that the higher audio frequencies will produce a greater voltage output.

(1) An inherent characteristic of a playback head is that the rise in output is proportional to the rise in frequency response. However, remember that although a new head may have a narrow gap, as the head wears, the gap becomes wider, and as a result, the high-frequency response drops off.

(2) Also, along with gap width, the definition of the edge of the head must be smooth to produce high frequencies. If the edges of the gap are not straight and sharp, the gap behaves magnetically as though it were much wider than its physical dimensions.

f. Other factors which affect the frequency response of the head are tape speed, smoothness of the tape, pressure of the tape against the head, and quality of the tape. The tape speed is important because the more rapidly the changes in flux are drawn across the head gap, the stronger the voltage induced into the head gap, and the stronger the voltage induced into the head windings. This added strength, in turn, gives improved frequency response to the recorded signal. You can understand this condition if you consider that a slow moving tape causes the head to see an average change in the flux and not each small change, which is necessary to reproduce high frequencies. Smoothness of the tape and tape-to-head contact are directly related in their effect on frequency response as well as voltage output. If the tape is rough, the magnetic particles are not maintained constantly closed to the head, which is necessary to induce a smooth flow of flux variations. The rough spots or portions of the tape move the particles farther from the head and cause weakening of the flux changes; thus, the high frequencies are lost. Carrying this through further, you can understand that the same losses are prevalent if the pressure holding the tape against the head is weak.

Learning Event 2:

DESCRIBE AND IDENTIFY MAINTENANCE PROCEDURES FOR PROPER OPERATION OF AN AUDIO TAPE RECORDER

1. Electronics. Typical electronic circuits used in tape recording are indicated in Figure 3-7. There are certain refinements as dictated by performance requirements. Normally, the higher the frequency response required, the better the overall quality of the circuit components. Even though the record head requires very little drive power, the need for bias injection, impedance matching, and possible preemphasis makes it important to use the correctly

designed amplifiers in the recorder. In recorders, there is a requirement for voltage equalization of frequencies in the output. Earlier we said that the higher the frequency, the more the voltage output; for the lower frequencies, the opposite is true. Therefore, the very weak, low frequencies must be boosted. It is not enough to increase the gain of the amplifiers. The problem is to boost the low frequencies and limit the high frequencies. In most instances, it is sufficient to add RC networks to the input signal path of an amplifier. To attenuate the high frequencies, RC network values are selections that result in bypassing a major portion of voltage of the higher frequencies to ground. The reduction of the higher frequencies input voltage of an amplifier results in a relative boost of the lower frequency voltage. Frequency-selective feedback circuits between amplifier stages may also be used to equalize the output voltages of the high and low frequencies. Many variations of equalization circuits are used in both playback and record amplifiers.

Figure 3-7. Typical record and bias oscillator circuits

2. Trouble diagnosis. To diagnose troubles in a tape machine, you need to remember that a combination of features can cause trouble. In a tape machine, you have a group of mechanical functions as well as the various electrical circuits. Indications obtained from the electrical circuits point to most of the troubles. These troubles may or may not be in the mechanical mechanism, but you must "read through" the troubles to make your diagnosis. Once you detect a malfunction, you should look immediately for the cause; however, a quick mental reference to the most common troubles and their causes should speed your diagnosis.

3. Variations of speed. Identifying "wow" and "flutter." The word "wow" is used to describe a slow variation of speed, whereas, "flutter" describes a fast variation of speed. If the speed is consistently wrong, the audio signal is off pitch. This condition is easily recognized with music but can be difficult to determine with spoken words.

a. A "wow" could be caused by certain faults, such as a slipping belt, a lack of proper pressure on the capstan motor winding damage, or an uneven tape surface.

b. A "flutter," which is much faster, would more likely be caused by something moving at a higher speed. The capstan could be out of round and give this fault with every revolution.

c. Sometimes a tape guide can cause a bouncing action to be repeated at a fast rate. A signal which is consistently off pitch or key may be caused by insufficient or excessive drag on the tape as it passes through the transport system. This could be incorrect action of the supply reel, the pressure pads, tape guides, or improper threading of the machine.

4. Weak outputs. If you have an indication that the output seems to be weak, or that it is not giving full response to the higher frequencies, you might look for electrical trouble. Pause for a moment and think what would happen if you have only a portion of a track passing over a head. We know that the strength of the output signal is relative to the magnetic influx recorded on the tape and the tape speed. You already know that head wear causes a drop in high-frequency response, but if the track or head is misaligned, you will not get full benefit from the recorded signal. You may need to check head wear, track, and head alignment. If these seem to be correct, then check the circuit components. Again, you can solve many of the tape machine problems by "reading" the symptoms and making a logical conclusion.

a. For still another example of a problem, let us assume that when you make an audio recording and play it back, you don't get a signal. There are two ways to start checking. Use a known good machine to check the tape or a known good tape to check the machine. If you determine that the trouble is in the record or playback portion, you should proceed to check out the items in those sections.

b. If the trouble is in the record circuits, you may check the input source or the bias oscillator; either one could cause a failure in the record mode.

c. If the bias oscillator is not working and the machine uses this same signal to erase the tape, a recorded tape would not be erased prior to a new recording. This is one quick check of the bias oscillator.

d. A substitute microphone can be used to make a quick check of the input source. Many recorders have a monitor jack which can be used to determine whether a signal is being fed into the recorder. Most recorders have a record indicator, either a light or a meter, which gives a visual indication of the input. By checking the circuit of the recorder in use, you can, through a process of elimination, narrow the area of trouble to a limited number of stages.

e. From this point, it is necessary to make the more routine checks of tubes and other components. To prevent head magnetization, do not check the continuity of heads with an ohmmeter.

f. The following check list is suggested for locating the cause of poor high-frequency response due to head problems.

(1) Check azimuth alignment with an alignment tape.

(2) Check for tape skewing which seems to occur simultaneously with amplitude fluctuations.

(3) Check to be sure the head meets the tape squarely.

(4) Check for stability of the tape path in its guides.

(5) Check for foreign deposits, nicks, or gauges on the head surface.

(6) Check for "breakthrough" in the head gap. A magnifying glass or microscope is helpful.

(7) Check for uneven wear.

(8) Replace the head if necessary.

4. Playback problems. A trouble in the playback circuits is most readily found by using a known good tape for playback. With some machines you have an intermediate output which can be checked to determine whether or not the signal is reaching a given point in the machine.

a. Some machines have a visual output indicator; if you have this type, you know that all circuits are good up to a stage prior to the power output; here, all but the last stage could be eliminated as the source of trouble.

b. In all cases, it is a matter of taking logical steps toward localizing the trouble to an area, to a circuit, and finally, to a component or components.

Lesson 3
PRACTICE EXERCISE

1. Erasing and recording are the two main functions of which of the following?
 - a. TV monitor
 - b. Camera chain
 - c. Tape recorder
 - d. Video selector
2. What are tape handlers?
 - a. People who have a degree in handling tapes
 - b. A term used to designate machines designed for fast start-stop operation
 - c. A machine designed to repair tape and play it back for proper operation
 - d. A term used to designate machines designed for automatic rewind
3. What is the purpose of the tape guide?
 - a. To guide the tape at a constant speed
 - b. To guide the tape to the tension idler
 - c. To permit vertical variation of the tape
 - d. To align the tape with the heads
4. How is a tape erased if the erase head is constructed of a single magnet?
 - a. By magnetic loss
 - b. By magnetic oscillation
 - c. By magnetic flux
 - d. By magnetic current
5. What do you do after a malfunction has been detected?
 - a. Report it to your supervisor
 - b. Look for the cause
 - c. Reduce the input voltage
 - d. Change the fuses
6. Which of the following statements describe the word "flutter?"
 - a. A broken audio signal
 - b. Moderate variation of speed
 - c. A fast variation of speed
 - d. A slow variation of speed

LESSON 4
DESCRIBE AND IDENTIFY THE PRINCIPLES OF RADIO AND
LINE TRANSMISSION, AM/FM CHARACTERISTICS, STEREO PHASE
PROBLEM, AND THE ELECTRONIC REQUIREMENTS OF RADIO RECEIVERS

TASK

Describe and identify the principles of radio and line transmission, characteristics of AM and FM stereo phase problems and the electronic requirements of radio receivers.

CONDITIONS

Given information and illustrations relating to principles of radio line transmissions, AM and FM characteristics, stereo phase problems and electronic requirements and radio receiver.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 80% of the multiple-choice test covering principles of radio line transmission, AM and FM characteristics, stereo phase problems, and electronic requirements of radio receivers.

REFERENCES

None

Learning Event 1:

DESCRIBE AND IDENTIFY THE PRINCIPLES OF RADIO AND LINE TRANSMISSIONS

1. Transmission of sound. Radio communications include transmission of signals through space to a point of reception from a point of origin not connected by wires. This is accomplished by the use of microphones to convert sound waves into patterns of electrical energy. This energy is amplified and modulated by transmitting apparatus and broadcast on radio frequencies into the air. At the point of reception, the electrical patterns are converted by sound waves, which emerge from the loudspeaker.
2. Modulate. To modulate means to regulate or adjust within a communication system, modulation has three very important functions.
 - a. It converts electrical signals from information; it sends multiple channels of information over one communication line (multiplexing) and it makes radio transmission possible.

b. A good example of a single amplitude modulated system is the fuel-level indicator system used in most cars. The fuel-level (the information) regulates the amplitude of an electrical current which is then transmitted to an indicator on the dash-board panel. Thus the current is said to 'carry' the information and is therefore referred to as the carrier.

c. AM adds range to a signal in the radio frequency range. The audio information in this procedure is identified as a modulating signal; the radio frequency signal is called the carrier. The purpose of the carrier is to get the message delivered. In other words, the carrier, as its name indicates, carries the information to the receiver from the transmitter. The amplitude of the carrier signal varies as the information varies (fig 4-1).

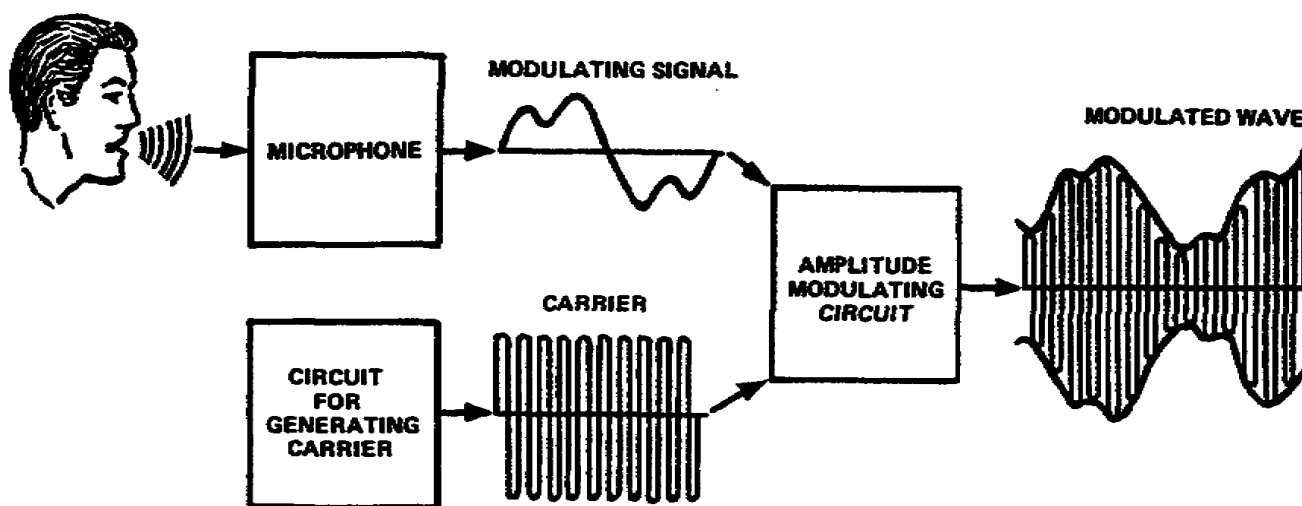

Figure 4-1. The amplitude modulating process. A modulating signal in the audio frequency range is imposed upon an RF carrier signal. The result is the modulated carrier signal

d. We've discussed two signals, one being the modulation signal, the other the carrier signal. These signals combined function at the carrier frequency. These signals are not alone when transmitting a modulated carrier, because when two electrical signals are combined they produce other signals. This process is called heterodyning, and as a result we get two other signals. One is developed when the carrier signal is mixed or added to information or intelligence frequency, and is called the upper sideband frequency. If one of these signals are deleted then what is remaining is called the lower sideband frequency.

e. If these three frequencies are combined (upper and lower sidebands and the original carrier) they form what is known as the modulated carrier signal. If a single frequency for the modulated signal changes, then there will be a pair of sidebands created for every new frequency. When more sidebands are added to the carrier, the modulated signal needs more space in which to operate in the broadcast band.

3. Heterodyne Process. Figure 4-2 is a block diagram of a superheterodyne radio-receiver. This receiver produces a carrier at a new frequency, keeping the information being transmitted unchanged.

a. To help you understand how the superheterodyne radio works, look at the section of the radio in which all of the tuning and station selection occurs (consists of the RF amplifier, the mixer, and the local oscillator). This section of the receiver receives the signal being broadcasted, heterodyne this signal with the one that is produced in the local oscillator and a third signal is produced called the Intermediate Frequency (IF) signal. This IF signal is processed through the radio and soon the original broadcasted information is heard coming out of the speaker.

b. Figure 4-2 illustrates two carrier signals being mixed in the superheterodyne system (receiver). F_1 and F_2 will be heterodyned in the mixer block of the receiver, and the result is the production of four signals. They are: F_1 at 1.5 MHz, F_2 at 1 MHz, the sum of the two signals ($F_1 + F_2$) or 2.5 MHz, and the difference of the two signals ($F_1 - F_2$) or 0.5 MHz. If, however, the incoming signal at F_2 was modulated, then both the sum and the difference signal would contain modulation.

Figure 4-2. The heterodyning process produces four signals through the action of the mixer stage

4. AM's disadvantage. AM's biggest disadvantage, to be discussed further in the next learning event, is that electrical discharges in the air allows the carrier to be amplitude-modulated. As a result the listener hears interference and static and very often noise will override the modulation and interrupt the broadcast signal rather than the amplitude. The limiter block in the receiver cuts off any and all amplitude modulation intelligence upon receiving a frequency modulation signal.

Learning Event 2

DESCRIBE AND IDENTIFY THE CHARACTERISTICS OF AM RADIO

1. AM radio signal. The AM signal is one of the first kinds of transmission of radio signals. The information being broadcast by the station is varied in step with the amplifier of the transmitted signal. This type of system is what we know today as the superheterodyne radio.

a. The superheterodyne radio has several particular functions (fig 4-2). All of the functions are similar regardless of the components used in the radio. Therefore, whether the radio was a transistor solid-state or a vacuum-tube type, they both use the same functional diagram. We can go on to say that the electronic signal received from the transmitting source or station are processed the same whether the radio is transistorized or vacuum tube.

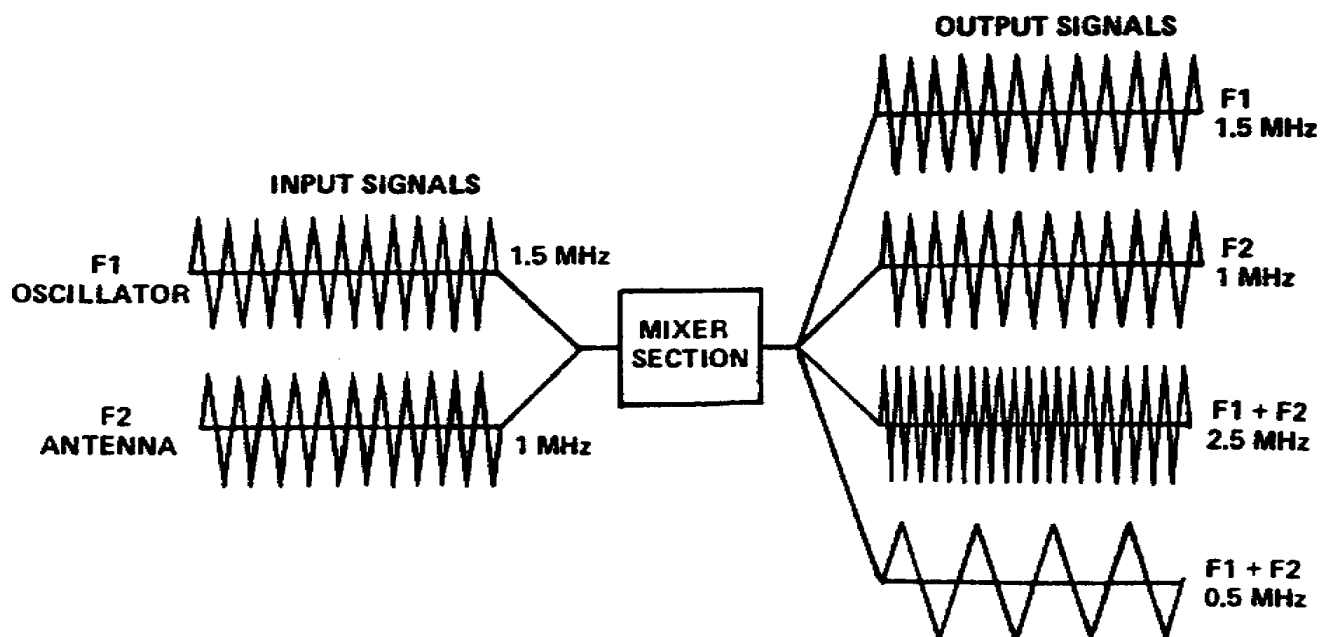

Figure 4-3. The AM radio block diagram

b. The AM superheterodyne radio works by a transmitted signal which is picked up by the antenna, processed through the set to the speaker as follows:

(1) The main purpose of the antenna is to pick up a broadcast signal and take that signal into the receiver for processing into sound waves.

(2) The "radio frequency amplifier" does what its name says. This amplifier is designed to operate in the radio frequency range. The amplifier provides for tuning or selecting a specific frequency and it amplifies the signal received in this frequency. The output goes to the mixer block.

(3) The "local oscillator" produces an electronic signal of its own. This signal is sent to the mixer block and is tunable. The main purpose of this block is to provide the electronic signal that is generated in the radio receiver. The electronic signal will mix with the signal selected by tuning elements in the RF amplifier. Newer models have a single knob that will allow for the tuning of the RF amplifier and the local oscillator at the same time.

(4) The mixer receives signals from the amplifier and the local oscillator. These signals are then mixed together electronically and as a result, there is a third signal produced. This third signal is known as the IF, or Intermediate Frequency signal. The IF signal operates on a frequency 455KHz for the AM radio. The IF amplifier block processes the signal that contains the same information as the receiver from the broadcast station, along with a signal known as the carrier.

(5) The "IF" or "Intermediated Frequency" is the output frequency from the mixer. This frequency is normally a fixed frequency where the superheterodyne receiver is concerned. Because the IF amplifier can be tuned for excellent performance, it is easy to acquire high gain and optimum selectivity.

2. AM carrier transmission. So far the radio we've been discussing has processed a signal containing two parts. One part consists of the intelligent information such as voice or music and the other part is the carrier. As stated previously, the carrier carries the information from the transmitter to the receiver at a certain frequency (each broadcast station operates at its own carrier frequency).

a. After the carrier transmits the information to the receiver, the carrier itself is processed along with the information through the mixer. This operation produces another carrier at the IF frequency.

b. This new carrier has included in it the information that is sent out on the broadcast station's carrier. Also, the intelligence contained in the IF carrier is sent through the IF amplifier to the "detector."

c. The carrier, after this process, is not needed for any reason; therefore, the radio acts as though this signal no longer exists. The detector's job at this point is to separate the carrier from the information, thus sending the information portion to the audio amplifier.

d. The input of the "audio amplifier" is designed to accept a tiny electrical signal. The electrical design of this block is able to amplify the electronic signal and apply enough power to operate the loudspeaker.

e. The "power supply" of all electronic devices are designed to provide certain operating voltages and currents from external sources, i.e., line voltage, battery, etc.

f. The "Automatic Gain Control" or "AGC" will compensate for the different signal strength levels sent to the radio receiver from the transmitter, and at the same time the AGC system monitors the amplification of the detector's signal. At this point the AGC returns a portion of the detected signal to the IF, and if RF amplifiers are either too high or too low, the AGC will act to either decrease or increase the amplification at these stages.

Learning Event 3:

DESCRIBE AND IDENTIFY THE CHARACTERISTICS OF FM RADIO

1. FM radio. The antenna serves the same purpose as it does in the AM radio; however, the "radio frequency" amplifier performs a dual function in the FM radio.

a. The first is to choose the incoming signal and then amplify this signal to a height that will allow the rest of the radio receiver to process it. This amplifier acts the same in an FM receiver as in an AM receiver, although some of the basic circuitry is different because of the different frequencies being received. In other words, the RF amplifier's function is the same in the AM radio and the FM radio, with the only difference being the frequency to be processed.

b. The purpose of the mixer is the same as in the AM radio. It mixes, as its name states, the signal received which contains the carrier signal with the signal from the local oscillator. These signals mixed together produce a third signal called the IF or Intermediate Frequency. This signal contains the IF carrier and operates on a frequency of 10.7 megahertz, and the intelligence found on the broadcast stations carrier.

c. The local oscillator generates a tunable electronic signal. This signal and the incoming signal in the RF amplifier are tuned at the same rate. The main purpose of the local oscillator is to generate and inject a carrier signal into the mixer block to develop the two signals which are required to produce the third signal known as the IF signal. The signal of 10.7 megahertz is produced in the mixer stage, and contains in it the carrier and the intelligence received from the broadcast station. This amplifier amplifies the signal from the very low level at the output of the mixer through several stages in order to get a large signal for the detector.

d. The limiter's functions is to expose the detector to a signal of constant amplitude. This process eliminates unwanted information in the signal, such as static, before it goes to the detector.

e. The purpose of the detector is to remove the broadcast information from the IF signal carrier. The carrier is no longer needed since it has taken the broadcast information through the receiver, in an amplified form and has presented this information to the detector. After the detector has extracted the carrier from the information, the information is sent to the audio amplifier, automatic frequency control, and the automatic gain control.

f. The basic purpose of any receiver is to reproduce broadcast information in the audio range (15Hz to 20KHz) as received from the transmitting station. The audio amplifier amplifies or magnifies this information, after which the information may go through several stages of amplification to produce a large enough signal to be processed by a power amplifier. After the information has been through the power amplifier, it is then sent to the loudspeaker. The loudspeaker transforms the electrical signal information back to sound waves where it is easily heard and understood.

g. The Automatic Gain Control operates the same in FM receivers as it does in AM receivers.

h. The Automatic Frequency Control can determine or sense deviation from a set frequency; its job is to keep the receiver at the desired operations frequency.

2. AM and FM receiver similarities and differences. There are both similarities and differences between AM and FM receivers.

a. Comparing the input of both the AM and FM receivers shows they both have antennas, RF amplifiers, mixers and a local oscillator. These blocks may be called "tuned," and will select one broadcast station's composite-signal.

(1) The composite-signal consists of the carrier and the information. Amplify and mix the composite-signal with the local oscillator signal and it will introduce an IF signal to the IF amplifier. Here again, the composite-signal is amplified and sent to the detector.

(2) In the AM and the FM detector, the information is removed from the carrier, and sent to the amplifier and converted to sound by the loud-speaker.

b. AM and FM differences.

(1) One difference between the two radio functions are the frequencies received and the detection systems.

(2) Another difference is that the FM radio requires an AFC to stabilize the local oscillator, thereby keeping the desired broadcast station tuned in.

NOTE: Study and memorize the basic block diagrams of radios and of televisions. Look for blocks that are common to all systems. Understand the purpose and/or functions of the blocks. You will find by doing this study and memorization, troubleshooting and servicing this unit will be a lot easier.

Learning Event 4:

DESCRIBE AND IDENTIFY PHASE SHIFTING AND DISTORTION PROBLEMS IN STEREO SYSTEMS

1. Importance of alignment. Accurate and precise head alignment is very important in terms of a stereo tape deck.

a. Azimuth misalignment between the record and playback heads, or from a different skewing of the tape during the record and playback modes, will result in phase shifting between channels. Because of this shifting, compatibility and interchangeability are much harder to obtain for stereo tapes than for mono tapes.

b. Therefore, this type of distortion is more evident when reproduced on a monophonic receiver. Keep in mind that monophonic receivers basically reproduce the sum of the two channels. Any phase shifting between these two channels differs with frequency, resulting in partial cancellation and reinforcement over the gamut of frequencies being reproduced. The end result can have a disastrous effect on the quality of the reproduced sound. This also means the stereo transmission is no longer compatible with monophonic reproduction when such errors exist.

2. Precise adjustment. Precise azimuth adjusting is required for reel-to-reel and stereo tape recorders. Earlier cartridge stereo systems did not provide for a tape-guide height adjustment, and the arrangement of the tape path allowed considerable "creeping" up the guide posts. More recent tape cartridges provide adjustable guide height as well as head adjustment. Some even have an additional guide post installed prior to the original input guide for the tape entering its final path across the head for a more rigid and flutter free state with just standard tension.

3. Aligning stereo head. Using a fulltrack monophonic alignment tape is a good way to align a stereo head. This allows excellent alignment of the two-head stereo assembly which receives equal amplitude and identical phase from the two tracks at the reference frequency on tape.

Learning Event 5:

DESCRIBE AND IDENTIFY THE ELECTRONIC REQUIREMENTS OF RADIO RECEIVERS

1. Radio receivers. The Federal Communications Commission (FCC) has assigned all radio broadcast stations their operating frequencies. The amplitude modulated band (AM) is assigned 540KH to 1.6MH, and the frequency modulated band (FM) is assigned 88MH to 108MH.

2. Electronic requirements. Radio receivers must meet particular electronic requirements. Among these requirement are sensitivity, selectivity, and fidelity.

a. Sensitivity means how well the receiver picks up or receives the broadcast signal. The higher the sensitivity of the receiver, the better it will pick up (weak) broadcast signals.

b. Selectivity is the ability of the receiver to select or tune into one station and refuse all the rest. In low quality receivers, the selectivity is poor, resulting with the listener hearing more than one station at a time.

c. Lastly, fidelity is how well the receiver reproduces the signal being transmitted with little or no loss of the broadcast signal.

LESSON 4
PRACTICE EXERCISE

1. Which of the following statements best describes modulation?
 - a. Information
 - b. Combination
 - c. Multiplication
 - d. Regulation
2. Which of the following statements best describes the process of heterodyning?
 - a. The combining of two electrical signals
 - b. The separating of two electrical frequencies
 - c. The combining of three frequency patterns
 - d. The separating of three frequency combinations
3. What does the local oscillator produce?
 - a. A mechanical signal
 - b. A sound wave
 - c. An electronic signal
 - d. A sine wave
4. What type of an input signal is the audio amplifier designed to accept?
 - a. An electrical signal
 - b. An electromagnetic signal
 - c. An outgoing signal
 - d. Multiplication signal
5. Which of the following generates a turnable electronic signal?
 - a. Mixer
 - b. IF carrier
 - c. Power supply
 - d. Local oscillator
6. Which of the following keeps the receiver at a desired operating frequency?
 - a. Automatic gain control
 - b. Automatic frequency control
 - c. Local oscillator
 - d. Power supply

7. What causes phase shifting between channels in tape decks?
- a. Distorted information
 - b. Azimuth misalignment
 - c. Poor selectivity
 - d. Guide height
8. Which of the following is a good way to align a stereo head?
- a. Use the one-hand tape
 - b. Use the high DC voltage tape
 - c. Use a full track monophonic alignment tape
 - d. Use the low DC current tape
9. The FM band is assigned which of the following frequencies by the Federal Communication Commission?
- | | |
|-----------------|-----------------|
| a. 88KH - 108KH | c. 108KH - 88MH |
| b. 88M - 108MH | d. 88UH - 808UH |
10. Which of the following statements best describes selectivity?
- a. How well the receiver selects its input voltage
 - b. How well the receiver selects its listeners
 - c. How well the receiver selects a frequency over all others
 - d. How well the receiver selects its measuring devices

LESSON 5
DESCRIBE AND IDENTIFY COMPONENTS OF RECORDING SYSTEMS, AUDIO SPEAKERS,
CABLES AND CORDS, AND USES OF BASIC MEASURING EQUIPMENT

TASK

Describe and identify components of recording system, audio speakers, cable and cords, and uses of basic measuring equipment.

CONDITIONS

Given information and illustrations related to recording system components and audio speakers, cable and cords, and uses of basic measuring equipment.

STANDARD

Demonstrate competency of the task skills and knowledge by correctly responding to 80% of the multiple-choice test covering identification of components of recording system, audio speakers, cable and cords, and uses of basic measuring equipment.

REFERENCES

None

Learning Event 1:

DESCRIBE AND IDENTIFY THE COMPONENTS OF RECORDING SYSTEMS

1. Recording system components. Components of recording systems are divided into two basic parts, equalizers, and attenuators.

a. All reproducing and sound recording equipment have something in common, that is, the loss of high frequency response. An equalizer, or compensator, is a device consisting of reactive elements that may be connected into an electrical circuit for the purpose of altering the frequency characteristics of that circuit. More simply, equalizers compensate for frequency distortion in cables, lines or loads, in broadcast audio systems. The basic equalizer is the integrated or the differentiated circuit which you'll find at the receiving end of the cable to acquire low frequency or high frequency attenuation.

(1) Most cables impose a progressive attenuation of the higher audio frequencies; this is shown in Figure 5-1. Therefore, an equalizer is used which imposes a progressive attenuation of the lower audio frequencies.

(2) Although it is impossible to make the frequency response of this system uniform, a good deal of improvement could be acquired by selecting a suitable equalizer circuit with correct component values.

(3) A limitation of the equalizer is the inability to make up or compensate for load changes. Such changes may occur during switching procedures. Therefore, equalizers can be switched in or out of the Load circuit. Also, equalizers have a definite insertion loss, and this loss may be compensated by increasing amplitude. Figure 5-2 shows a typical equalizer configuration.

Figure 5-1. Cable, equalizer, and system frequency responses

Figure 5-2. Typical equalizer configuration

b. Attenuator. An attenuator is a network designed to reduce the amplitude of a signal. For this reason the circuit is usually passive rather than active. These circuits are beneficial for calibrating or other sensitive measurements.

(1) If the attenuator is well designed, then the amount of attenuation is continuous over the entire range of frequency in the system to be checked. Attenuators pose no reactance; therefore, no phase shift. These circuits are built to handle various input and output impedances; therefore, these impedances must be matched properly or the attenuator will function improperly. Figure 5-3 shows two different passive attenuators made of non-inductive resistors.

(2) Circuit A is called a pre-network attenuator.

(3) Circuit B is called a T-network attenuator. Both circuits function from the audio-frequency range to the VHF spectrum.

Figure 5-3. Attenuator. Attenuators often constructed from noninductive resistors. Here, two such devices are shown at A the pre-network and at B the T network. These attenuators are for use in unbalanced circuits

(4) However, from UHF and above the resistors begin showing inductive reactance. This happens because the wavelength is so short that the leads are quite long electrically; therefore, the attenuators no longer perform the function intended for them. Attenuators must be especially designed to suit the short wavelengths of the VHF's. These circuits must be physically small.

2. Attenuation. Attenuation is the decrease in amplitude of a signal between any two points in a circuit, usually expressed in decibels. Attenuation is the exact opposite of amplification and can be defined for power, current, or voltage. Occasionally attenuation in a particular circuit is sometimes expressed as a ratio.

a. As an example, the loss of signal in amplitude from say plus or minus 5 volts peak to plus or minus 1 volt peak is an attenuation factor of 5. This loss in decibels may be calculated using one of the following equations:

$$\begin{aligned} \text{ATTENUATION (db loss)} &= 10\text{Log}_{10} \times \frac{p_{in}}{p_{out}} && \text{"or"} \\ &20\text{Log}_{10} \times \frac{v_{in}}{v_{out}} && \text{"or"} \\ &10\text{Log}_{10} \times \frac{I_{in}}{I_{out}} \end{aligned}$$

b. Keep in mind that attenuation is the opposite of amplification. If the amplification factor is X db, then the attenuation factor is -X db.

3. Attenuation versus frequency characteristic. The attenuation versus frequency characteristic of a circuit is the amount of loss through the circuit as a function of frequency. The function is usually shown with the amplitude in decibels relative to a certain reference level on the vertical scale, and the frequency on the horizontal scale. Figure 5-4 illustrates the attenuation versus frequency characteristics curve for an audio low pass filter. This low pass filter was designed for use on an intelligibility enhancer for a voice-communications circuit.

a. Various devices are used for precise adjustments of the characteristics of attenuation versus frequency.

b. For instance, in high-fidelity recording equipment the equalizer is often used instead of the bass and treble controls to help obtain the desired audio response.

Figure 5-4. Attenuation. Attenuation versus frequency characteristics of a lowpass filter that might be used for communication purposes

Learning Event 2:

DESCRIBE AND IDENTIFY THE COMPONENTS AND FUNCTIONS OF A TYPICAL AUDIO SPEAKER

1. Speakers. Speakers transform energy from one form to another; i.e., electrical to mechanical energy. The speaker will convert the audio signal sent to it from the amplifier and change it into a instantaneous pumping motion. This motion (fig 5-5) is strong enough to transport air in vibrating patterns of waves that the ear hears as sound.

Figure 5-5. Speaker pumping action creates air vibrations we hear as sound

a. Drivers are the part of the speaker that actually move air. Drivers can be designed to get superior performance in the lower octaves (bass) or higher octaves (treble), usually not both. Most all speakers are basically AC electric motors functioning linearly instead of by rotation. Speakers have wire coils or another form of an electrical conductor hanging freely in the field of a permanent magnet.

(1) Electricity flows through the conductor and creates a magnetic field around the conductor with a strength equal to the amount of electricity moving through it.

(2) If the current changes directions, the north-south poles of the magnetic field reverses themselves with each current reversal. A permanent magnet's polarities remain constant.

(3) The law of magnetism states that opposite magnetic polarities attract, and like polarities repel each other. As a result, when alternating current in the form or configuration of an audio signal passes through the coil conductor, it interacts with the lines of force emanating from the permanent magnet. The conductor is alternately attracted and repelled, so forward and backward movement is created in accordance with the audio signal.

b. In most speakers the conductor is a wire coil and is attached to a cone that moves with it, pushing and pulling at the adjacent air surrounding it. Basically, you have just learned the classic operating principle of most speaker designs (fig 5-6).

Figure 5-6. Changing field of voice coil causes oscillating movement relative to constant field of magnetic structure creating sound

2. Impedance. Impedance is the resistance to the passage of alternating electrical current. In the past, high-fidelity components were not as standardized as they are today, thus, making the input impedance of a speaker and the output impedance of an amplifier fairly critical to ensure they match. Today, most equipment is rated uniformly at an average of 8 ohms. Eight ohms is said to be average because impedance varies with the frequency of audio signal.

a. Even though impedance matching is basically a minor problem nowadays, there are some speaker systems with other ratings, like 4 ohms. Low impedance-rated speakers may afford you some trouble when you hook them up with the average 8 ohm speakers.

b. Normally, two sets of speakers are connected in parallel. The pair of 8 ohm speakers connected in parallel presents a 4-ohm load to the amplifier. An 8-ohm speaker and a 4-ohm speaker present the amplifier with 3 ohm average impedance.

CAUTION: The output stage of a transistorized amplifier can burn out if presented with a too low of an impedance load.

3. Damping factor. Damping factor is the ratio of its own internal impedance to the impedance present to the amplifier by an external load. The damping factor will increase as the load impedance increases compared with the internal impedance. Transistorized amplifiers possess fairly high damping factors. This is useful because it helps to damp excessive speaker oscillation which gives you a much better response to transient signals and a cleaner sound.

Learning Event 3:

DESCRIBE AND IDENTIFY THE TYPES OF CABLES AND CORDS USED IN RADIO/TELEVISION STUDIOS AND USES OF BASIC MEASURING EQUIPMENT

1. Cables and Cords. A cable is any group of electrical conductors bound together. A cable may consist of only two conductors, such as the coaxial cable familiar to RF design; or it may be made up of several individual conductors protected with its own layer of insulation (fig 5-7). Cables are widely used in electronic and communications systems. As an example, many telephone networks are completed with the use of cables, and in faraway areas, cable is the only means of television reception with the exception of satellite transmission.

Figure 5-7. Two kinds of cable. At A, a coaxial cable with two concentric conductors. At B, a multi-conductor, unshielded cable

a. Coaxial cable is a two-conductor cable consisting of a single center wire surrounded by a tubular metal shield. Most metal shields are braided and insulated from the center conductor by polyethylene. Some coaxial cables have air dielectrics with the center conductor being insulated from the shield by polyethylene beads or spiral winding.

b. Coaxial cable is made in several diameters and characteristic-impedance values. A "hard line" cable is a low-loss, well-shielded coaxial cable, with an outer conductor of solid metal tubing.

c. Coaxial cable is easy to install; may be run next to metal objects, and installed underground without affecting the loss of performance. Many coaxial cables have greater loss per unit length than two conductor lines.

2. Radio-Television Cords. A cord is simple, durable cable, with two or three conductors, used to transfer electrical current to an appliance or device. The more familiar types of cords are the two and three conductors, 117 volts utility cords (fig 5-8).

Figure 5-8. At A a two-conductor cord. At B a common three-wire utility cord

a. Basically, cords are not appropriate for transferring alternating current above the audio frequency range. This is because of dielectric and conductor losses.

b. Only cables designed especially for radio frequencies should be used for such application.

3. Basic measuring equipment. A technician uses basic measuring devices, such as oscilloscopes or multimeters, to measure actual working values or signals in a radio or television set, as well as for analyzing problems.

a. Turn on device. The first thing you would do to start the repair process is turn the device on and watch, listen, and smell trouble or malfunctions. After the initial diagnosis of which block or blocks of the radio are malfunctioning, refer to the manufacturer's manual, Technical Manual or Field Manual for schematics of the equipment you are troubleshooting.

b. Read schematics. To assist you on the schematic diagram, both the operating voltage values and typical waveforms should be printed. Also included on the schematic diagrams are the test points to measure signals and exactly how the equipment is wired.

c. Use test equipment. As a technician you use test equipment to measure voltage, current, resistance, or signal waveforms, then compare these values to the values indicated on the schematic diagram. If some values do not agree with the manufacturer's manual, Field Manual or Technical Manual (schematics), then you have probably located the trouble in your equipment. This is the point of troubleshooting where your knowledge of the circuitry coupled with the information obtained by using the test equipment plays a specific part in locating the malfunctions.

LESSON 5
PRACTICE EXERCISE

1. Which of the following statements best describes a speaker?
 - a. Transforms equalization into attenuation
 - b. Transforms backward sound into forward sound
 - c. Transforms DC current into AC current
 - d. Transforms electrical energy to mechanical energy
2. Which of the following is a characteristic of a speaker driver?
 - a. Operates a vehicle
 - b. Moves air
 - c. Creates equality
 - d. Reverses current
3. What will happen with a transistorized amplifier if the output stage is presented with a very low impedance load?
 - a. Flash its help light
 - b. Burn out
 - c. Respond better to signals
 - d. Disconnect itself
4. Which statement best describes a hard line cable?
 - a. High loss
 - b. Low loss
 - c. Medium loss
 - d. Wide loss
5. What must you, as a technician, do to start the repair process?
 - a. Ask advice from a friend
 - b. Wait for supervisor to talk to the commander
 - c. Turn equipment on and watch, listen, and smell
 - d. Leave equipment where it is, someone else will repair it
6. What is the purpose of an attenuator?
 - a. To reduce the switches of two circuits
 - b. To reduce the driver of the circuit
 - c. To reduce the amplitude of a signal
 - d. To reduce the entire range of DC current

ANALYZING COLOR VIDEO AND VIDEO TEST SIGNALS

SUBCOURSE SS0606

US Army Signal Center and Fort Gordon
Fort Gordon, Georgia

EDITION 8
5 CREDIT HOURS
REVISED: 1988

General

The Analyzing Color Video and Video Test Signals subcourse requires a basic understanding of television electronics, television systems operation, and television transmissions. This subcourse is designed to teach you the knowledge and the basic applications used in color television transmission and television test signals. Information is provided on the fundamentals of color, color transmission, color test signals, and basic television test signals. The subcourse is presented in three lessons, each lesson corresponding to a terminal objective as indicated below.

Lesson 1: DESCRIBE THE FUNDAMENTALS OF COLOR

TASK: Describe the fundamentals of color used in television transmission.

CONDITIONS: Given the information and illustrations relating to the fundamentals of color.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test questions covering the fundamentals of color used in television transmission.

Lesson 2: DESCRIBE THE COLOR BAR TEST SIGNALS

TASK: Describe and identify the four basic color bar test signals.

CONDITIONS: Given information and illustrations relating to the four basic color bar test signals.

STANDARDS: Demonstrate competency of task skills and knowledge required for identification of the color bars signals discussed in this lesson by correctly responding to 80 percent of the multiple-choice test questions covering the four basic color bar test signals.

Lesson 3: DESCRIBE THE BASIC ELECTRONIC TELEVISION TEST SIGNALS

TASK: Describe and identify five basic electronic television test signals.

CONDITIONS: Given information and illustrations pertaining to the basic television test signals.

STANDARDS: Demonstrate competency of task skills and knowledge required for identification of the test signals discussed in this lesson, by correctly responding to 80 percent of the multiple-choice test questions covering five basic electronic television test signals.

This subcourse is designed to provide the reader a good understanding of the fundamentals of color video and the basic applications of video test signals. It is not designed to instruct on equipment repair.

This subcourse supports the following MOS 26T tasks:
STP 11-26T13-SM-TG, September 1985

113-575-0021	Troubleshoot and Repair a Television Receiver
113-575-0038	Troubleshoot and Repair Video Pulse Distribution Amplifiers
113-575-0043	Troubleshoot a Color Television Camera
113-575-0044	Troubleshoot a 3/4-inch Video Cassette Recorder/Reproducer
113-575-0045	Troubleshoot a Television Transmitter
113-575-0046	Troubleshoot a Television Video Switcher
113-575-0049	Troubleshoot a Time Base Corrector
113-575-2040	Perform Functional Check of a Color Television Film Camera Chain
113-575-2041	Perform Functional Check of a Color Television Camera System

113-575-2042	Perform Functional Check of a Color Television Studio Camera Colorplexer
113-575-2043	Perform Functional Check of a Color Television Studio Camera
113-575-2045	Perform Functional Check of a Time Base Corrector
113-575-2047	Perform Functional Check of a Television Transmitter
113-575-3033	Perform Measurement of the Visual and Audio Transmitter Carrier Frequency
113-575-3035	Perform Daily Maintenance of a Television Switcher
113-575-8017	Perform Alignment Check of a Waveform Monitor

INTRODUCTION TO ANALYZING COLOR VIDEO AND VIDEO TEST SIGNALS

The Federal Communication Commission (FCC) standards for broadcast television are based on the work of the National Television System Committee (NTSC). The term "NTSC Color" is often used because the specific details of the television transmission system were designed and developed by NTSC. NTSC sets the standards which are used in the United States and in the various countries that use this system.

Once the guidelines were established for black and white and color television transmission, test equipment had to be designed to maintain the specifications of the signal being transmitted. The NTSC joined in collaboration with the Electronics Industries Association (EIA), the Society of Motion Picture and Television Engineers, and the Institute of Electrical and Electronic Engineers (IEEE) to develop various television test signals.

This subcourse explains the fundamentals behind the development of the color signal and how it is transmitted. The subcourse identifies and discusses various applications of the television test signals such as: Color bars, Multiburst, Gray-scale Linearity, Vertical Interval Test, Vertical Interval Reference, and Sin2 Window test signals. The information contained in this subcourse will provide knowledge necessary to enhance your competence in the field of television engineering.

Lesson 1
DESCRIBE FUNDAMENTALS OF COLOR

TASK

Describe the fundamentals of color used in television transmission.

CONDITIONS

Given the information and illustrations relating to the fundamentals of color.

STANDARD

Demonstrate competency of the task skills and knowledge by correctly responding to at least 80 percent of the multiple-choice test covering the fundamentals of color used in television transmission.

Learning Event 1:
DESCRIBE COLORIMETRY

1. General. To learn the color TV system you must have a basic background in the fundamentals of color. The entire concept of color television is based upon how the eyes react to light frequencies. From studies conducted on how people see, it was determined that the color signals would occupy a certain amount of space in the frequency bandwidth for color television. The process of specifying and determining colors had to be accomplished before the color television system could be developed. This is a science in itself and is known as colorimetry.

2. Colorimetry. The science and practice of determining and specifying colors is referred to as colorimetry. The science of colorimetry was especially important to the color engineers who contributed to the design of the present color television system. Since the system had to be designed to reproduce things as they are seen in nature, the characteristics of light, vision, and color were taken into consideration.

a. Colorimetry is a very complex subject. It is not necessary to be an expert colorimetrist in order to understand the takeup of the color picture signal and the way in which it is used in the color receiver. However, a better understanding of

the color television system is attained if the most important fundamentals of colorimetry are known. The principles of color as applied to television are slightly different from those which many of us have been taught in connection with other types of color reproduction.

b. The properties of light and vision must be understood before studying the principals of color. Light is the basis of color and the eye must be able to convey picture sensation to the brain. But the eye has certain visual limits.

3. Limits of vision. The limits of vision are chiefly determined by four factors; intensity threshold, contrast, visual angle, and time threshold.

a. Intensity threshold. This is the lowest brightness level that can stimulate the eye. It is very much dependent upon the recent exposure of the eye to light. When a person enters a darkened room it takes the eye a long time to reach maximum sensitivity. The required time, which is usually about an hour, differs among individuals. When a person returns to a lighted area the time it takes for the eye to reach maximum is very short, actually just a matter of minutes.

b. Contrast. This represents a difference in the degree of brightness and in the intensity between black and white elements of the reproduced picture. The range of contrast should be great to produce a strong picture, with bright white and dark black for the extreme intensity values.

c. Visual angle. As an object is made smaller or is placed further from the eye, the angle formed by the light rays from the extremities of the object to the eye becomes smaller. This angle is referred to as the visual angle. In order for the eye to respond, the visual angle must be such that the image covers a definite area on the retina. If this area is decreased, a point at which the eye could no longer see the object is reached. This principle is used in eye tests. The minimum visual angle is dependent upon the contrast and brightness of the image. For example, an object with sharp contrast can be distinguished at a narrow visual angle, while the same size object with a lower contrast might not be visible.

d. Time threshold. There is a minimum time during which a stimulus must act in order to be effective. This is called the time threshold. If the exposure interval is too short, the rods and cones of the eye do not have time to respond to the image on the retina. The time threshold is also dependent upon the size, brightness, and color of the object. These four factors are all important factors that were taken into consideration in development of the color system for television. Now, light sources must be discussed.

4. Light Sources. To see, we must have a source of light, just as in the process of hearing we must have a source of sound before we can hear. When we speak of light, we usually think of light coming from the sun or the light which is emitted from some artificial lighting source such as electrical light. This type of light is referred to as direct light. Another type of light is indirect or reflected light, given off by an object when direct light strikes it. Direct light falling on an object is either absorbed or reflected. If all the light is reflected, the object appears white. If direct light is entirely absorbed, the object appears black. The larger the amount of light that is reflected by an object, the brighter the object will appear to the eye. In addition, the brighter the light source, the brighter the object will become. This can be demonstrated by casting a shadow on a portion of an object and noting the difference in brightness of the two areas. The portion without the shadow will appear brighter.

5. The visible light spectrum. Light is one of many forms of radiant energy. Any energy that travels by wave motion is considered radiant energy. Classified in this group along with light are sound waves, X-rays, and radio waves. As shown in Figure 1-1, light which is useful to the eye occupies only a small portion of the radiant energy spectrum. Sound is located at the lower end of the spectrum; cosmic rays are at the upper end. Light falls just beyond the middle of the spectrum. Along the top of the spectrum is the frequency scale, and along the bottom is the Angstrom unit scale (fig 1-1).

Figure 1-1. Radiant energy spectrum

a. Wavelengths in the region of light are measured in millimicrons. These units are also shown along the bottom of the spectrum in the illustration. Visible light is made up of that portion of the spectrum between 380 and 780 nanometers (fig 1-2). The usable portion of the light spectrum for television falls between 400 and 700 nanometers (fig 1-3).

Figure 1-2. Visible light spectrum

Figure 1-3. Visible light spectrum used for color television

b. When all of the light spectrum from 400 to 700 nanometers is presented to the eye in nearly equal proportions, white light is seen. This white light is made up of various wavelengths which represent different colors. Passing light through a prism will show the composition of the visible light spectrum, (fig 1-4). The light spectrum is broken up into various wavelengths, with each wavelength representing a different color. The ability to disperse the light with a prism results because light with shorter wavelengths travels slower through glass than does light of longer wavelengths. Six distinct colors are visible when passing white light through a prism. Since the colors of the spectrum pass gradually from one to the other, the theoretical number of colors becomes infinite. It has been determined that about 125 colors can be identified in the visible spectrum.

Figure 1-4. Effect of prism on white light

Learning Event 2:

DESCRIBE LUMINOSITY AND THE ADDITIVE METHOD OF COLOR MIXING

1. Luminosity curve. The fact that the human eyes do not perceive each color with equal efficiency is due in some way to the physical construction of the eye. It is believed that the cones of the retina respond to color stimuli and that each cone is terminated by three receptors. Each receptor is believed to respond to a different portion of the spectrum, with peaks occurring in the red, blue, and green regions. An average can be taken of the color response of a number of people, and a standard for the average person can be derived.

a. This standard response is called the luminosity curve for the standard observer (fig 1-5).

Figure 1-5. Luminosity curve

b. The curve is a plot of the response verse wavelength. We can look at the luminosity curve and see that maximum response

occurs at a wavelength of approximately 555 nanometers and that less response is indicated on either side of that point. From this information, it can be seen that the average person's eye is most sensitive to yellow-green light.

2. Qualities of color. There are three qualities which are used to describe any one color. These are hue, saturation, and brightness.

a. Hue is a quality which is used to identify any color under consideration, such as red, blue, or yellow. Hue, which defines the wavelength of the color, would be synonymous with frequency, which defines the wavelength of the radio wave.

b. Saturation is a measure of the absence of dilution by white light and can be expressed with terms such as rich, vivid, or pure. Saturation defines the purity of the color, and is synonymous with signal to noise ratio, which defines the purity of the radio wave. A 100-percent saturated color contains no white light.

c. Brightness defines the amount of light energy which is contained within a given color. It is synonymous with amplitude, which defines the amount of energy in the radio wave. Brightness is a characteristic of both white light and color. Hue and saturation are characteristics of color only. The brightness level of a color can be changed without changing the saturation. The converse is also true.

3. Any given color, within limitations, can be reproduced or matched by mixing three primary colors. This applies to large areas of color only. Color vision for small objects or small areas is much simpler because only two primary colors are needed to produce any hue. This is because, as the color area is reduced in size, it become more difficult to differentiate between hues. For small areas every hue appears as gray. At this point a change in hue is not apparent; only a change in brightness level can be seen. For example, a large area of blue can be easily distinguished from a large area of blue-green. However, when these areas are reduced in size, it becomes more difficult to distinguish between the colors.

4. Color mixing. In color television, the additive process of color mixing is used. It uses colored lights for the production of colors. The colors in the additive process do not depend upon an incident light source; self-luminous properties are characteristics of additive colors. Cathode ray tubes contain self-luminance properties, so it is logical that the additive process would be employed in color television.

a. The three primaries for the additive process of color mixing are red, blue, and green. Two requirements for the primary colors are that each primary be different and that the combination of any two primaries do not produce the third. Red, green, and blue were chosen for the additive primaries because

they fulfilled these requirements, and the greatest number of colors could be matched by the combination of these three colors. Three additive primaries are combined in a definite proportion (fig 1-6). White has been produced through the addition of all three primaries. Red and green combine to make yellow. The combination of red and blue produces magenta (bluish-red), while blue and green combine to make cyan (greenish-blue).

b. Yellow, magenta, and cyan are the secondary colors and are the complements of blue, green, and red, respectively. When a secondary color is combined with its complementary primary, white is produced. For example, combining yellow with blue produces white. Cyan added to red produces white and magenta plus green produces white. Carrying this one step further, the complementary colors when added together produce white. The expression circles in Figure 1-6 relate to color mixing.

Figure 1-6. The expression circles of color mixing

c. Since yellow + blue = white, and red + green = yellow, then red + green + blue = white. Because the addition of the three primaries can produce white, the addition of the correct proportions of the three complementaries which are made up of the three primaries can also produce white. Therefore cyan + magenta + yellow = white.

d. It is not necessary to overlap the primary colors in the additive process to produce a different color. Two sources of color may be placed near each color, and at a certain viewing distance the two colors will blend and produce the new color. The eye actually performs the additive process. The screen of a color kinescope contains hundreds of thousands of phosphorous dots arranged in triangular patterns (fig 1-7). Each dot is excited by its own electron beam. The cluster of dots will emit a white light or any other color depending on the strength of the various electron beams. Due to the limits of vision of the human eyes and the process discussed above, we are actually seeing an illusion when we watch our television receiver.

Figure 1-7. Phosphorous dots

e. Each additional primary color contributes a certain percentage of brightness in the mixture of white. Green is the brightest of the three primaries, red is the second brightest, and blue is the dimmest. This has been determined through experimentation with the response of the eye. The eye responds more to green than any other of the primary colors. With the total brightness of white considered as unity, green contributes 59 percent of the total, red 30 percent, and blue 11 percent. Therefore, when combining green with red we have yellow with a brightness level of 89 percent. Cyan has a brightness value of 70 percent. The third complementary color, magenta, has a brightness value of 41 percent. It obtains 30 percent from red and 11 percent from blue. The order of brightness for each color is known as the luminance staircase (fig 1-8).

Figure 1-8. Luminance staircase

5. The Commission Internationale de l'Eclairage (CIE) chromaticity diagram and the NTSC triangle. In the development of a color matching and specification system, extensive color matching tests on many observers were conducted using a device known as a colorimeter. In order to establish an average which could be considered as that of the standard observer, many persons were used, with each performing similar tests. The results of these tests are known as tristimulus values for the color mixture curves.

a. By the use of mathematical equations, the information contained in the color mixture curves has been converted to a graphical representation of the color on a three-dimensional plane and is referred to as the Maxwell Triangle. For practical purposes the three-dimensional Maxwell triangle has been converted to a two-dimensional drawing and designated as the CIE chromaticity diagram.

(1) Examining the diagram in Figure 1-9, you see that the horseshoe curve, which is known as the spectrum locus, is graduated into numerals ranging from 400 in the left-hand corner to 700 at the extreme right. These figures represent the wavelengths of the various colors in nanometers. The blues extend from approximately 400 to 490 nanometers, the greens from approximately 550 to 580 nanometers, and the reds (including orange) extend from 580 to 700 nanometers.

(2) Since fully saturated colors contain no white light, the spectrum colors which lie directly on the horseshoe curve are 100-percent saturated. At point E in Figure 1-9, only white light is present, so there is zero percent saturation. This same principle applies when observing the vectorscope, which is a device used for measuring relationships between the various color signals being transmitted as well as the amount of saturation present.

(a) Various percentages of saturation fall along a straight line drawn between any point on the spectrum locus and point E (fig 1-9). As you move towards point E, the saturation is decreased.

(b) Conversely, as you move toward the curve, the saturation is increased. Thus, you can see that a 100-percent saturated color is one that has 100-percent purity or freedom from white and that a desaturated color is a color which contains some amount of white light.

b. When primary colors were selected for color television work, it was found that those primaries were limited by color phosphors that were available for the picture tube. Figure 1-9 shows the actual location of the primaries (red, blue and green) that are used in color television. These points represent the primaries selected by the NTSC, and define a triangle within the boundaries of the chromaticity diagram.

(1) NTSC is a research group set up by leading equipment manufacturers and broadcasters. The group examines all aspects of television, such as frequency, bandwidth, quality, power, color, and methods of transmission.

(2) The area within the triangle represents the range of colors that are obtainable when these primaries are used. In the NTSC triangle, red has a wavelength of approximately 610 nanometers, green is approximately 540 nanometers, and blue is approximately 470 nanometers. At first glance, this triangle appears much smaller than the spectrum of colors obtainable when ideal primaries are used. But, if you give Figure 1-9 a close inspection, you see that the NTSC primaries fall very close to saturated colors on the chromaticity curve. The red primary, for example, is actually on the curve.

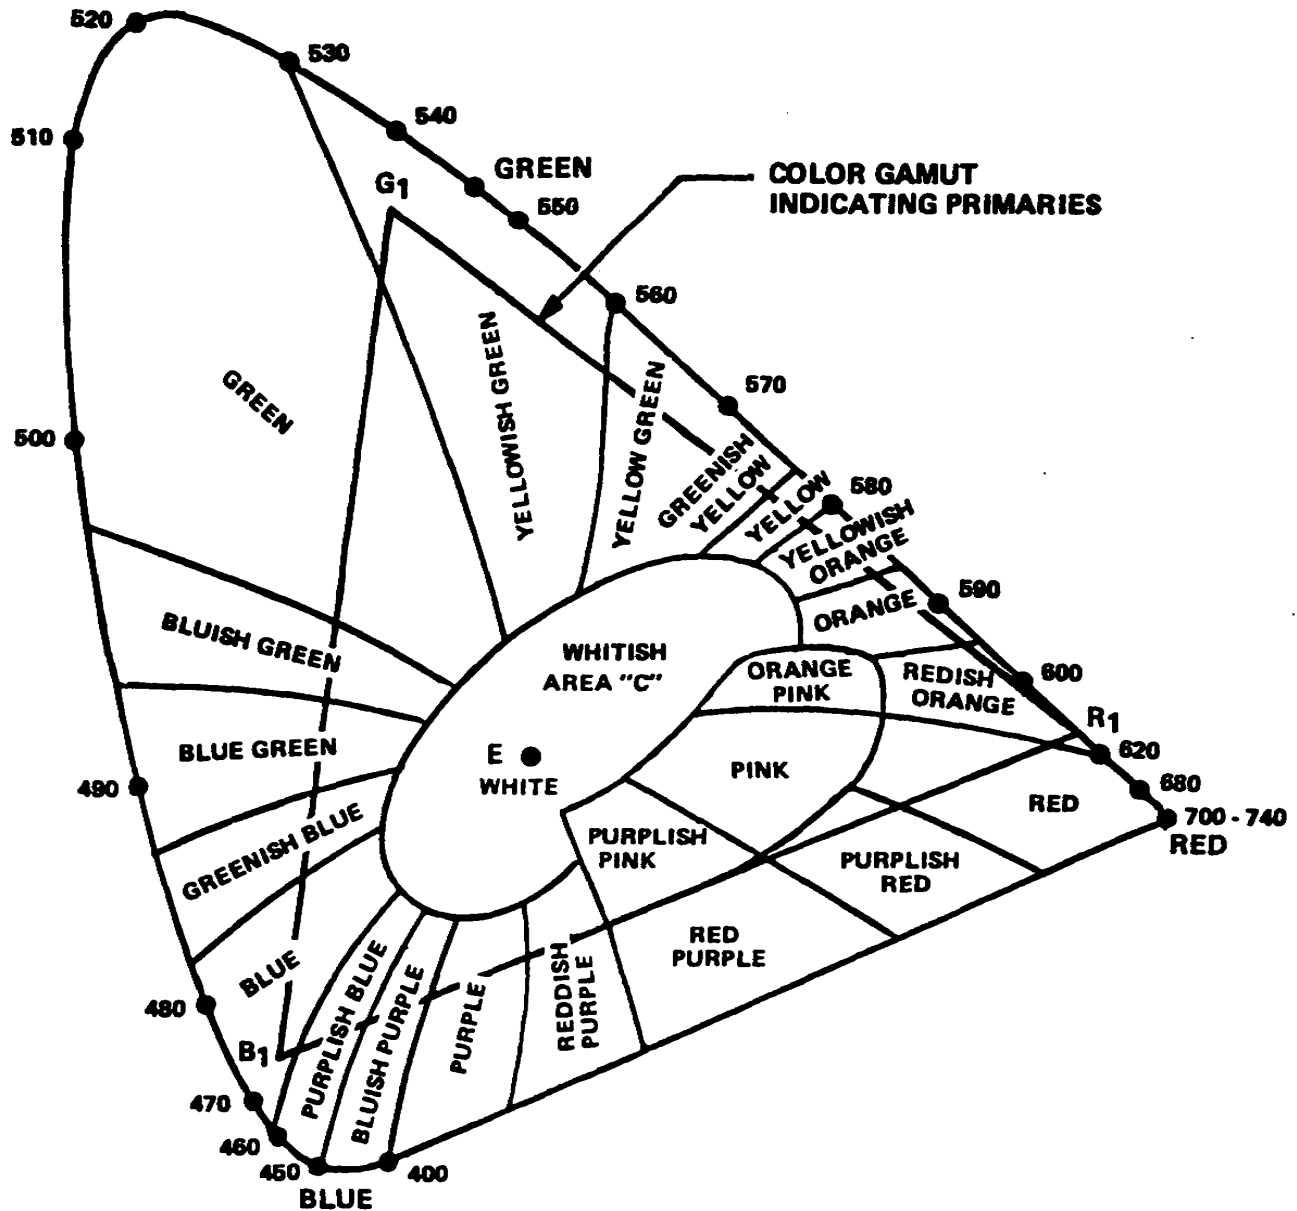

Figure 1-9. CIR chromaticity diagram and the NTSC triangle

Learning Event 3:
DESCRIBE THE NTSC COLOR TRANSMISSION SYSTEM

1. Compatibility is one of the primary requirements of the color television system. Compatibility provides a high definition black and white picture for present standard black and white receivers without any modifications to the TV receiver. This means that the following must apply:

a. First, a color telecast must provide a full 6-MHz black and white signal with the same amplitude modulation, sync, and blanking characteristics as does any ordinary standard monochrome telecast.

b. Second, the chrominance information, which includes the hue and saturation variable of color, must be transmitted within the standard 6-MHz television channel.

c. Third, the transmitted chrominance information must not in any way cause objectionable interference with the black and white signal (the brightness variable of color).

d. At first glance it seems to be a difficult task since the 6-MHz channel is apparently already well filled. However, you will learn that it is not impossible to transmit the chrominance information along with the monochrome signal within the standard 6-MHz television channel.

2. As previously stated, color television programs must be transmitted so they can be faithfully reproduced by black and white receivers. This feature is known as compatibility (fig 1-10).

Figure 1-10. Compatibility

3. Reverse compatibility (fig 1-11) or black and white reception on a color receiver is the next requirement. A black and white signal' transmitted by a monochrome system is split three ways and is applied to the red, blue and green electron gun cathodes of a tricolor kinescope. Before the signal is applied to its electron guns, the tricolor tube is adjusted to produce a white raster. After a white raster is obtained, the signal is applied to all three guns and the black and white signal being transmitted produces a monochrome picture on the tricolor kinescope. In the process of producing a white screen, the kinescope automatically separates the brightness signal into a ratio of 30 percent red, 11 percent blue, and 59 percent green as the signal is applied to the electron guns.

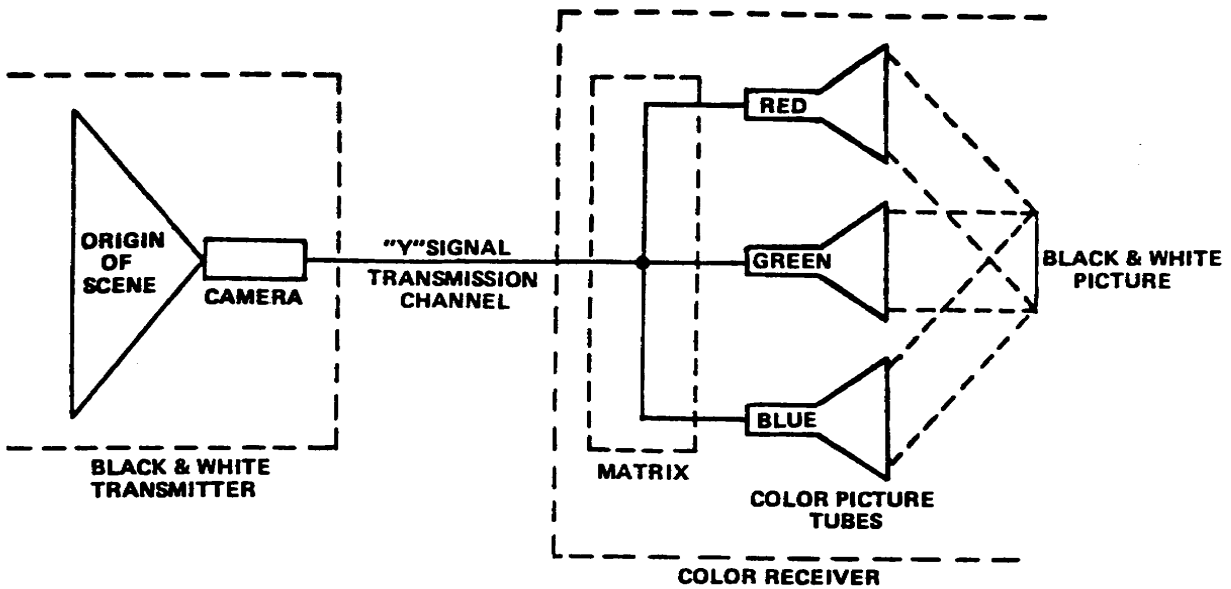

Figure 1-11. Reverse compatibility

4. A review of the standard bandwidth breakdown of a TV channel is presented in figure 1-12, so you can associate it with the bandwidth of the color signal. The bandwidth is 6 MHz, the video carrier is placed 1.25 MHz above the vestigial sideband, video information is compressed within the 4.2 MHz band above the video carrier, and for compatibility the monochrome and chrominance information is placed within the same 4.2 MHz band (fig 1-12).

Figure 1-12. Standard television bandwidth

a. The color information is contained within the same 4.2 MHz band as the monochrome signal. It was discovered that a monochrome 4 MHz video signal does not occupy every cycle of the 4 MHz assigned to it. Rather, this signal appears in forms of clusters or "bursts" of energy located in harmonics of the 15750 Hz line-scanning frequency.

b. Figure 1-13 indicates that in a TV scene, the electrical signal consists of bursts of signal energy at the line harmonics with harmonics of 30 Hz (frame rate) and 60 Hz (field rate) clustered on either side. Other frequencies are attenuated so much that the space in between is considered to be unoccupied by any electrical signal. From Figure 1-13 it can be seen that half of the video spectrum is unused. Since the scanning rate for the chrominance and for the luminance signals are the same, the concentrations of energy produced by both are spaced at the same intervals. It is feasible, therefore, that the bands of concentrated energy of the chrominance signal could be spaced between the bands of the luminance signal. As seen in Figure 1-13, the spaces in the frequency occur at odd multiples of one-half the line frequency.

Figure 1-13. Distribution of energy in the frequency spectrum of a standard monochrome signal

c. If a subcarrier frequency equal to an odd multiple of one-half the line scanning frequency is chosen, the chrominance and luminance signals are interleaved. This practice is followed today (fig 1-14).

5. Color signal components. A color signal consists of two components; a monochrome signal and the signal which carries information concerning color. Each component will be examined separately.

Figure 1-14. Interleaving of color with luminance signals

a. The monochrome signal (luminance or black and white), portion of the total color signal is equivalent in all respects to the present monochrome signals. It is formed by combining the red, blue and green signals from their respective color camera pickup tubes in these proportions:

$$Y \text{ (luminance)} = 0.59G + 0.30R + 0.11B$$

Where:

Y = a mathematical symbol representing the luminance signal

G = green signal

R = red signal

B = blue signal

(1) This particular proportion was chosen because it closely follows the color sensitivity of the human eye. That is, if you take equal amounts of red, blue, and green light and superimpose the rays from these lights on a screen, you will see white. However, if you then look at each light separately, the green will appear twice as bright as the red, and from 6 to 10 times as bright as the blue. This is because the eye is more sensitive to green than to red and more sensitive to red than to blue.

(2) Thus, the luminance signal is composed of 59 percent green signal (that is, 59 percent of the output of the green camera pickup tube), 30 percent red, and 11 percent blue, and contains frequencies from 0 to 4.2 MHz.

(3) The terms monochrome and luminance are synonymous. They are also often referred to as the brightness signal. Every monochrome signal contains nothing but the variations in amplitude of the picture signal, and these amplitude variations at the picture tube produce changes in light intensity at the screen.

b. The second component of the television signal is the color signal itself, which is interleaved with the black and white signal. To determine what information this portion of the total signal must carry, we will examine how the eye reacts to color, since it is in the eye where the color image is formed. The color-discerning characteristics of the human eye have been thoroughly studied and, briefly, here is what is known:

(1) The typical human eye sees a full color range only when the area or object is relatively large. When the size of the area or object decreases, it becomes more difficult for the eye to distinguish colors. Thus, where the eye required three primary colors, now it finds that it can get along very well with only two. That is, these two colors will, in different combinations, provide the limited range of colors that the eye needs or can see in these medium-sized areas.

(2) When the detail become very small, all that the eye needs to (or can) discern are changes in brightness. Colors cannot be distinguished from gray, and in effect the eye is color blind.

(3) These properties of the eyes are put to use in the NTSC color system. First, only the large- and medium-sized areas are colored; the fine detail is fendered in black and white. Second, even the color information is regulated according to bandwidth; that is, the larger objects receive more of the green, red, and blue than the medium sized objects.

(4) The color signal takes the form of a subcarrier and an associated set of sidebands. The subcarrier frequency is 3.579545 MHz or rounded off to 3.58 MHz. This represents a figure which is the product of 7875 Hz multiplied by 455. The value 7875 Hz is one-half the line frequency of 15750 Hz, and if we use an odd multiple of 7875 Hz as a carrier, the frequency falls midway between the harmonics of 15750 Hz. If we use even multiples of 7875, we would end up with 15750 Hz or one of its harmonics, and this would place the color signal at the same points throughout the band as those occupied by the black and white signal (fig 1-14). By taking an odd multiple of 7875 Hz, we cause the signal to fall in between the bundles of energy produced by the first signal, and the two do not interfere.

(a) It is highly desirable to have the color subcarrier frequency as high above the picture carrier as possible in order to minimize the interference with the black and white video information (fig 1-15).

Figure 1-15. Black and white video energy distribution

(b) The energy level of the black and white video falls very rapidly with increasing video frequencies. By placing the color subcarrier as high as possible the different energy levels minimize possible interference (fig 1-16). Practical limits set the upper limit to 3.6 MHz.

Figure 1-16. Placement of the color subcarrier

(5) There is a very objectionable 0.92 MHz (920 kHz) signal generated from the beat between the sound carrier and the color subcarrier ($4.5 \text{ MHz} - 3.58 \text{ MHz} = 0.92 \text{ MHz}$). The beat is much less objectionable if the sound-carrier frequency is a multiple of the horizontal scan frequency away from the video carrier frequency. In standard black and white TV, the 286th harmonic of the horizontal line rate, 15750 Hz is 4.5045 MHz. The line frequency whose 286th harmonic is 4.5 MHz is 15734.26 Hz. $F (\text{line}) = 4.5 \text{ MHz} / 286 = 15734.26$ (new line frequency for color).

(a) This frequency is within the deviation limit set by the NTSC monochrome standards. With the horizontal scan frequency changed, the color subcarrier must be chosen to interleave. It must be an odd multiple of one-half the horizontal scan rate. With 3.6 MHz as an upper limit, it was found that the 455th harmonic of half the horizontal scan rate becomes:

$$F (\text{color subcarrier}) = 455 \times 15734.26 \text{ Hz} / 2 = 3.58 \text{ MHz}.$$

Since there are 525 lines, and using a 2:1 interlace, the new vertical scan frequency becomes:

$$F (\text{vertical}) = 2 / 525 \times 15734.26 \text{ Hz} / 1 = 59.94 \text{ Hz}.$$

(b) Notice that the new scanning frequencies used for color transmission are slightly below the nominal values used in monochrome receivers. However, the changes amount to less than the 1 percent tolerance allowed, and the new frequencies fulfill the requirements for compatibility in monochrome reception.

6. Tolerance of subcarrier frequency. To maintain close synchronization of the color receivers, the tolerance for the subcarrier frequency is set at ± 0.0003 percent, or around ± 10 Hz; and the rate of change cannot be more than 1/10th Hz per second. The same tolerance applies to the field and line frequencies. In actual practice, all of these frequencies are developed from the same source to minimize variations from established figures.

7. Chrominance sideband transmission. Since picture detail is a function of the transmitted signal bandwidth, and since there is a limited amount of bandwidth allowed for chrominance information, this is an important point to consider. The highest usable video brightness signal frequency is 4.1 MHz, with the chrominance subcarrier at 3.58 MHz (fig 1-17). Transmitting symmetrical or double sidebands of chrominance would mean that color definition would be limited to 0.5 MHz and color would be absent in all fine detail in the picture. It is possible however, to transmit the chrominance sideband vestigially: that is, with one side band suppressed, the same as the black and white signal.

Although this would extend the color definition to possibly 1.5 MHz, it is practical to transmit only one of the chrominance signals vestigially. One of the color difference signals would then extend from 0 to 1.5 MHz, while the other color difference would be limited from 0 to 0.5 MHz.

Figure 1-17. R-Y and B-Y chromaticity coordinates

8. Color difference signals. The color difference signals are the signals which can be produced by subtracting the Y signal from each color camera signal. For example, the Y signal is inverted so that all values are negative (-30R, -59G, -11B). This is algebraically added to each camera tube output in turn, producing three chrominance signals, R-Y, G-Y, and B-Y. Only two color difference signals plus the Y signal need to be transmitted to reproduce the color elements of any televised scene. One of the color difference signals may be developed in the receiver, since any two color difference signals contain all the necessary color information. Thus, only the R-Y and the B-Y signals need to be transmitted.

a. It should be noted that if R-Y were the extended sideband, fine detail would appear as either a bluish-red (magenta) or a bluish-green (cyan). On the other hand, if B-Y were the extended sideband, only reddish-green or yellow-green colors would be produced (fig 1-17).

b. Fine color detail is represented accurately to the eye by orange or cyan for any color. If this principle were to be used by R-Y and B-Y transmission standards, it would still be necessary to transmit extended sidebands of both color difference signals, since both are necessary to reproduce either cyan or orange.

(1) It appears then, that color definitions using the color difference signals must be limited to 0.5 MHz of sidebands extension (upper), and therefore cannot, by their inherent colors, represent full fidelity of the televised scene. The eye cannot detect all colors accurately for all sizes of picture detail. Color areas beyond a certain fineness of detail can be accurately represented to the eye by either orange or cyan, since the eye cannot distinguish any color other than one of these. For extreme fineness of detail the eye cannot detect any color sensation. Only a brightness variable is necessary to represent the object as having color.

(2) If the axis of the color subcarrier signals were shifted in phase from the reference subcarrier so that one axis would represent orange and cyan, with the other axis at right angles to it, then many transmission problems would be solved. The orange-cyan axis could be extended to 1.5 MHz, and since the fine detail conveyed by this extended bandwidth need only be either orange or cyan to represent accurate color reproduction to the eye, full color fidelity would be possible in picture detail up to 1.5 MHz of picture definition.

(3) By readjusting the phase of the chrominance signals and transmitting one signal vestigially with extended bandwidth, all colors are reproduced in picture detail from 0 to 0.5 MHz. Beyond this point, one of the chrominance signals drops out. With the orange-cyan signal still present to 1.5 MHz, effectively the eye still sees all color though only orange and cyan are transmitted. The eye cannot distinguish color in picture detail represented by video frequencies beyond 1.5 MHz. With no chrominance signals transmitted beyond this point, the brightness signal will accurately convey the illusion of color in video detail from 1.5 to 4.1 MHz.

9. High definition color transmission. The readjustment of chrominance signal phases is called high definition color transmission and is the system of color transmission used today. Since the chrominance axes in this system are not the same as R-Y and B-Y, they have been given new titles. One is called the "I" signal since it is nearest in phase to the burst or the reference subcarrier, and the other is called the "Q" signal as it is in quadrature with the I signal.

a. Figure 1-18 is a vector diagram of the I and Q color coordinates and their relationship to the old R-Y/B-Y system. The I and Q signals are produced with their phase coordinates 90 degrees from each other. The +I signal is 57 degrees from the reference subcarrier, with -I at 237 degrees (180 degrees from +I). The +Q signal is displaced 57 degrees + 90 degrees, or 147 degrees from reference subcarrier, with the -Q signal 180 degrees from it, or 327 degrees from the reference subcarrier.

Figure 1-18. Vector diagram

b. Color transmission begins at the camera where the light of the original scene is separated into three primary colors; red, blue, and green.

(1) Three individual signals or electrical elements are provided by means of three pickup tubes to represent the information of the three primary colors. The three electrical signals representing red, green, and blue hues of the televised scene are then routed to a device known as a colorplexer (also known as an encoder). Colorplexers are sometimes referred to as the heart of the television system. This unit combines the various individual signals originating at the camera into a composite color television signal. Figure 1-19 illustrates a typical colorplexer. One can see that the red, blue, and green signals from the camera enter the colorplexer and are fed to the matrix selection.

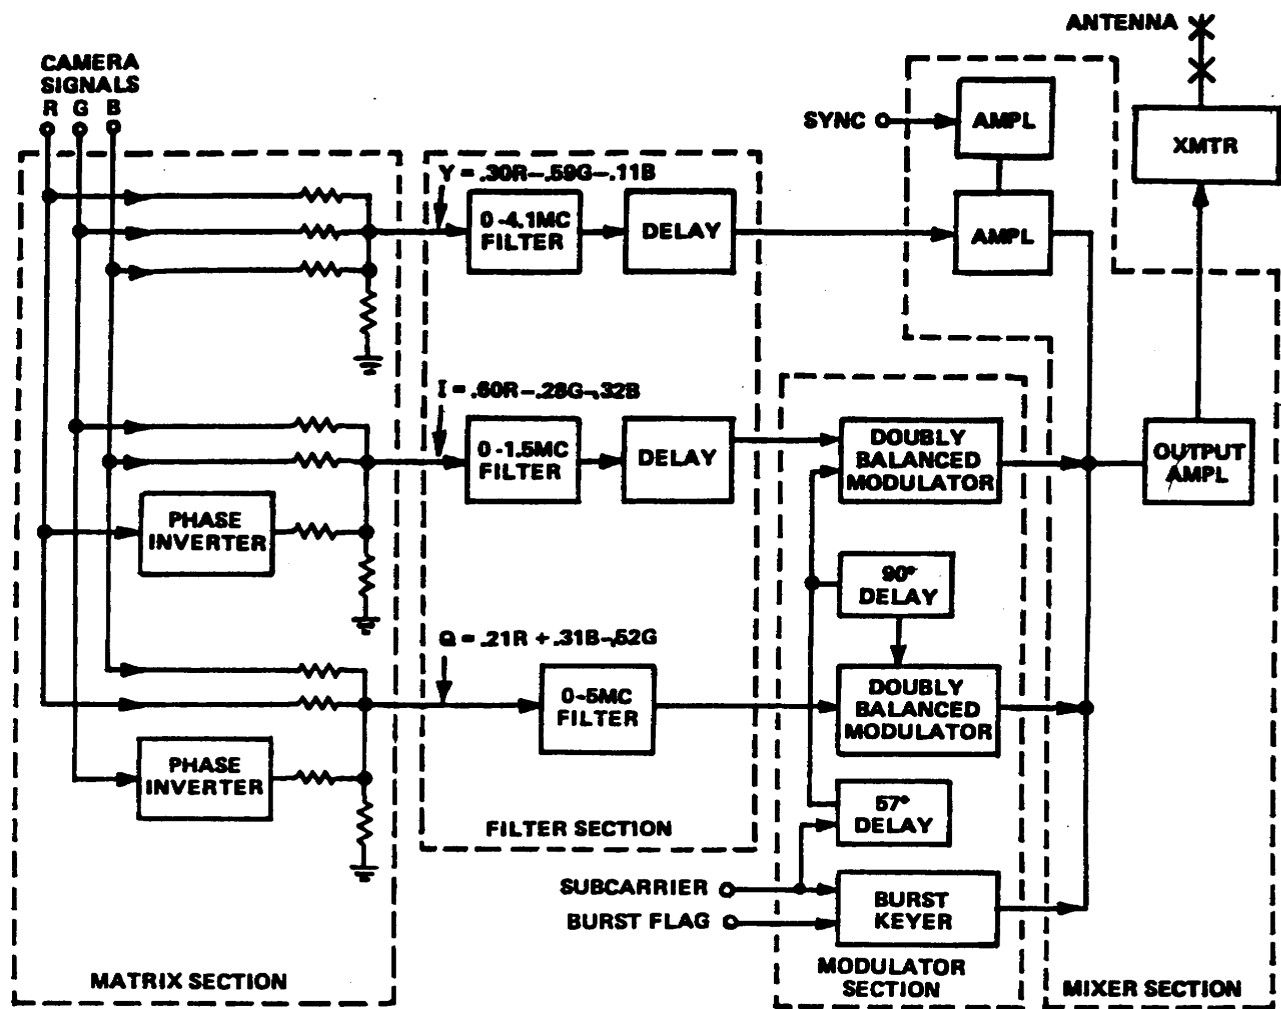

Figure 1-19. Basic colorplexer simplified block diagram

(2) Matrixing is the process of repackaging the information contained in the red, blue, and green output signals from the color camera. The outputs of the matrix are the Y, the I, and Q signals. The I and Q signals were previously known as the R-Y and B-Y signals. The Y signal is formed by applying the red, blue, and green pickup tube outputs to the base of an amplifier. Then the three signals are in phase with one another at the amplifier's input and output.

(a) A resistor network (crossconnected voltage divider) determines that the amplitude of the Y amplifier output will consist of 30 percent red, 59 percent green, and 11 percent blue. This Y signal corresponds to the variations of brightness in the scene being televised. This is the signal received by a black and white TV receiver, and is the brightness component in a color receiver.

(b) The I signal is formed by applying the red signal to the base, and the blue and green signal to the emitter of the I amplifier (fig 1-20). This circuitry determines that the output of the red signal will be 180 degrees out of phase with the other two color signals. Thus the designation is +60 percent red, +28 percent green, and +32 percent blue. The polarity signs only indicate phase relationships. The resistor network determines the amplitude of the signals.

(c) The Q signal is formed by applying the green signal to the base and the red and blue to the emitter of the Q amplifier. Here, the green is 180 degrees out of phase with the red and blue. The resistor network sets the percentages at -52 percent green, +21 percent red, and 31 percent blue (fig 1-21).

Figure 1-20. I matrix

Figure 1-21. Q matrix

c. Band limiting and delay. The outputs of the individual matrix sections feed the filter section (fig 1-19). The filter section establishes a bandpass for each of the video signals, 4.1 MHz for Y, 1.5 MHz for I, and 0.5 MHz for Q. The channel is broad-banded but has vestigial-sideband characteristics because of the upper-frequency cutoff of the transmitter (fig 1-24). This channel is single-sideband for frequencies higher than 0.5 MHz. Transmission of frequencies up to 0.5 MHz is double-sideband on both the I and Q channels.

(1) This operation allows two types of receiver action: One, the receiver may use the extra color information in the wideband I channel, or, two, receivers may ignore this extra information and reproduce only chrominance detail supplied up to 0.5 MHz.

(2) Because the Y, I, and Q are different bandwidths, and since their envelopes must have a specific placement in time with regard to each other, the I and Y signals are sent through delay networks so that all three signals have the proper time placement when applied to the mixer (adder) section.

d. Two-phase modulation (generation of the color signal). The I and Q output of the filter section feeds two doubly-balanced modulators, where two-phase modulation takes place (fig 1-19).

(1) Two-phase modulation is a technique by which the I and Q signal scans are combined into a two variable signal for transmission over a single channel.

(a) This is accomplished by adding sidebands obtained through modulation of two 3.58 MHz carriers separated in phase by 90 degrees. The resultant waveform is the vector sum of the components. The two carriers, which are derived from the same oscillator, are suppressed by doubly balanced modulators. Thus, only the two amplitude modulated sidebands, 90 degrees out of phase, are transmitted.

(2) At the receiving end of the system, the I and Q signals are recovered by heterodyning the two-phase wave against two locally generated carriers of the same frequency (but with a 90-degree separation), and applying the resultant signals through low pass filters to other matrix circuits in the receiver.

(3) Figure 1-22 illustrates a simplified diagram of a doubly-balanced modulator. The input stage is a pair of differential amplifiers which supplies signal output of equal amplitude, 180 degrees out of phase with the input.

Figure 1-22. Doubly balanced modulator

(4) Looking again at Figure 1-19, one can see that the 3.58 MHz CW subcarrier is applied to the I and Q modulators through delays. The I signal is delayed 57 degrees from subcarrier and the Q signal is delayed $57 + 90$ or 147 degrees away from subcarrier. This corresponds to the I and Q vectors shown in figure 1-18. Also, the subcarrier is applied to a burst keyer where a portion of the subcarrier is inserted onto blanking for use as a color sync.

e. Color synchronization signal. Since the subcarrier is suppressed at the colorplexer, the local 3.58 MHz oscillator at the receiver must be accurately synchronized in frequency and in phase with the master oscillator at the transmitter. In order to maintain these two oscillators in phase, a short burst of the transmitter 3.58 MHz oscillator voltage is transmitted at the beginning of each horizontal scanning line.

(1) The burst is generated at the color frequency standard generator by a gating circuit which is turned on by burst keying pulses derived from a device known as a burst flag generator. This device is also locked in with the station sync generator.

(2) The burst consists of approximately 8 to 11 cycles of the 3.579545 MHz signal and is placed on the back porch of the horizontal blanking pedestal next to the horizontal sync pulse, and all are placed in the horizontal blanking interval (fig 1-23). FCC standard phase relationships between I and Q signals and the color synchronizing burst are shown in the vector diagram (fig 1-18). The I and Q signals are transmitted in phase-quadrature, and the color burst (referred to as reference subcarrier) is transmitted with an arbitrary 57-degrees phase lead over the I signal.

f. In the mixer section of the colorplexer, the outputs of the Y, I, Q, and burst keyer sections are added together to form the composite color signal (also, sync is added in the luminance channel for a single color camera chain). The bandpass is now formed with the addition of the I and Q signal,

	NOMINAL MICROSECONDS	TOLERANCE MICROSECONDS
BLANKING	11.1	+0.3 -0.6
SYNC	4.76	± 0.32
FRONT PORCH	1.59	+0.13 -0.32
BACK PORCH	4.76	+0.96 -0.61
SYNC TO BURST	0.56	+0.08 -0.17
BURST	2.24	+0.27 0
BLANKING TO BURST ¹	6.91	+0.08 -0.17
SYNC & BURST	7.56	+0.38 -0.49
SYNC & BACK PORCH	9.54	± 0.32

Lesson 1
PRACTICE EXERCISE

1. Brightness is synonymous with which of the following terms?
 - a. Frequency
 - b. Contrast
 - c. Light
 - d. Amplitude
2. What is the horizontal scanning rate for color transmission?
 - a. 60 Hz
 - b. 15750 Hz
 - c. 59.94 Hz
 - d. 15734.26 Hz
3. How many primary colors are required to produce any hue for a small object?
 - a. Two
 - b. Three
 - c. Four
 - d. Five
4. What is the color produced when 59 percent green is combined with 30 percent red?
 - a. Cyan
 - b. Yellow
 - c. Magenta
 - d. White
5. What is the science of determining and specifying colors?
 - a. Additive mixing
 - b. Subtractive mixing
 - c. Luminosity
 - d. Colorimetry
6. What does hue define in a color?
 - a. Wavelength
 - b. Luminance
 - c. Saturation
 - d. Purity

Lesson 2
DESCRIBE THE COLOR BAR TEST SIGNALS

TASK

Describe and identify the four basic color bar test signals.

CONDITIONS

Given information and illustrations relating to the four basic color bar test signals.

STANDARDS

Demonstrate competency of task skills and knowledge required for identification of the color bars signals discussed in this lesson by correctly responding to 80 percent of the multiple-choice test questions covering the four basic color bar test signals.

REFERENCES

None

Learning Event 1:

DESCRIBE THE ENCODED COLOR BARS TEST SIGNAL

1. The encoded color bars signal. The Electronics Industries Association (EIA) standard for the encoded color bars signal is established in their recommended standard RS-189. RS-189 provides the specification of the encoded color bars signal and its various applications. Some of the most common uses of this signal involve rapid checks of television transmitters, performing timing checks of production switchers, leader reference signals on video tapes, and to serve as a calibration signal for the adjustment of color monitors and encoders.

2. The encoded color bars signal consists of two major parts. The first three-fourths of the active scanning lines in each field are divided into seven equal intervals. These intervals represent one luminance interval and six chrominance intervals. The intervals are arranged in descending order of luminance from left to right as you observe a picture monitor or waveform monitor (fig 2-1).

a. The first interval, Gray (TV White), not to be confused with peak or reference white, has a luminance level of +77 IRE. This luminance level is normally associated with nonmodulated

font. The six remaining luminance intervals are chrominance modulated in the following order: Yellow, Cyan, Green, Magenta, Red, and Blue. The luminance level for yellow is +69 IRE and the chrominance modulation level is +/31 IRE. Luminance for Cyan is +56 IRE and chrominance modulation is +/- 44 IRE. Luminance for Green is +48 IRE and chrominance modulation is +/- 41 IRE. Luminance for magenta is +36 IRE and chrominance modulation is +/41 IRE. Luminance for Red is +28 IRE and chrominance modulation is +/- 44 IRE. Luminance for Blue is +15 and chrominance modulation is +/31 IRE. These colors correspond to saturated colors transmitted at 75% of full amplitude.

b. The remaining one-fourth of the active scanning lines in each field are used for the transmission of special test information. This information consist of a subcarrier signal envelope with a phase corresponding to -I, a reference white pulse with peak amplitude of 100 IRE, a subcarrier signal envelope with a phase corresponding to +Q, and a reference black interval (fig 2-2).

Learning Event 2:
DESCRIBE THE ALIGNMENT COLOR BARS TEST SIGNAL

1. Alignment color bar test signal. The Society of Motion Picture and Television Engineers (SMPTE) published a journal containing an engineering committee report, ECR 11978. The recommendation specifies the purpose, format, and usage of a television picture monitor alignment color bar test signal with chroma set and black set signals.

2. The alignment color bar test signal is intended to standardize the adjustment of chroma gain, chroma phase, and black level monitor controls.

a. Chroma gain and chroma phase for picture monitors are conventionally adjusted by observing the standard encoded color bars signal with the red and green monitor guns switched off. The four visible blue bars are adjusted for equal brightness. This procedure is prone to error because of the subjective judgement necessary and especially because the blue bars are widely separated on the screen.

b. The use of the chroma set signal portion of the alignment color bar test signal greatly increases the accuracy of this adjustment since it provides a signal with the blue bars to be matched vertically adjacent to each other. Because the bars are adjacent, the eyes can easily perceive any difference in brightness. It also eliminates effects due to shading or purity from one part of the monitor to another.

c. Black level for picture monitors is conventionally adjusted by observing a known black portion of the signal and matching it to a blanked area of the signal. This procedure is also prone to error due to the subjective judgment necessary to make the match. The use of the black set signal portion of the alignment color bar test signal greatly increases the accuracy of this adjustment since it provides a positive go-no-go criterion for the proper setting. It also minimizes errors due to variations of ambient light.

3. Figure 2-3 shows the appearance of the EIA standard RS-189-A encoded color bar signal as it would appear on a picture monitor. Figure 2-4 shows the appearance of the alignment color bar test signal as it would be displayed on a picture monitor.

4. The SMPTE color bar signal consists of 67% of the field with the standard seven color bars, 8% of the field with the new chroma set signal, and the remaining 25% with the combination of the -I, white, Q, black, and the black set signal. The seven color bars signal is identical to the one used for the EIA signal, except for the percentage of the field it occupies.

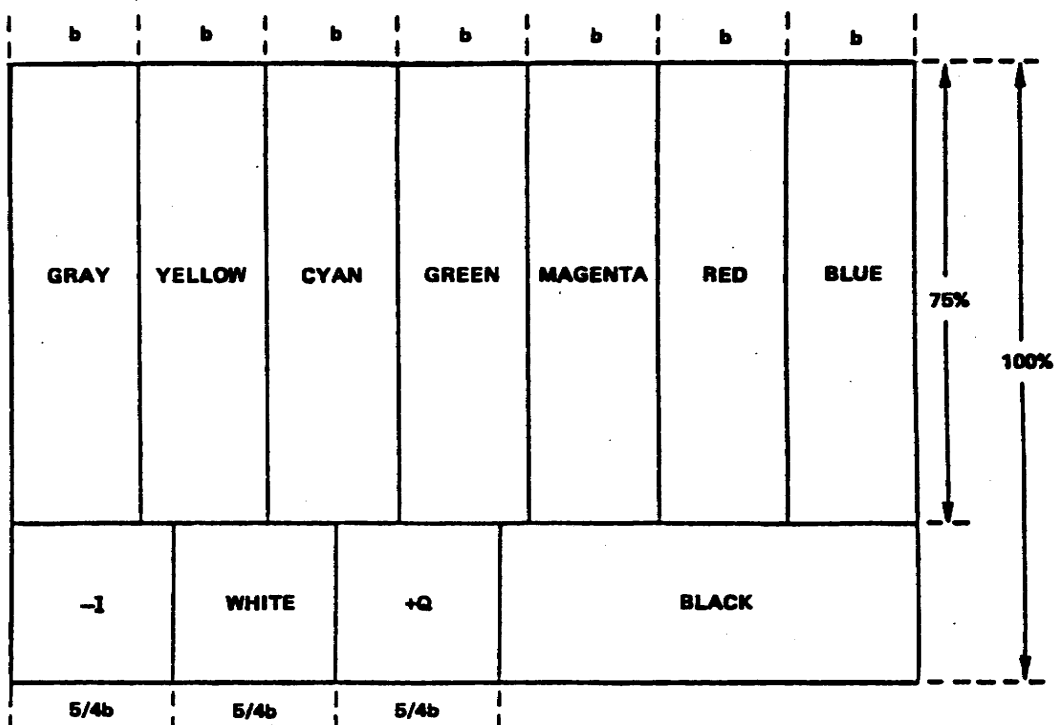

Figure 2-3. EIA standard RS-189 encoded color bars signal

Figure 2-4. SMPTE alignment color bar test signal

a. The chroma set signal is made up of the color bars, containing blue, in reverse order. The color bars signal contains blue in every other bar (blue, magenta, cyan, and white). The color set signal consists of four color bars, separated by black bars (fig 2-5a). The color bars which contain blue are placed beneath the EIA color bars that also contain blue, but in reverse order; blue beneath white, magenta beneath cyan, and vice versa. To maintain timing, the color set signal bars are separated by black bars of equal duration.

Figure 2-5a. One line of chroma set signal, X-X1

b. The -I, W, Q, and B signals, used in the SMPTE color bar signal, contain a black set signal (fig 2-5b). Its location and duration are identical to those of the red color bar. The signal itself is made up of three black amplitudes, 3.5 IRE, 7.5 IRE, and 11.5 IRE. This provides levels that are 4 IRE above and below the setup level, making it possible to compare small differences in the black level.

5. As stated earlier in this lesson, the SMPTE color bars signal is used for making phase and gain adjustments in color monitors and for verifying overall accuracy of the decoding functions. An experienced operator can learn to judge the accuracy of monitor adjustments by direct observation of the color bar pattern. For more objective measurements, the waveforms resulting from the decoding of the color bars signal can be used. For example, the phase and gain adjustments may be checked by observing the waveforms at appropriate points. The luminance component of the color bars signal provides a convenient grey scale display for setting color balance and tracking on color monitors.

a. The accuracy of matrix and phase adjustments in encoders may be readily checked by comparison of the color bars signal with the output of such a device when the signal is applied to the encoder inputs.

Figure 2-5b. One line of black set signal

b. The color bars signal embodies several convenient reference relationships that facilitate its use. The relative amplitudes of all signal components can be checked by direct observation of the complete waveform on a television waveform monitor. A waveform monitor should display the relationships a, b, and c, illustrated in figures 2-6 and 2-7.

(1) The positive peak levels of the yellow and cyan bars are nominally equal to reference white level.

(2) The negative peak level of the green bar is nominally equal to reference black level, when 7.5% setup is used

(3) The negative peak levels of the red and blue bars are nominally equal (-16 IRE).

c. The relative phases and amplitudes of the chrominance portion of the signal are generally checked by observation on a vectorscope. The quadrature phase relationship between I and Q components of the encoded signal can be conveniently checked by observation of the -I and Q signal axes (fig 2-8).

Figure 2-6. Chroma amplitudes

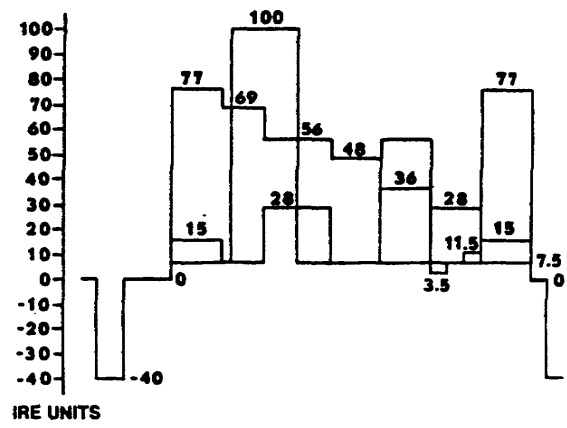

Figure 2-7. Luminance levels

Figure 2-8. Vectorscope graticule

6. The chroma and black set signals are used to set the chroma, hue, and brightness of a picture monitor. The chroma and hue controls are set by comparing the blue chrominance from the color bars to the blue chrominance of the reverse color bars. The only required setup to making these adjustments is that the monitor must be in a blue-only mode. This is done by turning off the red and green screens.

7. The procedure for adjusting a monitor is as follows:

- a. Turn off the picture monitor's red and green screens.
- b. Compare the extreme left or right blue bar with the reverse color bar segment directly below it. Adjust the monitor chroma control until there is no color difference (fig 2-9).
- c. Next, compare either of the center blue bars to the reverse color bars segment directly below it. Adjust the monitor hue control until there is no color difference (fig 2-9).

Figure 2-9. SMPTE chroma and hue set matching diagram

d. With all three of the monitor's screens turned on at ambient viewing conditions, adjust the brightness control until the gray 11.5 part of the black set signal is just visible, but the difference between the blacker than black (3.5 IRE) and the black (7.5 IRE) segments is not discernable (fig 2-10).

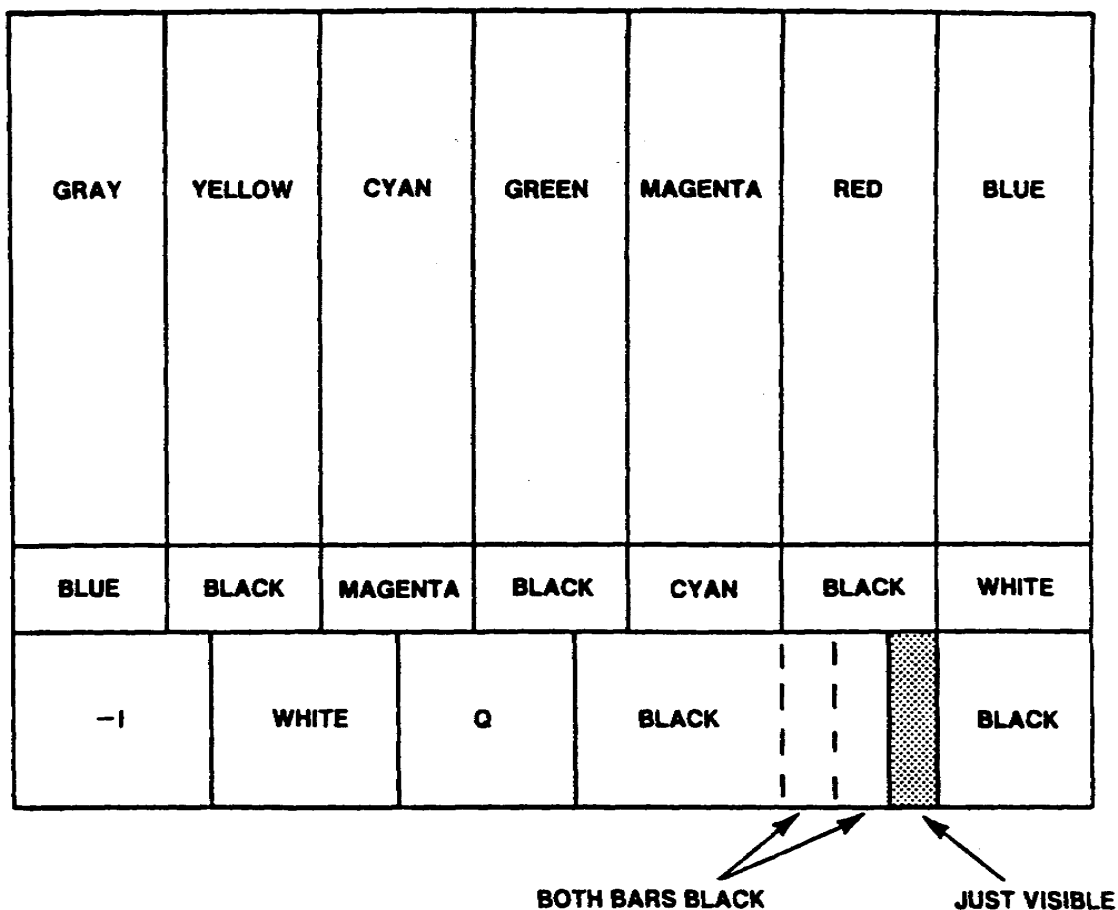

Figure 2-10. SMPTE black set matching diagram for brightness

Learning Event 3:

DESCRIBE FULL FIELD AND GATED-RAINBOW PATTERN COLOR BARS

1. The full field color bars signal consists of eight equal intervals arranged in descending order of luminance amplitudes as follows: Gray, Yellow, Cyan, Green, Magenta, Red, Blue, and Black (fig 2-11). This signal is normally used for checking luminance, hue, and saturation parameters of the television system.

Figure 2-11. Full field color bars signal

2. The paragraphs describing the EIA and SMPTE color bars apply to the full field color bars, with exception of use of the -I, W, Q, B, chroma set, and black set signals. The full field color bars does not utilize the latter signals.

3. Certain color bar generators like the Tektronix TSG1 and TSG7 can alter the sequence of the full field color bar pattern for various test applications. The following is a sample of some of the different applications:

a. Split-field Y reference signal. This signal provides color bars in the first half of the field and luminance only gray scale in the second part of the field (fig 2-12). The split-field Y reference signal is especially useful for checking color balance and tracking of color picture monitors, chrominance-luminance delay, and chrominance-luminance intermodulation.

b. Split-field red signal. This signal includes the color bars in the first half of the field, while the second half of the field contains the red color bar signal only (fig 2-13). Video system noise, VTR head-banding, and red phase are readily seen using the solid red split field signal.

c. Split-field reverse signal. This signal consists of standard color bars in the first half of the field, followed by color bars in reverse order in the second half of the field (fig 2-14). This signal is useful in checking velocity modulation in video tape recorders.

Figure 2-12. Split-field Y ref

Figure 2-13. Split-field red

Figure 2-14. Split-field reverse

4. The gated rainbow pattern, is a ten-color bar pattern and is shown in Figure 2-15a as it appears on a TV receiver. In Figure 2-15a the sequence of each color is separated by a black vertical line. The black line is caused by gating off the signal between colors. The color bars are each separated in phase by 30 degrees, beginning with burst phase at 0 degrees. There is no bar corresponding to 330 degrees.

a. The appearance of the gated rainbow signal on an oscilloscope is shown in Figure 2-15b. Note the color burst signal, the ten color-bar signals, blanking between the color signals, and horizontal sync pulses. The color burst signal is on the back porch of horizontal sync the same as a TV station signal. However, there is no Y signal component associated with the gated-rainbow color bars. The gated-rainbow color bar pattern displays the bars with equal saturation and brightness levels on the color picture tube.

b. Another point about the gated-rainbow pattern is that the subcarrier frequency is exactly 3.563811 MHz. This differs by precisely 15 734 Hz from the 3.579545 color subcarrier frequency generated in the color TV receiver. As a result of this precise frequency difference, the phase of the color pattern signals shift through exactly 360 degrees for each horizontal line. Thus, the pattern repeats identically on every line, forming the vertical color bars.

(1) The comparison between the two subcarrier signals is performed by two color demodulators in the TV receiver. The output signals from the color demodulators and color matrix (now at video rate) are fed to the red, green, and blue guns of the color picture tube to produce the actual color bars.

(2) The gated-rainbow pattern color bar signal is generally used for the servicing of TV receivers. Some of the basic applications of this signal are confined to adjusting color automatic frequency circuits, phase control circuits, color amplitude circuits, and color synchronizing circuits.

Lesson 2
PRACTICE EXERCISE

1. What is a common use of the encoded color bars signal?
 - a. Rapid check of servo systems
 - b. Performing timing checks
 - c. Linearity checks
 - d. Resolution checks
2. What is the chrominance modulation percentage for the green luminance level?
 - a. $\pm 31\%$
 - b. $\pm 41\%$
 - c. $\pm 44\%$
 - d. $\pm 51\%$
3. What percentage of the field contains color bars in the SMPTE signal?
 - a. 8%
 - b. 50%
 - c. 67%
 - d. 75%
4. What two chrominance values have peak levels equal to the white reference level?
 - a. Green and gray
 - b. Gray and yellow
 - c. Yellow and cyan
 - d. Cyan and green
5. How many intervals are contained in full field color bars?
 - a. 6
 - b. 7
 - c. 8
 - d. 9
6. How many degrees in phase is each color separated in the gated-rainbow pattern?
 - a. 10
 - b. 20
 - c. 30
 - d. 40

Lesson 3
DESCRIBE THE BASIC ELECTRONIC TELEVISION TEST SIGNALS

TASK

Describe and identify five basic electronic television test signals.

CONDITIONS

Given information and illustrations pertaining to the basic television test signals.

STANDARDS

Demonstrate competency of task skills and knowledge required for identification of the test signals discussed in this lesson, by correctly responding to 80% of the multiple-choice test questions covering five basic electronic television test signals.

REFERENCES

None

LEARNING EVENT 1:

DESCRIBE THE MULTIBURST SIGNAL AND GRAY-SCALE LINEARITY TEST SIGNAL

1. The multiburst signal consists of a white-flag reference pulse, followed by six bursts of individually keyed sine waves in ascending frequency order. This signal is useful as a quick systems check for rapid visual presentation of amplitude-frequency response, usually to 4.2 MHz.

a. The basic block diagram of a multiburst generator is shown in Figure 3-1. The unit normally receives composite sync and composite blanking from the local sync generator. For field use, self-contained (internal) is usually available.

b. Horizontal drive is derived from incoming sync and used to trigger and synchronize six individual sine wave oscillators. It is also used to generate a white-flag pulse at the beginning of active horizontal sweep.

(1) Normally, the white-flag pulse width is adjusted for 8 microseconds. The trailing edge of this pulse triggers

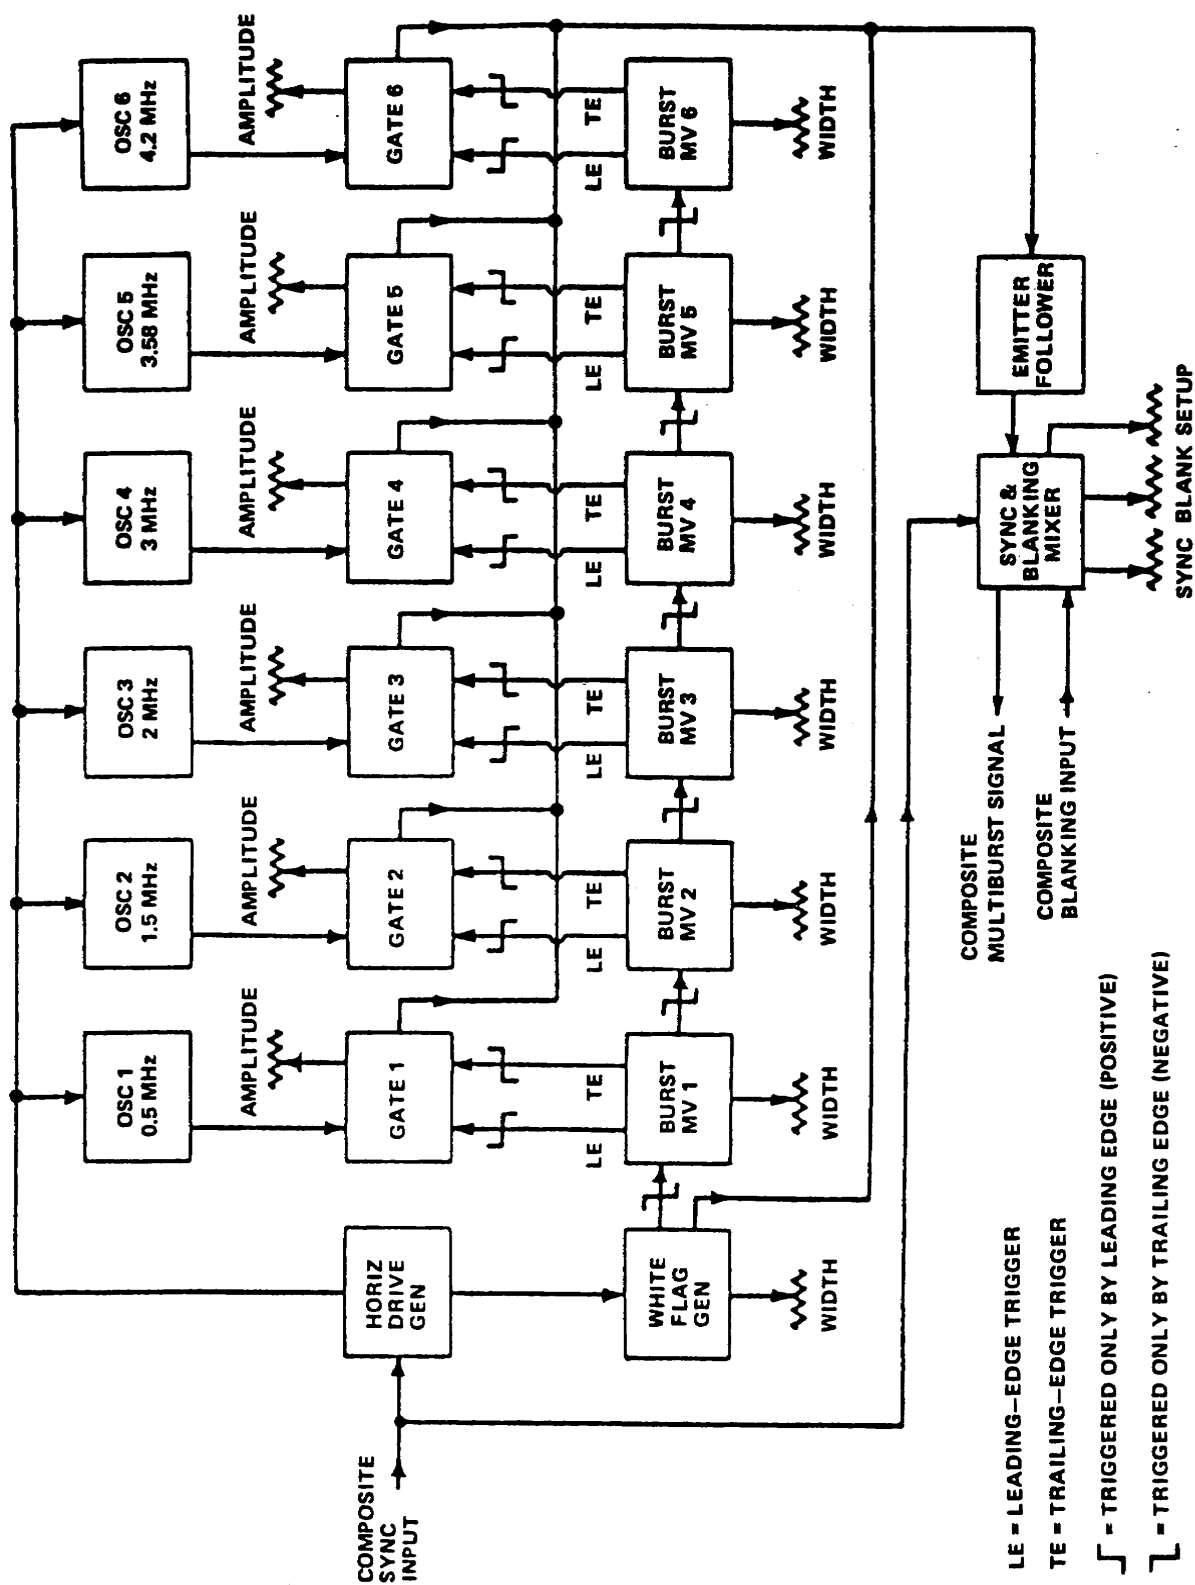

Figure 3-1. Basic block diagram of a multiburst generator

burst multivibrator MV1 on; this multivibrator is set to produce a pulse width of about 7 microseconds, as are all following multivibrators.

(2) The leading edge of the pulse from MV1 gates the signal from oscillator 1 on, and the trailing edge gates the same signal off. The trailing edge also gates MV2 on, and so forth. Thus, the output signal consists of the white-flag and six sine wave bursts on a time-shared basis during each line interval.

c. The signal and frequencies from left to right consist of white-flag, 0.5, 1.5, 2, 3, 3.58, 4.2 megahertz signals as illustrated in Figure 3-2. The multiburst test signal is inserted on the odd field of line 17 of the vertical blanking interval. The frequencies shown are those normally used for a standard multiburst signal. However, some multiburst signal generators facilitate multiburst test signals with frequencies as high as 12 MHz.

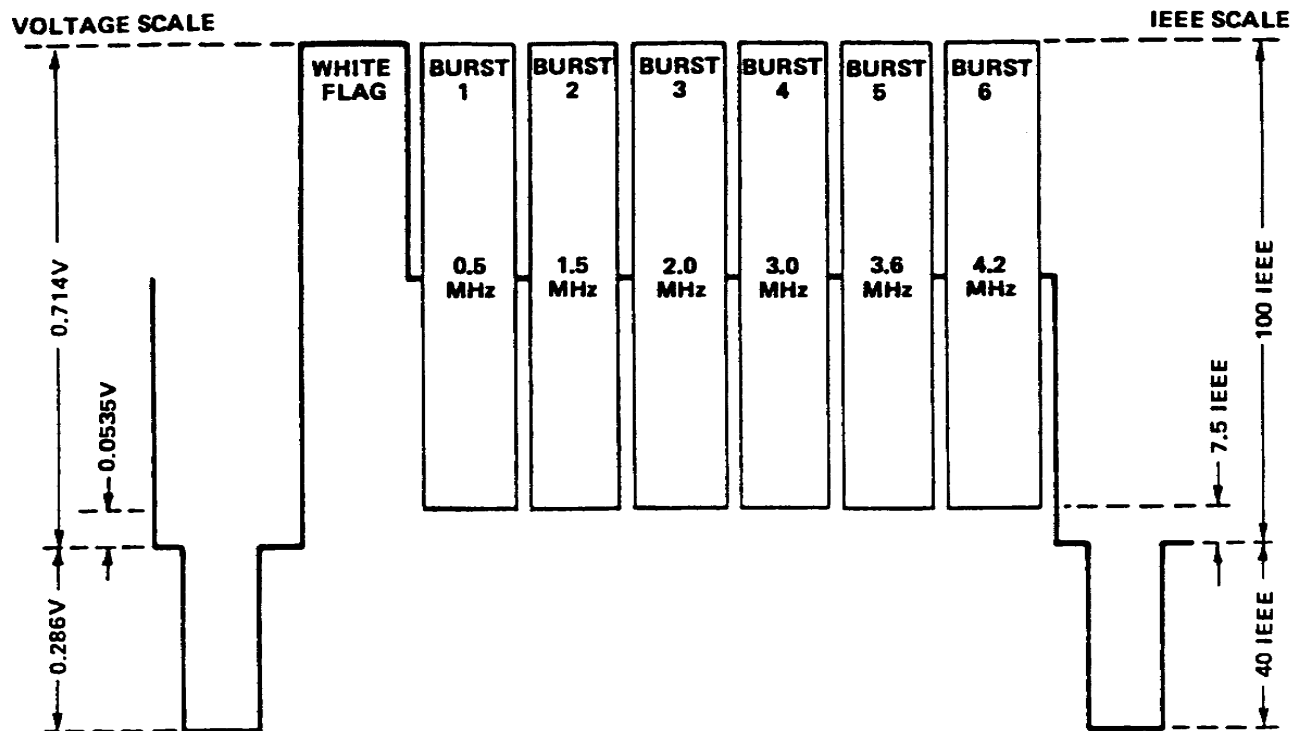

Figure 3-2. Standard multiburst signal

2. The transmission of video information over long lengths of cable degenerates the signal through frequency-dependent losses of the cable. One application of the multiburst signal is to set equalization controls on distribution amplifiers with provision for compensating cable losses.

3. Another frequently used application of the multiburst signal is in the evaluation of common carrier transmission. The multiburst signal is VITS keyed in the vertical interval for insertion into a televised program. This allows for in-service testing of the transmission path.

4. The gray-scale linearity (stairstep or sawtooth) signal is used to explore the entire picture region from black to white by means of linear variation of amplitude with time. It is useful in measuring nonlinear distortion in the system transfer characteristic.

a. Either a stairstep with well-controlled rise-time steps, or a line-duration sawtooth is suitable for nonlinear measurements. A stairstep signal consisting of 10 steps repeated every line and the sawtooth ramp is shown with subcarrier in Figures 3-3a and 3-3b. Small non-linearities throughout the grayscale are more easily observed on this type of signal than is possible with the plain sawtooth signal, since each of the 10 steps falls exactly on a graticule line when an IRE scale is used.

Figure 3-3a and 3-3b
(A) 10 Step linearity with subcarrier
(B) Sawtooth ramp with subcarrier

b. Sensitivity of measurement for either the stairstep or sawtooth is increased by superimposing 20 IRE units of 3.58 MHz subcarrier. Any non-linearity then results in amplitude variations of the pulses when observed through a high pass filter. This technique also allows measurement of non-linearity at the color subcarrier frequency relative to low-frequency steps. Such distortion is termed "differential gain".

5. Grayscale test signals must be able to convey information at low and high frequencies over every possible picture value likely to be encountered. This picture value is interpreted not only by amplitude, frequency, and phase response of the system but also on a widely varying duty cycle. Duty cycle in pulse work simply correlates the pulse duration with the pulse-repetition frequency (PRF):

$$\text{Duty cycle} = \text{pulse duration} \times \text{PRF}$$

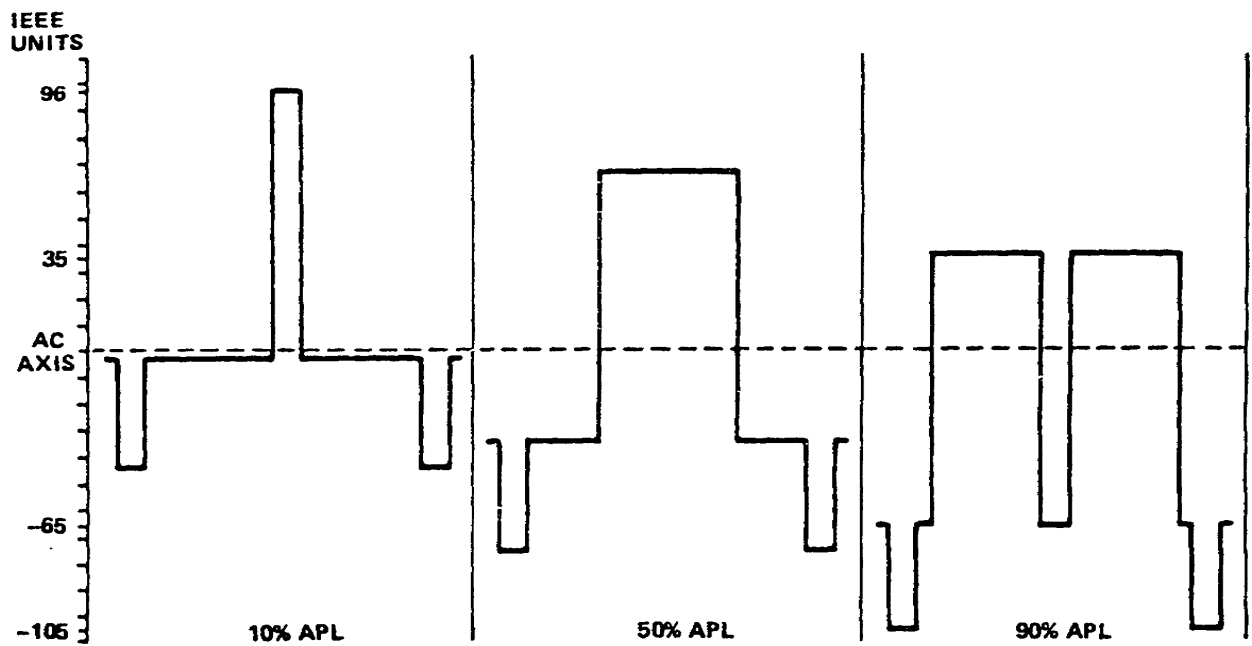

For television, this effect is most appropriately termed "average picture level" (APL). The amplitude, frequency, and phase response of the system must be held within tolerable limits over the gamut of APLs encountered in practice.

6. Even experienced TV engineers sometimes forget that a 1-volt peak-to-peak video signal must be transferred through an amplifier capable of handling twice this range with little degradation (figure 3-4). Although the DC component is restored at such points as blanking insertion, sync insertion, gamma-correction stages, and transmitter modulators, practically all stages in between, as well as distribution and stabilizing amplifiers, are AC coupled.

a. Waveform monitors such as those in master monitor positions use clamping circuits to hold blanking level at the reference graticule line. Some scopes designed for waveform monitoring allow switchable operation, either clamped or unclamped. Even though the monitoring CRO is clamped, "bounces" of a momentary duration will occur upon drastic scenic changes in APL, and this is normal. Most scopes for routine testing and servicing do not use DC restorers or clamping circuits.

(A) DC COUPLED (DC COMPONENT)

(B) AC COUPLED (NO DC COMPONENT).

Figure 3-4. Variation of signal excursions with APL

b. Figure 3-5 presents the specifications for the stairstep generator test signal when provided with variable APL. The linearity test signal generator sometimes includes provisions for inserting horizontal sync only. In this case, the blanking width should be set for 25 percent of a line period (15.8 microseconds). If fed through equipment where composite station blanking is inserted, the normal station blanking pulse should cover the test generator blanking output (maximum of 11.4 microseconds horizontal with 7 percent vertical blanking).

Figure 3-5. Specification for the stairstep signal

Learning Event 2:

DESCRIBE THE VERTICAL INTERVAL TEST SIGNAL (VITS) AND THE VERTICAL INTERVAL REFERENCE SIGNAL (VIRS)

1. Vertical Interval Test Signal (VITS). In the standard television signal there is, immediately following each vertical-synchronizing interval, a series of 20 or 21 horizontal lines which carry no video information. In a receiver or monitor, these lines provide an interval which ensures that the vertical retrace is complete before any video information is received and are intended to perform no other function.

a. The lines normally appear on a monitor as a gray band across the top of the picture; usually this band is adjusted so that it is behind the mask. While these are actually horizontal lines, they are conveniently considered as a part of the vertical-synchronizing interval.

b. By using suitable keying equipment, it is possible to introduce information onto one or more of these blank lines to be transmitted to a specific destination. If desired, this information can be blanked out at the receiving point before the signal is put on air, or since it is not normally visible on the receiver, it may be broadcast.

c. The NTSC established VITS on lines 17 and 18, and line 19 for transmission of the VIR test signals. The Major networks and Bell Systems, working through the Network Transmission Committee, are working to development methods to place other test and coded signals into the other lines of the vertical blanking interval.

d. The advantage, of course, of introducing these signals in the vertical interval is that a system can be checked in service, and digital information can be passed along the transmission links while a program is actually being transmitted. To this end, it is also desirable that all these signals be available for nearly simultaneous observation, and this is the ultimate objective.

2. The specification and standards for the VITS are illustrated in Figures 3-6, 3-7 and 3-8.

3. Vertical interval reference (VIR) signal. The VIR signal is a program-related reference signal inserted during the vertical blanking interval of a color television program. It is intended to reduce undesirable variations in color throughout the television system by assisting television producers, technicians, and operators in adjusting various signal parameters so that different programs and program segments have similar amplitude and phase characteristics whether viewed sequentially on the same channel or on different channels.

a. The VIR signal is also intended to be associated with televised programs as an operational tool for checking the parameters of the programs and is a reference for the programs being transmitted. The VIR signal, however, is not intended to provide quantitative data on transmission distortions.

b. Because the VIR signal is intended to be associated with a particular program, it should only be inserted into the program signal at a point in the video system where both the correct amplitudes and phase of the composite color signal are established and the artistic judgement is made that color reproduction is as desired. Thus, it is the responsibility of each production organization to make that artistic judgement.

(1) Once the VIR signal is inserted in this manner, it represents a certification of and a reference for the program signal. After the VIR signal has been inserted into the program signal, it must be treated exactly like the program signal in all equipment through which it passes so that the VIR signal will always correspond to the program.

(2) Then, when adjustments are made to restore a VIR signal to its proper characteristics at any point in the video system, the program will have been re-established to essentially the same characteristics as when it was initially certified.

(3) The VIR signal inserted at the point of certification should remain with the program to its final destination. Exceptions to this practice should be made only at a point of recertification, such as an assembly point of various program segments.

c. One important application of the VIR signal is in the adjustment of a reproduced video tape recording. This usage applies to all video tape formats used for broadcasting and is important both for the playback of a single tape and the sequential playback of several short commercial program segments. The VIR signal will be added to each video tape at a point prior to the duplication of the final release copies. This will be done after the correct signal parameters are established and any necessary artistic judgements have been made as to proper color reproduction. The program then will have been certified.

d. When a VIR signal is present on a signal to be recorded on a video tape recorder, the VIR signal as passed by the video tape recorder shall be considered as reference for either manual or automatic adjustment of the reproduced signal characteristics listed below:

Luminance amplitude -----	50 Peak IRE
Black level amplitude -----	7.5 IRE
Sync amplitude -----	-40 Peak IRE
Chrominance -----	90 Peak IRE
Color burst amplitude -----	+/- 20 IRE

e. The VIR signal will be recorded by only one head of a multihead video tape recorder. Since it is essential to balance head output levels, this characteristic does not reduce the usefulness of the VIR signal. The waveform of the VIR signal is shown in Figure 3-9.

Figure 3-9. Standard vertical reference signal

Learning Event 3:
DESCRIBE THE SIN2 WINDOW SIGNAL

1. The sin2 window signal is normally accompanied by a half-line and half-field window pulse, which is sometimes termed a "bar". Figure 3-10 shows a basic block diagram of a generator which also includes the modulated 20T pulse.

a. The timing circuit driver (monostable multivibrator) is triggered from the leading edge of sync and generates a rectangular pulse of about 16 microseconds duration. The trailing edge of this pulse initiates the operation of the pulse and window timing circuit, which positions the pulse and window leading and trailing edges relative to sync. Blanking pulses are used to inhibit the timing circuit action during field blanking. The output of the impulse generator is an 18-nanosecond spike which becomes the Tpulse after shaping in the T-pulse shaping network. A switch is normally provided so that either 2T, T, or T/2 pulses are available. Note also that the leading and trailing edges of the window signal, since they pass through the same shaping filter, have the same rise and fall times as the associated T pulse.

b. The 20T pulse is shaped by appropriate sin2 filters and applied to a double-balanced 3.58-MHz modulator in a manner similar to that in which chroma information modulates the color subcarrier in an encoder. Thus, both the 3.58-MHz carrier and the original 20T pulse are cancelled, and the output is the modulated sidebands of the carrier. This produces the modulated T pulse envelope (fig 3-10). Finally the original 20T pulse is linearly (resistively) added to the modulated pulse, producing the symmetrical pulse with a base line.

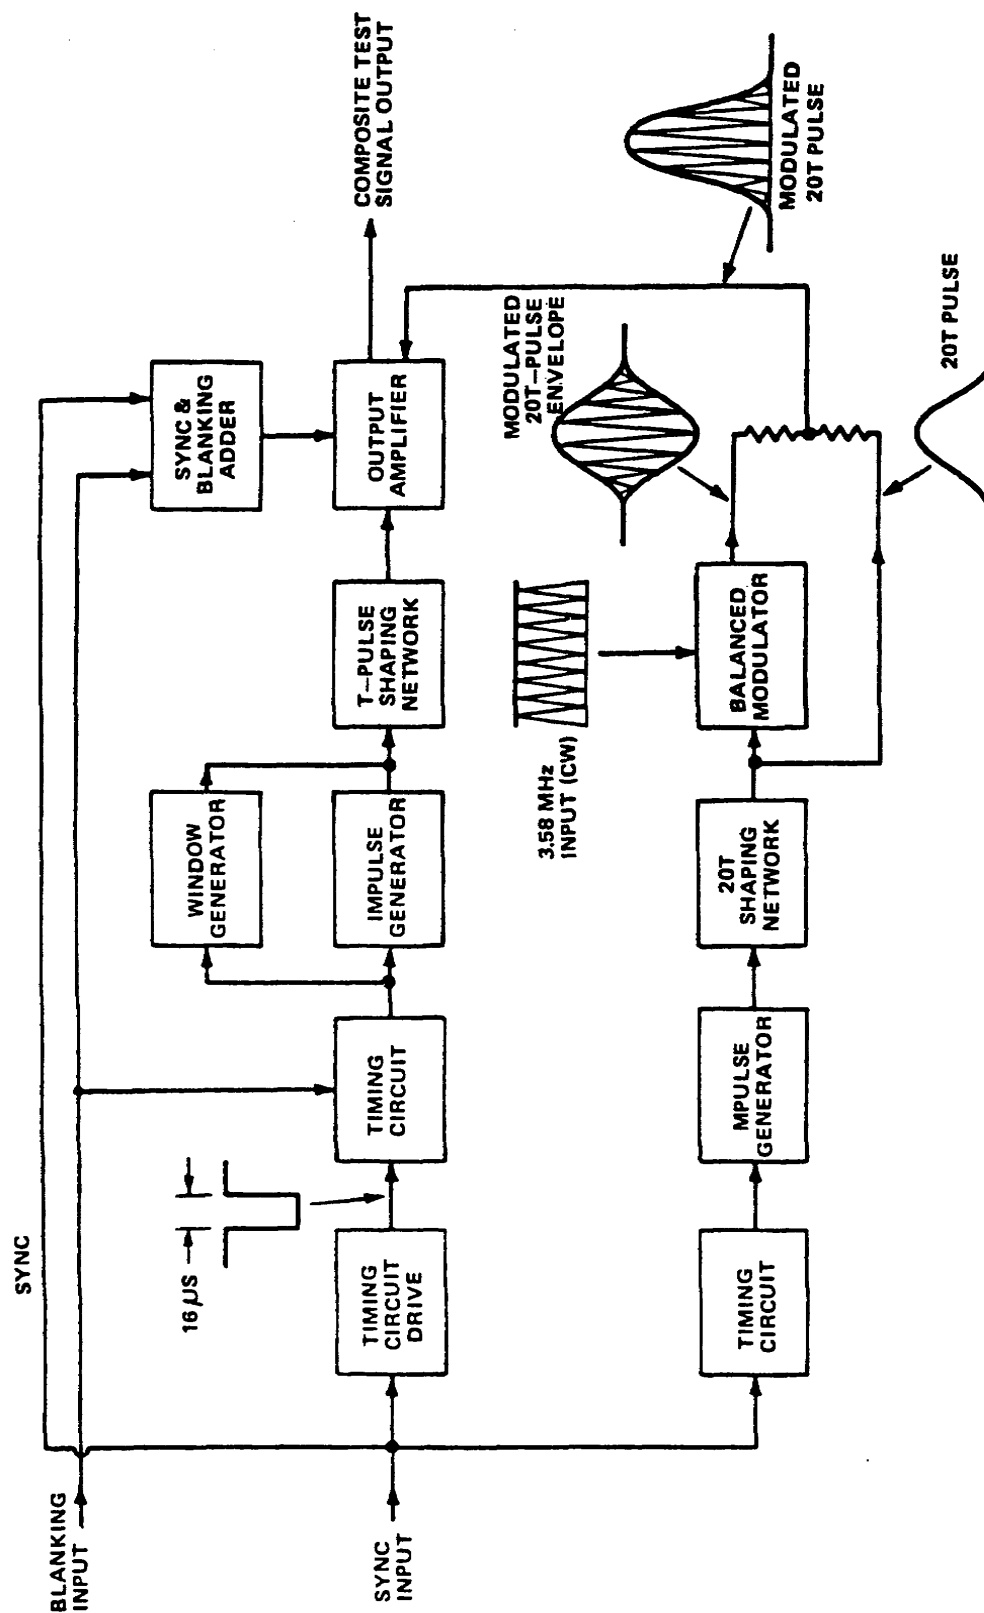

Figure 3-10. Basic block diagram of sin2-pulse and window generator

(1) Figure 3-1a, gives the line-rate specifications of the standard pulse-bar signal, with relative timing from the leading edge of horizontal sync. Figure 3-11b, gives the field rate specifications of the same signal.

(A) LINE RATE.

(B) FIELD RATE.

Figure 3-11. Pulse-window signal specifications

(2) Figure 3-12, illustrates the addition of the modulated 20T pulse to the composite test signal. Figure 3-12 displays two consecutive lines in which the window occupies one line and the pulses are contained in the following line. In Figure 3-13, the pulse and window are generated in each single line. In some generators, the positions of the pulses are interchanged; i.e., the T or 2T pulse precedes the modulated 20T pulse.

Figure 3-12. Display of 20T, T pulse and window

Figure 3-13. One-line display of 20T, T pulse and window

(3) The type of display convenient for one of the tests associated with this signal occurs when all the pulses and the window are in a single line. The scope must be double triggered; that is, it must be triggered from successive sync pulses. The two consecutive-line signal (fig 3-12) eliminates the need for double triggering, since a repetitive sweep automatically provides the double-triggered display. However, the two-consecutive-line signal has the disadvantage of being subject to error from frequency distortion because of the large difference in APL between the two separate lines (window on one line and pulses on the other).

2. Use of the pulse-window signal in practice involves, a special graticule to indicate certain K-factors, particularly for routine testing to provide a quick observation to go no/go quality.

3. In an attempt to correlate test-signal measurement with an actual degree of picture impairment, the K-factor is used. The K-factor is basically defined in terms of a standard picture distortion which is a single echo spaced in time $8T$ or more from the main transition. For example, if the peak amplitude of this single echo is 4 percent of the original transition amplitude, the K-factor is 4 percent.

a. In Figure 3-14, "A" signal transition with a sine squared shape occurs at $t = 0$. At a point spaced at $+8T$, a certain amplitude of "ring", or echo, exists. Let us arbitrarily assume that this amplitude is 4 percent of the original amplitude, so $B = 4$ percent. Waveform distortion A (fig 3-14) much closer to the transition is larger, but its effect, as judged by an average observer, is only equal to the picture impairment caused by echo B. Thus, although echo A may be 16 percent of the original amplitude, echo B, of only 4 percent amplitude, results in the same degree of picture impairment. We may construct a graticule mask which defines limits within which a waveform must fit if it is to have a K-factor equal to or less than the limits specified.

Figure 3-14. Basic qualities involved in explaining K-factor

b. For the purpose of assigning a numerical value to a subjective assessment, we can say that for a K-factor of 5 percent, picture impairment is noticeable to an experienced and critical observer, whereas a K factor equal to or less than the limits specified is not noticeable.

(1) In Figure 3-15, along the positive base of the transition, for h.a.d. = 0.250 microseconds the time from $t = 0$ to $t = T$ is 0.125 microseconds (A in Figure 3-15). Then the time to $8T$ is $8 \times 0.125 =$ microseconds. When h.a.d. = 0.125 microseconds $T = 0.0625$ microseconds (B in Figure 3-15). Therefore, $8T = 8 \times 0.0625 = 0.5$ microseconds. Obviously, the transition along the negative time base is the same, but progresses in the opposite direction from $t = 0$.

Figure 3-15. Pulse transition along positive time base

(2) Look at Figure 3-16, at plus and minus $8T$, lines representing the limits of the K-factor are spaced in reference to the amplitude at $t = 0$. If the K-factor limit is to be 4 percent, then at the $8T$ points the lines are spaced plus and minus 4 percent of the amplitude at $t = 0$. Echos of larger amplitudes may occur closer to the main transition with no increase in subjective picture impairment. Note, for example, that at $2T$ the limit increases to 4 times that at $8T$. Thus, if the $8T$ point has a K-factor of 4 percent, the $2T$ point is allowed an amplitude of $4 \times 4 = 16$ percent to fit within the 4 percent K-factor mask. Note also that the same mask can be used for pulses of either 0.025 microseconds or 0.125 microseconds h.a.d. by proper adjustment of the waveform monitor time base. The time base of $0.250\text{H/cm} \times 25$ is the proper time base for the pulse with h.a.d. of 0.250 microseconds. For the pulse with h.a.d. of 0.125 microseconds, $0.125\text{H/cm} \times 25$ is the proper time base.

Figure 3-16. Basic K-factor

c. The K-factor graticule includes the limits of flatness for the window signal and the limits for the pulse-to-bar amplitude measurements for the K-factor used. Figure 3-17, which indicates how these limit lines are established. Observe, also, in this drawing that an indicator is used to show the correct waveform centering to place the leading edge of the window signal.

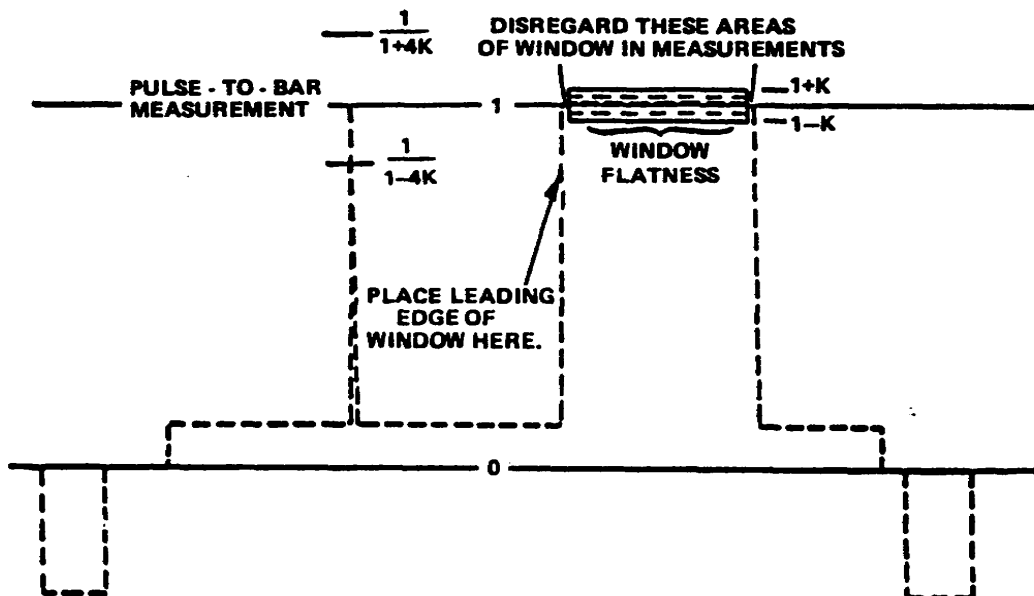

Figure 3-17. Pulse and window K-factor limits

d. Note that an area of either side of the window is disregarded in this measurement, and that only the enclosed area along the top of the bar is used. This is true for either horizontal or the vertical rate waveform displays.

4. Figure 3-18 illustrates the basic T-pulse responses encountered.

a. In Figure 3-18a, an amplitude-response error is apparent without phase-response error. Waveform errors this close to the transition do not impair the signal as much as errors farther away. In fact, this type of error should be recognized as that obtained from "phaseless aperture correction" in camera chains. Thus, there is a "crispening" effect of a single overshoot as compared with the actual picture impairments such as would result from the remaining waveforms of Figure 3-18.

b. Figure 3-18b, shows the "skew symmetrical" distortion caused when the delay increases with increasing frequency. Figure 3-18c, shows the opposite type of phase distortion, where the delay decreases with increasing frequency. In a system with a fairly rapid rolloff that uses phase equalizers to correct the resulting phase distortion, proper equalizer adjustment is indicated when ringing amplitudes are equally distributed preceding and following the pulse as shown in Figure 3-18d.

c. The amplitude-frequency and amplitude-phase response at frequencies higher than about 100 kHz is most evident in the measurement of the sin2 pulse. Amplitude-phase response at frequencies below 100 kHz is most evident in measurement of the window signal.

5. Distortions. Distortions at low frequencies produce waveform distortion with a long time constant, as for example, streaking. This is most evident in window measurement. Distortions at higher frequencies produce waveform distortions with shorter time constants as, example, smearing, loss of resolution, or edge effects from bad transient response. This is most evident in sin2 pulse measurement or in window-signal transitions.

a. High-frequency rolloff results in loss of amplitude. Loss of amplitude results in a widening of the pulse, since the area of the pulse represents a constant DC component. A slow rolloff within the video band produces a large reduction in amplitude (and pulse-width increase) with little or no ringing. A rapid rolloff close to the top of the band but still within the desired video bandwidth produces both a reduction in amplitude, and ringing. A rapid rolloff just above the video bandwidth concerned results in practically no effect on amplitude, but does not produce ringing. The shape of the rolloff and whether the resulting phase shift is leading or lagging is revealed by the distribution of ringing before and after the pulse.

**(A) AMPLITUDE-RESPONSE ERROR,
NO PHASE ERROR**

**(B) SKEW SYMMETRICAL DISTORTION
HIGH FREQUENCIES.**

**(C) SKEW SYMMETRICAL DISTORTION
HIGH FREQUENCIES LEADING**

(D) USUAL EFFECT OF PHASE EQUALIZERS

Figure 3-18. Basic T-pulse

b. The window permits detecting low-frequency distortion, which has practically no effect on the sin2 pulse. The window shows undershoot, overshoot, and horizontal tilt, depending on the time constant of the impairment. When used with the sin2 pulse, the window has the same rise time as the pulse so that no frequencies higher than the system test reference are introduced.

6. Ringing.

a. Ringing occurs at the frequency at which the gain dip occurs in the system being measured. The ringing amplitude depends on the sharpness of this gain-dip characteristic.

b. The ringing period (fig 3-19) is defined by the following relationship:

$$R_p = 1/f_c$$

where f_c is the cutoff frequency.

For example, if we have a 4-MHz cutoff, the ringing period (R_p) is:

$$R_p = 1/4(10 \text{ to the 6th power}) = 0.250 \text{ microseconds}$$

To find the cutoff frequency for a given measured ringing period:

$$f_c = 1/R_p$$

where f_c is the cutoff frequency in megahertz, R_p is the ringing period in microseconds.

Figure 3-19. Ringing period

7. Waveform Distortion. Certain terminology is becoming standard, when defining waveform distortion, and following is a brief review of this terminology.

a. Short-time Waveform Distortion (SD) involves impairment of small picture detail in the horizontal direction. It is seen

as blurring or smearing of a sharp brightness transition. It may or may not be accompanied by an overshoot or ringing to the right or left of the transition. Measurement of the SD may be accomplished by observing the leading and trailing edge of the window signal displayed at the horizontal rate; the display may be expanded on the scope time base.

b. Line-time Waveform Distortion (LD) concerns a longer time constant than does SD, and it results in impairment of brightness reproduction between the sides of a picture detail. When detail is smaller than full picture height, the streaking is most noticeable to the right of the detail. Details extending all the way up and down the picture may result in streaking across the full raster horizontally. Measurement of LD is done across the top of the window signal viewed at a horizontal rate, and by the relationship of the leading and trailing edges to reference black.

(1) In one type of LD, (fig 3-20) positive streaking is indicated preceding the window (black-after-black) and following the window (white-after-white) on the raster. Note the blacker-than-black tilt prior to the window, and the time duration required to fall to black at the trailing edge of the window. In actual measurement, the 1 microsecond intervals at the leading and trailing edges are not used, and the same durations for a and b relative to A are used. The window is approximately $1/2H$ in duration, and the time from the trailing edge of the window to the leading edge of sync is about $1/4H$. So one-half of the window tilt is included in the (a) measurement, as indicated on the drawing.

Figure 3-20. LD with leading and trailing positive streaking

(2) If the type of distortion is strictly linear, dimensions a and b are equal. If nonlinear distortion is present, these dimensions may differ. If reducing the level of the test signal into the system changes the relative dimensions of a and b, nonlinear distortion is present, and a lower level of test signal input should be used to check the actual linear distortion.

(3) Using the vertical-rate CRO display of the same signal, the white-going setup between the bottom of the white signal and blanking serves as an accurate indicator of the percentage of distortion. This defect is the result of excessive gain at low frequencies and causes an increase in setup level, in addition to the streaking effect from the attendant low-frequency phase shift. Such distortion is usually the result of a defective equalizer on long lines, or overcompensation with low-frequency compensation controls or tilt controls.

(4) LD resulting in negative streaking (black-after-white) impairs the display of lettering. The vertical-rate display indicates clearly the loss of setup, which occurs because this type of phase distortion is the result of insufficient gain at low frequencies, up to about the tenth harmonic of the nominal linescanning frequency of 15,750 Hz. In practice, the loss of gain occurs below the first few harmonics, or approximately 50 kHz.

8. Field-time Waveform Distortion (FD) results in impairment of brightness reproduction from top to bottom of the picture. Measurement of FD is done across the top of the window signal viewed at the vertical rate, and by the relationship of the leading and trailing edge of reference black.

9. Relative Chroma Level (RCL) is a measure of the faithfulness of reproduction of the saturation of all colors in a color picture. High RCL causes more vivid colors than intended; low RCL causes colors more pale than intended. Measurement of RCL is done most readily with the modulated 20T pulse.

10. Relative Chroma Time (RCT) is a measure of relative chroma and luminance delay. The results of RCT errors is misregistration of all colors with their respective luminance components. Delayed RCT places chroma to the right of its luminance component; advanced RCT places chroma to the left. Measurement of RCT is done with the modulated 20T pulse.

11. Modulated 20T Pulse. The modulated 20T pulse is the most convenient method of displaying RCL and RCT. Figure 3-21 typifies the display when pure amplitude distortion exists (no phase distortion). A change in amplitude of the 3.58-MHz subcarrier results in a cosine-shaped distortion of the base line, and a departure from reference peak level (top of window signal). When the distortion is linear, dimensions d1 and d2 are equal. If these dimension are unequal, nonlinear distortion (differential gain) is present. In this case, linear distortion normally can

be measured by reducing the test signal input to one-half the normal input level, or about 0.5 volts peak to peak.

Figure 3-21. RCL only, no phase distortion

a. Dimension p (fig 3-21) represents the peak-to-peak level of the 3.58-MHz signal. Therefore (assuming $d1$ and $d2$ are equal), $RCL = p$. Thus, assuming p is 80 percent, RCL is 80 percent, or simply 0.8.

b. Figure 3-22 typifies RCT (without amplitude distortion). The envelope of the line 3.58MHz subcarrier has a sinusoidal baseline distortion indicating a delay (fig 3-22A). The sinusoidal base-line distortion indicates an advance (fig 3-22B). Although dimension d can be expressed as a percentage of A , the scope display does not provide a very convenient method of specifying the actual group delay in nanoseconds. The maintenance technician normally is interested only in the fact that he has a delayed-chroma or advanced-chroma problem, not in the measurement of actual delay. When this measurement must be determined, a calibrated variable chroma delay or advance is used at the generator output and is adjusted for a flat base line. The degree of RCT (delay or advance) can then be read directly from the calibrated dial in nanoseconds. Otherwise, RCT may be specified in terms of whether chroma is delayed or advanced, and the percentage of d to A .

c. It is often the case that RCL and RCT distortion occur simultaneously. Figure 3-23 represents typical displays. The figure is self-explanatory if the preceding two figures are understood.

Figure 3-22. RCT only, no amplitude distortion

Figure 3-23. RCL and RCT simultaneously

Lesson 3
PRACTICE EXERCISE

1. What are the burst frequencies of the multiburst signal?
 - a. 0.15, 0.5, 1, 2, 3, & 3.58 MHz
 - b. 0.5, 1.5, 2.5, 3, 3.58, & 4 MHz
 - c. 0.15, 0.5, 1.5, 3, 3.58, & 4.2 MHz
 - d. 0.5, 1.5, 2, 3, 3.58, & 4.2 MHz
2. How many steps are used in gray-scale linearity signal?
 - a. Four
 - b. Six
 - c. Eight
 - d. Ten
3. How many horizontal lines are contained in the vertical synchronization interval?
 - a. 17-18 lines
 - b. 18-19 lines
 - c. 19-20 lines
 - d. 20-21 lines
4. What is the peak chrominance amplitude for the VIRS?
 - a. 40 IRE
 - b. 60 IRE
 - c. 75 IRE
 - d. 90 IRE
5. What type of test signal measurement is used to correlate the actual degree of picture impairment?
 - a. B-factor
 - b. E-factor
 - c. K-factor
 - d. Q-factor
6. What involves impairment of small picture detail in the horizontal direction?
 - a. Line-time waveform distortion
 - b. Field-time waveform distortion
 - c. Short-time waveform distortion

OCTOBER 2000

FM 3-61.1

Public Affairs Tactics, Techniques and Procedures

DISTRIBUTION RESTRICTION:

Approved for public release; distribution is unlimited

**HEADQUARTERS,
DEPARTMENT OF THE ARMY**

Preface

The mission of Army Public Affairs (PA) is to fulfill the Army's obligation to keep the American people and the Army informed, and to help establish the conditions that lead to confidence in America's Army and its readiness to conduct operations in peacetime, conflict and war. PA is a critical battlefield function in today's global information environment since every aspect of an Army operation is subject to instantaneous scrutiny.

This field manual (FM) sets forth tactics, techniques and procedures (TTPs) for conducting PA operations in accordance with the doctrinal principles contained in FM 3-0 (100-5), *Operations* and FM 3-61 (46-1), *Public Affairs Operations*. Although this manual is primarily designed to be used by public affairs officers, noncommissioned officers and civilians, it presents TTPs that all leaders conducting operations in the information age should be familiar with.

FM 3-61-1 (46-1-1) is applicable to units and individuals in both the active and reserve components. It serves as a foundation for integrating PA into Army doctrine, training, leader development, organization, materiel and soldier initiatives. In conjunction with the Army Training and Evaluation Program (ARTEP) and other training guidance, it should also be used to plan, integrate and execute individual and collective PA training in units throughout the Army.

The proponent for this manual is the Office of the Chief of Public Affairs. Send comments and recommendations on DA Form 2028 to Director, Army Public Affairs Center, ATTN: SAPA-PA, Fort Meade, MD 20755-5650.

Unless this publication states otherwise, masculine nouns or pronouns do not refer exclusively to men.

This document is approved for public release; distribution is unlimited.

Introduction

With the extremely sophisticated communication technologies of the global information environment (GIE), the nature of media coverage has a significant impact on the conduct of war and stability and support operations at the strategic, operational and tactical levels. Civilian and military news media coverage influences the perceptions of soldiers, family members, the public and political leaders, and affects the direction, range and duration of operations. It has a direct relation to the confidence these key audiences have in the Army and its execution of operations.

Effective PA operations are critical to successful Army operations in the information age. They assist the commander in monitoring and understanding public opinion, explaining the situational context of events and communicating the Army's perspective clearly and without filters. They enable the commander to interpret the perceptions of external and internal audiences and influence the way in which discussion of the operation is framed.

Synchronized, well-planned and actively executed PA tactics, techniques and procedures significantly clear the fog of war and impact the morale and effectiveness of the force. They reduce distractions, misinformation, uncertainty, confusion and other factors that cause stress and undermine efficient operations. They enhance understanding, acceptance and support. Effective PA operations contribute to soldier confidence, discipline, will to win, and unit cohesion.

FM 3-61-1 (46-1-1), *Public Affairs Tactics, Techniques and Procedures*, builds on the doctrinal foundation of FM 46-1. It translates the PA fundamentals and principles into detailed guidance for the planning, coordination and execution of PA operations. It provides what is required for the information age -- a sophisticated approach to conducting PA operations. It is the TTP that brings Army Public Affairs into the "information age."

FM 3-61 (46-1), *Public Affairs Operations*, addresses fundamental PA concepts in depth, and provides the linkage between PA and the Army's keystone doctrine, FM 3-0 (100-5), *Operations*. It recognizes that a refocused, restructured military will conduct operations in an information environment in which detailed, graphic, and live coverage of events are transmitted around the world. It builds from the understanding that information availability will influence strategic decisions and the direction, range and duration of operations.

FM 3-61 (46-1) also examines PA operations at the different levels of war and across the range of operations. It discusses PA operations with respect to the Principles of War and the Tenets of Army Operations. It analyzes the PA contributions to build and sustain combat power, defines the PA mission, and establishes strategic PA goals, fundamental PA principles, and underlying considerations for planning integrated information strategies.

Public affairs frequently deals in intangibles -- perceptions and implications -- that are not easily quantifiable or qualifiable, but are essential to commanders. The PA objectives, processes and methods presented in FM 3-61-1 (46-1-1) will assist Army leaders and PA professionals to develop solutions to the complex PA issues they will confront.

Chapter 1

Public Affairs Fundamentals

Public Affairs fulfills the Army's obligation to keep the American people and the Army informed and helps establish the conditions that lead to confidence in America's Army and its readiness to conduct operations in peacetime, conflict and war.

FM 3-61 (46-1), Public Affairs Operations

THE PA MISSION

1-1. The American public, internal Army audiences, allies, adversaries and other critical audiences have access to an ever expanding array of public and military media. Newspapers, magazines, radio, television and electronic media are independent conduits of information. They provide news, analysis, interpretation and commentary and serve as a forum for ideas, opinions and public debate. What appears in the media, both civilian and military, shapes perceptions, attitudes and opinions, and can have a direct impact on mission success.

1-2. The vast majority of both civilian and military media representatives are committed to providing responsible, accurate, balanced coverage. Although there are exceptions, most media representatives, even when editorializing, are focused on achieving a credible presentation. To accomplish this, media representatives investigate issues, ask tough, challenging questions, and pursue verifiable answers. They seek information, interpretation and perspective. Army leaders at all levels need to educate media representatives and facilitate their efforts to provide an accurate, balanced and credible presentation of timely information.

1-3. Army leaders do this by integrating public affairs into the planning process and synchronizing PA operations with other facets of the operation. Integrating and synchronizing public affairs issues allows commanders to communicate their perspective and achieve a balanced, accurate, credible information presentation.

1-4. The PA mission identifies the essential contribution that PA makes to America's Army. The mission and the strategic goals derived from it provide the foundation on which public affairs operations are built. Strategies, which are developed from the perspective that every aspect of every operation could become an issue of interest in the global information environment, are the most successful. Developing such strategies requires that PA personnel access, analyze and anticipate potential issues by conducting a thorough mission analysis.

1-5. The challenge for commanders, and personnel supporting them, is to plan and execute operations, which accomplish this mission and support

these goals. To do this, PA must be integrated into the planning and decision-making process from receipt of the mission.

1-6. The need to integrate and synchronize PA early derives from the fact that in most situations media representatives will be present in an area of operations before the arrival of Army forces. They will know the area of operations and because they are covering the story as it evolves, will have an understanding of, and opinion about, the situation.

1-7. Media interest will normally be the most intense at the onset of operations. Media representatives will cover the deployment of Army forces, their arrival in the area and their initial conduct. To support the commander and the force in their interactions with media representatives during these early stages, public affairs personnel should be deployed in the first days, if not hours, of the operation. Dealing with a large international press corps constitutes the most immediate public affairs challenge facing the commander during contingency.

PUBLIC AFFAIRS FORCE

1-8. The changing information environment in which the Army conducts war and stability and support operations makes it necessary for PA officers, NCOs and specialists to respond to increasingly complex, demanding challenges. They must be prepared to support the commander with a wide range of knowledge about and understanding of the communication process, the global information environment (GIE) and its potential impact on operations.

1-9. PA personnel must also thoroughly understand the fundamentals of Army operations and the strategic context within which the Army conducts operations. As the GIE compresses the strategic, operational and tactical levels of operations, PA personnel need to appreciate the linkage between public opinion, political decision-making and the national security strategy. They must understand the Army's approach to fighting, influencing events in operations other than war and deterring actions detrimental to national interests.

1-10. PA leaders must, therefore, be among the most informed people in the command. They must be thoroughly aware of all aspects of the operation. They need to know what is being reported about the operation in the global news media and how internal and external audiences are reacting to that information.

1-11. The Public Affairs Officer. The PAO's primary mission is to assess the PA situation, advise the commander on PA issues, assist him in making the best possible decisions, and translate his decision into effective PA operations. PAOs employ the decision-making process to plan, coordinate and supervise the implementation of a PA strategy that helps the commander meet his obligation to communicate with the American public, soldiers, home station communities and the Department of the Army community. PAOs analyze the situation, anticipate issues, assess implications, and develop comprehensive operations, which meet the news and information needs of internal and external audiences and facilitate media operations.

1-12. The Public Affairs Non-Commissioned Officer. The strength of the Public Affairs functional area is its non-commissioned officer corps. PA NCOs are experts on the global information environment, media operations, information strategies, and PA training. They are integral to all facets of the PA planning and decision-making process and provide the essential functional area expertise and continuity required for successful PA operations.

1-13. PA NCOs work closely with the PAO, and in many situations, a PA NCO is the commander's senior PA advisor. Therefore, PA NCOs are fully prepared to assess the PA situation, develop, synchronize and coordinate a PA strategy, implement and monitor PA operations, and measure and evaluate the success of the PA effort.

1-14. The Public Affairs Specialist. In addition to learning traditional soldier skills, PA specialists are trained to support the entire spectrum of PA operations conducted in the global information environment. They are trained on news media operations, news media facilitation, information strategies and information provision. They register media representatives, gather information, develop information products, support news media briefings, respond to news media inquiries and requests for assistance, and track and monitor news media activities throughout the area of operations. They work with news media representatives to gather accurate information and provide timely, balanced coverage of the operation.

1-15. The Department of the Army Public Affairs Civilian. Civilian PA practitioners assigned to Tables of Distribution and Allowances (TDAs) have the same skills as military PA personnel. They provide critical support during war and non-combat operations by providing a vital link between deployed forces and the home station community, and in many situations, may be called upon to deploy with the units they support, or as individual augmentees.

PUBLIC AFFAIRS ELEMENTS

1-16. Battlefield commanders have two sources for tactical PA support. The first is the PA section organic to a warfighting headquarters. The second is the PA unit, which is attached to a headquarters to augment the command's PA capability.

1-17. Conducting PA planning, facilitating news media operations on the battlefield, providing news and information, and executing PA training and support operations is manpower intensive. The austere staffed PA sections organic to warfighting headquarters will nearly always be overwhelmed trying to meet PA requirements in war and other operations. PA staff sections, therefore, rely on early augmentation by PA units, or individual augmentation if appropriate, to accomplish the battlefield PA mission.

1-18. **Organic Public Affairs Sections.** Organic PA sections are found in warfighting headquarters at various levels including brigades, divisions and corps throughout the Army. Army PA personnel are also assigned to the organic PA sections of joint and combined headquarters.

1-19. In headquarters without organic PA sections, the commander is responsible for PA and must plan and execute PA operations or assign responsibility for PA operations as a special or additional duty to an officer or senior NCO in the command.

1-20. Regardless of the echelon, the PA staff section's primary responsibility is to assist the commander in accomplishing his mission. The staff:

- provides PA information expertise and advice
- conducts PA assessments
- provides analysis of the information environment
- conducts PA planning
- develops information strategies and guidance
- implements PA operations
- measures the effectiveness of the PA effort
- conducts PA training

1-21. The PA staff element controls augmenting PA units. It determines requirements, defines priorities and assigns missions to the augmenting unit. In conjunction with the augmenting unit commander, the staff element task organizes the unit, allocating personnel and equipment to accomplish objectives. If the PA staff element is a Public Affairs Operations Center or a Task Force Headquarters, it will coordinate Armed Forces Radio and Television Service (AFRTS) support activities for the command.

1-22. **Public Affairs Units.** PA units are fully deployable TOE organizations designed to augment the PA staff sections of warfighting units, although they can operate independently in certain limited situations. When a PA unit is deployed to augment a PA staff section, the personnel in the unit cannot be reassigned as replacements or employed as individual fillers for other public affairs elements.

1-23. PA units depend upon the unit they augment for personnel administration, finance, legal and health services, communications, food service, unit maintenance, and supplemental transportation support. PA units operating at corps and below must have the capability to transport all of their TOE equipment in a single lift using authorized organic vehicles.

1-24. There are currently four types of PA units:

- Public Affairs Detachment (PAD)
- Mobile Public Affairs Detachment (MPAD)
- Public Affairs Operations Center (PAOC)
- Broadcast Operations Detachment (BOD)

1-25. **Public Affairs Detachment (SRC 45500AA00).** The smallest of the PA units, the Public Affairs Detachment (PAD) (Figure 1-1) is commanded by a captain and includes seven PA soldiers..

Public Affairs Detachment

BR JOURN	PFC	46R

Figure 1-1. PAD

1-26. The PAD normally augments a division, separate brigade and armored cavalry regiments and deploys in support of combined, unified or joint operations.

1-27. The PAD commander assumes responsibilities as the PAO or deputy PAO, and the PAD PA personnel are integrated into the supported command's PA section based on operational requirements.

Historical Perspective

The 10th Mountain Division, Fort Drum, N.Y., arrived in Somalia with hundreds of reporters already there, and absolutely no public affairs personnel accompanying them. The first public affairs support arrived at the 2nd Brigade, 10th Mountain Division, 10 days later and only because the JIB dispatched one of its own PADs.

(PA After Action Report, Operation Restore Hope, 10th Mountain Division, Dec 1992)

1-28. Because of the size of the unit, the PAD provides limited:

- Personnel and equipment for digital imagery and audio acquisition.
- Personnel for media escort within the supported unit's area of operations
- Coordination of an information product distribution system that can relay news and information products to members of the supported unit, higher echelons and home station.
- Planning, developing and implementing strategy to support civilian news media and facilitate news gathering efforts throughout the supported unit's area of operations
- Personnel and equipment to coordinate, assist or conduct press conferences and briefings

- Personnel to train, advise and assist leaders and soldiers interacting with or supporting civilian news media within the supported unit's area of operations.

1-29. **Mobile Public Affairs Detachment (SRC 45413A000).** The workhorse of PA units, the Mobile Public Affairs Detachment (MPAD) is a modular, task organizable unit, which provides the full range of PA services. (Figure 1-2). The MPAD is commanded by a major and includes 20 soldiers.

Figure 1-2. MPAD

1-30. The MPAD normally augments a Corps PA section or a Public Affairs Operations Center (PAOC). In support of a PAOC, it provides manpower and equipment to establish and operate a media center at Theater Army, TAACOM and Corps.

1-31. It may also be deployed to directly support a joint service task force or non-DoD governmental agency conducting disaster relief, humanitarian assistance, counter drug, peacekeeping, or other contingency operations.

1-32. MPADs in direct support of a gaining command PAO provide acquisition capability for print, audio and video.

1-33. Additional MPADs in direct support can expand the media escort capability of the supported PAO, augment divisions and other elements in theater and provide the PAO with staff augmentation. MPADs may be deployed forward to establish media centers or a sub-JIB in a joint environment.

1-34. MPADs have the capability to:

- Monitor and assess the perceptions of external audiences through access to civilian commercial news sources.
- Conduct assessments of the information environment, to include development of a PA estimate of the situation, as the initial part of operational planning.
- Assist the PAO in operational planning and policy and ground rules for media, coordination for logistical support to PA, and coordination of PA operations with higher and subordinate headquarters.
- Plan and develop information products, which will be produced through contracted services and/or the use of organic equipment and facilities.
- Acquire, produce and transmit information products throughout the theater, between the theater and home station, and between the theater and HQDA.
- Create and disseminate print, photographic, audio and video products for external release directly to civilian media who do not have representatives within the theater of operations. Conduct media facilitation and develop information strategies.
- Prepare commanders, staff personnel and other command members for interviews, press conferences, and similar media interaction.

1-35. **Public Affairs Operations Center (SRC 45423A000).** The Public Affairs Operations Center (PAOC) consists of command, media facilitation and post-production sections (Figure 1-3). It is commanded by a lieutenant colonel and includes 32 soldiers.

1-36. The PAOC normally augments the PA staff section at echelons above division to establish and operate a media center in support of civilian and military media representatives working in the theater.

1-37. The PAOC commander serves as the media center commander but works under the control of the PAO of the supported unit or task force.

1-38. In joint or combined operations, a PAOC serves as the Army element of the joint media operations center.

1-39. When the PAOC functions as the Army element of a joint or combined media center, the PAOC commander works for the joint or combined media center commander.

1-40. For major operations in which there is a significant media interest, the PAOC is augmented by up to three MPADs. The MPADs are either integrated into the main media center operation or tasked to operate subordinate media centers at outlying locations. A PAOC can support up to 100 news media representatives. When augmented by three MPADs, the PAOC can support up to 300 news media representatives.

1-41. PAOCs are modular, task organizable units having the capability to:

- Implement the theater or corps strategy to support civilian news media and facilitate news gathering efforts in theater.
- Coordinate and provide services to registered civilian news media sponsored by the command.

- Provide the personnel and equipment to coordinate and conduct media support within the theater of operations.
- Provide personnel and equipment to plan and conduct daily news media briefings.
- Provide personnel to train, advise and assist leaders and soldiers interacting with or supporting civilian news media representatives.

1-42. **Broadcast Operations Detachment (SRC 45607A00).** The BOD consists of a command element, two broadcast teams and a maintenance team. (Figure 1-4). It is commanded by a major and includes 26 soldiers.

1-43. The BOD augments a fixed or field expedient AFRTS facility under the control of a senior AFRTS facility commander, or it can establish and operate a separate radio and/or television broadcast facility to support theater level operations.

Figure 1-4. BOD

1-44. The BODs must be authorized and equipped by AFRTS to perform this mission. When deployed to perform this mission, the BODs are assigned to the PAOC supporting the command.

1-45. BODs have the capability to:

- Provide on-air broadcasters recorded materials and satellite down links to operate a 24-hour a day radio outlet.

- Provide on-air broadcasters, recorded materials and satellite down links to operate a television station.
- Originate audio and video news, feature and entertainment programming from within theater.
- Provide post production services for audio and video news and feature material supplied in unedited format.
- Provide limited audio and video materials to other public affairs operations for dissemination outside the theater.
- Acquire audio and video electronic newsgathering coverage of operations in the theater for use in internal and external information programs.
- Perform field maintenance and repair above operator level to broadcast equipment organic to the unit.
- Provide the commander with an alternate means of communications when tactical communications are not adequate or not available.

1-46. Public Affairs organizations are built around a force of soldiers who are selected and trained to articulate the goals and missions of the Army.

1-47. More than 65 percent of the total public affairs force and 85 percent of the deployable TOE unit structure is positioned in the U.S. Army Reserve and Army National Guard. These reserve units and personnel must be seamlessly integrated with the active component and focused on supporting the overall Army goals and objectives.

Chapter 2

Public Affairs Functions and Responsibilities

THE CHALLENGE

2-1. The global information environment and continually evolving information communication technologies make it imperative that information and messages be consistent at all levels. The personal comments made by a deployed soldier in a remote area of operations and the official statements released by DoD at the Pentagon must be mutually supporting. The information targeted to internal audiences must parallel the information released through the news media to the American public and other external audiences. The Army's need for security, and the soldier's and family member's right to privacy must be balanced with the Army's obligation to provide timely, accurate, complete information to internal and external audiences. The commander's information strategy must ensure that the information available in the public domain, regardless of the source, does not conflict, contradict or otherwise undermine the credibility of the command or the operation.

Historical Perspective

Civilian news coverage contributed greatly to maintaining soldier morale during Desert Storm. The coverage was generally positive; the American people were behind the operation and soldiers felt this impact. Problems arose when the coverage created rumors, and command information was not consistent with what the soldiers were seeing or hearing in the world media. Family members and non-deployed soldiers were greatly affected by news coverage, often creating problems for rear commanders and detracting from their credibility.

(After Action Report, Desert Storm 1990, Center for Army Lessons Learned)

2-2. Accomplishing this presents unique command and control challenges for commanders, PA practitioners at all levels and others involved in using information to help accomplish the mission in the most effective, efficient manner. It requires careful coordination between staff elements and necessitates continual liaison between levels of command from the tactical through the operational to the strategic.

2-3. Further complicating PA command and control challenges are PA force structure realities. The small size of the PA staff sections organic to war-fighting headquarters necessitates augmentation, especially for operations with a high level of visibility. The availability of augmenting PA units, the majority of which are located in the reserve components, and the difficulties inherent in deploying PA civilians result in heavy dependence on

augmentation by individuals. This leads to the creation of ad hoc, unequipped PA elements, which have not trained together or developed relationships with other staff sections or commands, and do not have established internal or external operating procedures.

2-4. For PA personnel therefore, the critical challenge is to rapidly define command and control channels, establish lines of communication and develop operating procedures. The responsibility for doing this usually lies with the Corps PAO who normally leads the commander's PA effort. He identifies requirements, assesses resources and plans, organizes, directs, coordinates and controls the PA operation.

PUBLIC AFFAIRS RESPONSIBILITIES

2-5. Effective PA command and control establishes a public affairs organization based on analysis of mission, enemy, terrain, troops, time available and civilians (METT-TC), tailored to the situation, which reflects the commander's concept of the operation. It ensures that there are sufficient, experienced, PA personnel at each echelon to provide the commander and his force with the most effective and efficient support possible.

2-6. PA command and control begins at the DoD level. The Office of the Assistant to the Secretary of Defense, Public Affairs (OASD(PA)), retains primary responsibility for the development and consistent implementation of DoD information policies and determines who should serve as the initial source of information about operations. Although (OASD(PA)) delegates PA release authority to the combatant commander as soon as practical, it retains responsibility for approving Public Affairs Guidance (PAG), establishes public affairs policy, and coordinates and approves PA strategies and plans.

2-7. The Office of the Chief of Public Affairs (OCPA) for the Army is responsible for Army PA resources. OCPA develops PA doctrine, designs PA organizations, determines training and leader development requirements, identifies materiel needs, and manages PA personnel to ensure that sufficient assets are available, qualified and ready to conduct successful PA operations in support of any assigned mission.

2-8. Commanders supported by their PA staff personnel, plan PA operations for their assigned missions based on the situation, published in DoD directives, instructions, doctrine and guidance, and in coordination with OASD(PA). The CINCs prescribe the chain of command, organize and employ forces, give authoritative direction, assign tasks and designate objectives through component commanders, subordinate unified commanders, commanders of joint task forces and other subordinate commanders. The commander establishes responsive PA structures and ensures that they are provided with the personnel, facilities, equipment, transportation and communications assets necessary to provide adequate PA support. A failure to establish these structures results in a duplication of effort and a waste of resources. The commander is responsible for the full range of PA activities -- PA planning, media facilitation, information strategies and PA training and at sustaining base, community relations. He is also responsible for establishing, resourcing and guiding the operations of Joint Media Operation

Centers and planning all AFRTS radio and television support operations in the area of operations.

Historical Perspective

The establishment of the Joint Information Center under the auspices of the DOT Presidential Task Force on September 1, 1992 was vital to a coordinated and successful Joint Public Affairs effort. The JIC was an “umbrella” organization that served as the clearing house for dissemination of hurricane relief information to the news media. More than 10 federal agencies involved in relief operations had public affairs representatives at the JIC. Daily meetings and consistent interaction among the agencies involved resulted in a coordinated federal information effort.

(Public Affairs Lessons Learned Library, Joint Information Center, Hurricane Andrew, 1992)

2-9. Within the Army, the Corps is usually the hub for PA operations. The Corps commander, supported by his PA staff element, is responsible for the development and coordination of PA strategies, the implementation of information campaigns and the execution of PA operations based on METT-TC, the information environment, and guidance and policy received from the combatant CINC.

2-10. The Corps PAO is the principal PA advisor to the Corps commander and deploys with the lead element of the Corps headquarters. When fully deployed, the Corps PAO section operates from the Corps main command post, with a liaison officer/NCO located at the Corps plans cell. It also is responsible for establishing coordination with the PA elements of higher, lower and adjacent commands.

2-11. The Corps, through the PAO, controls the employment of augmenting Army PA units deployed in support of the operation. Up to one PAOC and six MPADs are normally allocated to augment the Corps PA section, although the size and scope of the mission will determine the actual augmentation required for each operation. The Corps PAO and his staff task organize the personnel and organizations available and allocate the equipment, communications support and facilities. When augmented, the Corps PAO operates a media operations center and establishes satellite centers as required.

2-12. Below the Corps level, the PA staff section organic to a war fighting headquarters is extremely austere. The mission of the PA section below Corps is to advise the commander by providing immediate planning expertise and guidance on issues with critical PA implications. The PA section deploys with the lead elements of the headquarters, and operates from the command's main CP.

2-13. PA units deployed to augment the staff sections organic to a headquarters are normally placed under the control of the supported PAO, who assigns the augmenting PA unit missions and tasks. He will do so in conjunction with the augmenting PA unit commander, who will retain command of his unit and ensure that his unit's personnel are not employed as

individual fillers. Whenever possible, augmenting PA units should be linked with the supported command headquarters at that command's home station prior to deployment to facilitate establishment of command and control relationships.

PUBLIC AFFAIRS COMMUNICATIONS

2-14. Reliable, survivable, flexible communications are essential for effective PA command and control. In today's global information environment, information must flow to and from users, up and down the chain of command, and horizontally across the battlefield. Technology has compressed time and space and forward-deployed PA sections can be in direct communication with officials at DoD working PA strategies. The challenge is to ensure coordination and interoperability so that all elements have the communications capability necessary to effectively carry out their assigned mission, especially in today's joint, combined or interagency environment.

2-15. Deliberate, detailed planning can prevent communications shortfalls. PA planners assess their information transmission and reception needs and requirements. They then identify the communications capabilities they need access to, and determine the communications support they will need from command signal organizations. Through close coordination with the staff signal section, the identified PA communications requirements are integrated into the overall communication architecture.

INFORMATION OPERATIONS

2-16. The three central defining characteristics of the global information environment -- the facility of information acquisition and transmission, the speed of information communication and the breadth of information saturation -- combine to increase information availability. The American public, internal audiences, allies and adversaries have ready access to information. Information security is transitory and it is critical that information operations at every echelon are mutually supporting and directed at a clearly defined, decisive and attainable objective.

2-17. Credibility is essential for successful information operations. If an information source is not perceived as believable, then the desired effect of that communication cannot be achieved. Regardless of the source, target or objective of an information effort, in the GIE, credibility is founded in truth and enhanced by validation, corroboration, and consistency.

2-18. Commanders require integrated, coordinated, synchronized information operations. PA operations, which occur at, and impact on, the strategic, operational and tactical levels -- often simultaneously -- are a critical element of these operations. News media coverage of conflicting messages and information communicated by different elements of the command compromises credibility.

2-19. Integrating, coordinating and synchronizing every element of the commander's information operation -- Public Affairs, Psychological Operations, Civil Affairs, Combat Camera, Operations Security and others -- results in a synergistic information strategy. It minimizes the possibility of conflicting messages, which undermine credibility, jeopardize operations and endanger mission accomplishment.

LOGISTICS SUPPORT

2-20. Logistics is critical at all levels of command for Public Affairs mission success, during any phase of combat or garrison operations. Commanders must ensure their Joint Table of Allowances (JTA), Modified Table of Equipment (MTOE), Table of Distribution and Allowances (TDA) or Common Table of Allowances (CTA) reflects appropriate equipment levels to maintain a PA staff and media support under field and garrison conditions. Maintenance also plays an important role in Public Affairs operations. A Public Affairs element that has all its equipment cannot function properly if its equipment is inoperative, broken or deadlined. Each Public Affairs element must develop its own internal SOP in regard to logistics. (See Appendix K.)

2-21. Public Affairs staff members must be trained in the areas of supply, budget, property book, ordering, class A procurement, etc. Public Affairs must be an integral player in all mission and operational planning sessions to ensure logistical requirements are identified and resourced.

2-22. Responsibilities: The Public Affairs staff has the responsibility to identify to its resource manager, property book manager and ordering officer all fiscal and logistical requirements for field operations and home station support. Requisitions for equipment, supplies, services and allowances will be ordered and processed in accordance with appropriate Army Regulations, AR 710-2 *Unit Supply Update* and budgetary guidelines.

2-23. Requesting supplies: Commanders must ensure that equipment and components authorized by JTAs, CTAs, MTOEs, or TDAs are on hand or requested. The organization's supply operation is responsible for identifying, acquiring, accounting, controlling, storing and properly disposing of materiel authorized to conduct the mission of the unit and maintain the soldier. The organization is the foundation of the supply system. Exceptions and procedures are outlined in AR 710-2.

2-24. The Direct Support and General Support Activities provide class 1, 2, 3 (packaged and bulk), 4, 5, 7, 8 and 9 supplies directly to the using units on a customer support basis. These supplies are routinely procured through the unit supply rooms. In the event a Public Affairs element is operationally attached outside its assigned organization, it should coordinate before deployment for logistical support when possible. If prior coordination is not possible, contact for support should be made upon arrival into the theater of operations through the C-4, J-4, G-4, or S-4.

2-25. Accountability: All property acquired by the Army, regardless of source or whether paid for or not, must be accounted for, in accordance with applicable Army regulations and AR 710-2.

- Nonexpendable property is personal property that is consumed in use and that retains its original identity during the period of use. It requires formal property book accountability throughout the life of the item. It will be accounted for at the using unit level using property book procedures. Examples are desks, computers, file cabinets, chairs.
- Expendable items are property which is consumed in use or that loses its identity in use, and all items not consumed in use with a unit price

of less than \$100 and not otherwise classified as nonexpendable or durable. It requires no formal accounting after issue to the user. The following classes or types of property will be classified as expendable.

- Supplies consumed in the maintenance and upkeep of the public service. Examples are oil, paint, fuel and cleaning and preserving materials.
- Supplies that lose their identity when used to repair or complete other items. Examples are assemblies, repair parts, and accessories.
- Office supplies and equipment (such as paper, staplers and hole punchers) with a unit price of less than \$100.
- Durable property is personal property that is not consumed in use, does not require property book accountability, but because of its unique characteristics requires hand receipt control when issued to the user. Examples are hammers, lawnmowers, audiovisual production material and books.

2-26. Conservation of resources and property accountability is ultimately a supervisory responsibility. Property responsibility must be assigned and acknowledged in writing using hand receipts and property books as outlined in AR 735-5, *Policies and Procedures for Property Accountability* and AR 710-2.

2-27. Property book: Effective supply support at the using element or property book level requires timely and accurate processing of supply requests and receipts, accurate accounting records and adequate property control. Turn in, transfer, substitutions, hand receipt, etc., are accomplished in accordance with Army Regulations, AR 710-2 and logistical SOPs.

2-28. Budget: Budgets must be programmed in advanced. Organizations plan their budget in the previous fiscal year. They must be established and managed with the appropriate command resource manager/budget analyst. When allocating funds consideration must be given to equipment replacement and upgrades, recurring supply needs TDYs, maintenance, contracts, etc. Normal operating funds are allocated/dispersed by a public affairs element operational headquarters; however, during deployments for exercises/operations funds may be available from the tasking headquarters up front or on a recuperative basis.

2-29. Maintenance: Public Affairs elements must maintain their equipment in a deployment ready state. Preventive Maintenance Checks and Services (PMCS) is an important part of the maintenance program, and is the user's responsibility. The Public Affairs element's operational headquarters provides maintenance support. For example, an embedded Public Affairs section assigned to the Headquarters Company of a separate brigade would seek maintenance support from the Headquarters Company, then the brigade maintenance section. The company/brigade's maintenance SOP would be followed for 1st, 2nd, 3rd, etc., echelons of maintenance. Maintenance for communications and data processing (computers) equipment is coordinated through the G6 (DOIM).

2-30. Local Purchase: Local purchases may be an option for procurement provided the action is in the best interest of the government in terms of

timeliness, quality and cost. Local purchase requests must be made in accordance with AR 710-2. Approval for local purchase of nondevelopmental items starts at the first level of command authority and is accomplished in accordance with local policies and Army regulations. Nondevelopmental items is a generic term that covers materiel available from a variety of sources with little or no development effort from the Army. Sources include commercial items which fully meet an approved need, items being used by other U.S. services or agencies or items used by military or other agencies of foreign government. Most of these purchases are covered under the IMPAC Card program. Local guidance covers implementation.

2-31. Class A Procurement/Credit Card: Class A agents and government credit card holders must be identified and trained prior to their ability to accomplish those functions. Training is routinely accomplished at the installation level. Purchases for other than national-stock-numbered items are routinely accomplished using Class A agents and ordering officers, and the U.S. Government Credit Card.

2-32. SSSC: Self Service Supply Centers are managed at the installation or theater level. Users are required to have a valid SSSC account. Accounts are identified by DODAAC or UIC. Subaccounts are authorized IAW AR 710-2. Field resupply centers are often established at divisional-level logistics bases.

2-33. The best means of ensuring supply discipline is to be proactive and not reactive in supply operations. Enforcing compliance with regulations requires constant emphasis.

Chapter 3

Public Affairs Planning

During Operation Just Cause, PA planning and integration were inadequate. Commanders at all levels failed to involve public affairs officers in planning from fear of OPSEC leaks. The results were insufficient PA guidance provided to soldiers, family members and commanders; sometimes miscommunication to and confusion within Army family elements; and misuse of PA assets. A matter of urgent concern was the failure to plan for and use Reserve Component PA assets to relieve the pressure on an already small active PA force so that it could better handle both internal and external communication.

- Public Affairs After Action Report, TRADOC LLC, Phase II, Sept. 90

COMMUNICATING INFORMATION

3-1. Public Affairs operations assist the commander in communicating information and messages about his force and the operation to internal and external audiences. Like other operations, PA operations are conducted to bring about clearly specified, meaningful objectives, which support the commander's intent and contribute to mission success. Those objectives are defined in terms of the effect the PA operations are intended to have on target audiences -- the impact on target audience behavior that is desired -- and are measurable.

3-2. Once PA objectives are defined, PA operations are planned and executed to achieve those objectives. PA operations focus on the communication process -- an on going, dynamic, ever-changing process. The communication process is composed of elements involved in receiving, collecting, analyzing and interpreting data, identifying and analyzing audiences and formulating and transferring messages. This process is used to bring about a specified objective, while measuring and analyzing the outcome and effectiveness of the effort.

3-3. To support the commander's effort to communicate, PA professionals concentrate on five basic functions or core processes — planning, media facilitation, information provision, force training and community relations.

3-4. This chapter focuses on the systematic process for Public Affairs planning and decision-making. It addresses the information environment and the impact of information at the strategic, operational and tactical levels across the range of operations that requires public affairs considerations be totally integrated into the planning and decision-making process. Doing so enables PA personnel to prepare for potential situations, to synchronize efforts with other agencies that manage information communication, and to more successfully influence the coverage, interpretation and understanding of events. It limits the need for reactive, defensive attempts to buy time or control damage.

3-5. PA planning prepared in support of the CINC's theater campaign plan requires a series of decisions related to policy at the national level and the techniques at the tactical level. From policy to techniques, however, basic planning considerations are the same: What should the PA objective accomplish? With what audience? When? How? PA planning must not only be done at all echelons and within national policy but also within the limits of operational plans and capabilities.

TYPES OF PLANS

3-6. The amount of time available significantly influences the planning process. Two different methods of planning are described in the JCS-published Joint Operations Planning and Execution System (JOPES).

3-7. **Deliberate or Peacetime Planning** is the process used when time permits the total participation of commanders and staffs. Development of the plan, coordination among supporting commanders and agencies, reviews by staffs, planning conferences and development of proposed public affairs guidance can take many months. Deliberate or Peacetime Plans are prepared in prescribed formats--the complete operational plan (OPLAN) or the conceptual operational plan (CONPLAN).

3-8. **Time-Sensitive or Crisis Action Planning** (CAP) is conducted in response to crisis where U.S. interests are threatened and a military response is being considered. Crisis Action Planning is carried out in response to specific situations as they occur and that often develop very rapidly.

3-9. It is within the CAP process that established, working relationships between the PAO and operational planning staffs are crucial to the inclusion of PA considerations into OPLANS and OPORDS.

3-10. Both deliberate and crisis action planning are conducted within JOPES. Joint Pub 5-03.2, JOPES Volume II, describes detailed administrative and format requirements for documenting the annexes, appendixes, etc. of operational plans, and conceptual plans, the products of deliberate planning.

3-11. The purpose of JOPES is to bring both deliberate and crisis action planning into a single architecture to reduce the time required to complete deliberate or crisis action planning. This makes the refined results more readily accessible to planners, and makes it a more manageable plan during execution.

3-12. The overall procedures are the same, at all echelons, for both deliberate and crisis action planning.

- Receive and analyze the task to be accomplished
- Review the situation and begin to collect necessary intelligence
- Develop and compare alternative courses of action
- Select the best alternative
- Develop and get approval for its concept
- Prepare a plan
- Document the plan

Operation Just Cause

The basic problem---planning. No discussion concerning use of personnel can proceed without an understanding of the planning problem. Public Affairs in general was not sufficiently planned for by leaders or public affairs officers for Operation Just Cause. PAOs were not given time to plan. Only outstanding unit mission accomplishment, American public support and the hard work of public affairs personnel, prevented major PA failings in Panama. A longer duration and less popular action could have turned into a public affairs disaster.

The SOUTHCOM, XVIII Airborne Corps, and Army Special Operations Command PAOs were not informed that the operation would occur until 17 December and then they were given instructions not to discuss it with key persons on their staff. The 82d PAO did not learn of the operation until 18 December, 7th ID PAO, 19 December and OCPA **one hour** before H hour.

More critical however, was the absence of joint coordination. OASD-PA received a PA plan from SOUTHCOM public affairs in November, but the plan was never coordinated due to worries concerning possible security leaks. The XVIII Airborne Corps PAO indicated that he also knew of the operation in general terms in November but was unable to coordinate planning with the Director of Public Affairs SOUTHCOM. Because the plan was not staffed, OCPA was caught unaware. Divisional public affairs officers all indicated that they were not sufficiently drawn into planning. Some PAOs said they never saw a plan. It is obvious that sufficient public affairs planning did not occur **at any level**.

There was also a ripple effect downward caused by the lack of staffing by the Joint/OASD-PA. In addition, senior leaders at division level and above did not draw PA officers into planning to maximize the limited planning time that was available. Commanders strongly complained about poor balance of coverage in the media, inability to send command information at the same pace as civilian media reporting, and lack of sufficient public affairs guidance; yet senior leaders are reluctant to draw PAOs into the planning process to prevent these problems from occurring. Army leaders must come to grips with this dilemma.

(Public Affairs After Action Report TRADOC Lessons Learned Collection Phase II. Sept 1990)

3-13. An OPLAN is a complete, detailed plan. It includes a description of the concept of operations from the commander's perspective and presents additional annexes provided by various staff sections which identify specific functional area requirements, restrictions, limitations, or considerations. The inclusion of a public affairs annex is essential to successful integration of PA principles and guidance into the OPLAN.

3-14. A CONPLAN is an abbreviated operational plan, which requires considerable expansion or alteration to convert it into an OPLAN or OPORD. Detailed support requirements are not included. The commander determines what annexes will be included to complete the CONPLAN.

3-15. A Public Affairs Estimate is an assessment of a specific mission from a Public Affairs perspective. It is an examination of critical Public Affairs factors, their influence on the planning and execution of operations, and their potential impact on mission success. The senior PAO at each echelon is responsible for consolidating information and preparing the PA Estimate. A sample PA Estimate is included at Appendix C.

3-16. The Public Affairs Annexes to OPLANS or CONPLANS provide the details and instructions necessary to implement Public Affairs media facilitation, news and information provision, and force training operations. It is coordinated with all staff agencies, especially those that significantly impact the information environment -- Psychological Operations, Civil Affairs, Signal, and Military Intelligence -- to ensure that Public Affairs activities are synchronized with other activities.

DELIBERATE PLANNING

3-17. A commander continually faces situations involving uncertainties, questionable or incomplete data, or several possible alternatives. As the primary decision maker, the commander, with the assistance of the staff, must not only decide what to do and how to do it, the commander must also recognize if and when to act. How the commander arrives at a decision is a matter of personal determination. However, superior decisions (those, which offer the best solution, decisively, at precisely the correct time,) result from the commander's thorough, clear, and unemotional analysis of facts and supported assumptions. This is done through the "deliberate planning process."

3-18. To support the commander's decisions and command objectives, the PAO must develop a thorough, clear, comprehensive public affairs strategy. This strategy allows the PA to link public affairs considerations into planning for contingency, future and current operations. With the PA strategy, the PAO defines the public affairs perspective of the operation, and identifies how the Army public affairs involvement in this operation supports strategic goals. It provides the intent for PA operations and the Army approach to meeting the information needs of critical internal and external audiences. It is the framework for defining and developing the PA scheme of operations.

3-19. Based on the PA strategy, PA plans are developed for integration into OPLANS. A PA plan is produced by the operational commander's PAO, and it details the media facilitation, news and information provision, and force training and support procedures which will be employed in support of the operation.

3-20. The first crucial step in fulfilling the PA strategy requires the PA Plans officer/NCO to establish and maintain a routine, ongoing relationship with operational planners within the organization. The PA plan is coordinated with key staff agencies, integrated into the OPLAN as a PA Annex. Synchronization with these other activities ensures services and support required by the PAO is provided and multiplies the impact of the PA plan. This process is followed at subordinate echelons as planning guidance is communicated down the operational chain of command.

3-21. There are five phases in the deliberate planning process. Items in parenthesis identify PA actions performed within each phase:

- **Phase I** - Initiation. The task assigning directive outlines the major combat forces available for planning, gives general planning instructions, lists assumptions for planning, and specifies the product document such as an OPLAN, CONPLAN. (PA planners begin assessing the information environment, its impact on operations and the PA requirements to operate within a specific arena.)

- **Phase II** - Concept Development. (Using the supported CINC's mission statement and concept of envisioned operations, the supporting PA planners analyze the mission, formulate tentative courses of actions and develop the PA Estimate for the operational scenario and requirements.)
- **Phase III** - Plan Development. Subordinate commanders use the CINC's concept and the allocated major combat forces as the basis to determine the necessary support, including forces and sustaining supplies for the operation. (The PA planners provide the CINC with recommendations for public affairs assets required, phasing of PA forces and support into the theater of operations, and perform a transportation analysis of their movement to the destination to ensure that the PA segment of the entire plan can feasibly be executed as envisioned. For the supported CINC's PA requirements, above those organic to the tasked major combat elements, the supporting commands [force providers] of each service, as much as possible, identify real-world PA assets to take part in the plan and sustainment to meet requirements. The supporting command identifies PA requirements in OPLANs, OPORDs, and taskings, through operational channels, to major subordinate commands.)
- **Phase IV** - Plan Review. The review process is more than a single phase in deliberate planning. The Joint Staff performs or coordinates a final review of operations plans submitted by the combatant CINCs. It is a formal review of the entire operation plan. Approval of the plan is the signal to subordinate and supporting commands to develop their plans in support of the CINC's concept. (PA planners do not wait until the plan is approved before beginning to develop their supporting plans; they have been involved in doing this, while coordinating with their command's planning staff. In the meantime the CINC has been building the overall plan.)
- **Phase V** - Supporting Plans. The emphasis in the Supporting Plans Phase shifts to the subordinate and supporting commanders. (This is the phase in which PA planners begin to concentrate on how to meet tasks identified in the approved operation plan by preparing Public Affairs Annexes to supporting plans. This input outlines the actions and relationships of assigned and augmenting PA assets.)

INFORMATION ENVIRONMENT ASSESSMENT AND PA ESTIMATE

3-22. Planning fosters effective application of knowledge, logic, and judgment. Analysis of the information environment (IE) starts the process used to develop an estimate of the situation.

3-23. The IE analysis provides the basis for the development of all PA operational plans and is a channel for integration of strategic, operational and tactical planning guidance. It is a method of identifying factors within the information environment that have potential implications for the planning and execution of Army operations. PA planners study and evaluate the dynamics of the area information environment to identify specific public affairs operational considerations.

3-24. Analysis of the information environment focuses on research into the following areas, which will be put into the “Situation and Considerations” portion of the PA estimate:

- Information infrastructure
- Media presence
- Media capabilities
- Media content analysis
- Public opinion assessment
- Information needs assessment
- Impact assessment/courses of action (COA)

3-25. An analysis of the IE using this approach builds a complete picture of the conditions facing commanders and their PA forces, providing them the tools necessary to anticipate trends, actions, issues, and conflicts. The PA staff officer or NCO conducts research and assessment for the estimate then evaluates, prioritizes, and suggests courses of action that public affairs can best support, while considering the information environment. To acquire all the information necessary for an accurate picture of the operational environment, the staff officer or NCO must work closely with intelligence, civil affairs, psychological operations, military police, visual information and other staff sections involved with information gathering.

3-26. The PA assessment must include those aspects under the control of the commander, as well as those the commander cannot control. This can only be achieved with a thorough integration of PA planning at all stages and into all aspects of the planning and decision-making process. Although a variety of techniques may be used in the analysis of the IE, the PA assessment should address the following primary categories.

- **Information Channels and Infrastructure.** This element focuses on an assessment of the information infrastructure. It addresses the resources, communications facilities, organizations, and official and unofficial information channels available within the area of responsibility (AOR). It addresses the means to transmit and receive unofficial information. It addresses specific requirements for American Forces Radio Television Service (AFRTS) information services and the availability of assets to meet theater requirements. It identifies the availability of host nation telephone service for voice and data transmission, the accessibility of audio/video channels, the prevalence of private communications devices such as cellular telephones, facsimiles, computers with modems, radios and televisions, and the nature of the information available through these information channels. It addresses alternate means of voice and data communications, whether military or government contracted, for use in the absence of host nation information channels and infrastructure. Much of the information required for this category may be obtained through civil affairs or psychological operations elements assigned or attached to the command and U.S. Information Service offices supporting consulates or the embassy within the area of operations.

- **Media Presence.** This is an assessment of the media presence in the area of operations prior to the introduction of American forces and an assessment of the expected level of media presence commanders should anticipate once deployment begins. It includes a description of the type of media (print or broadcast), the visibility of the media (local, national, or international; American or foreign), and the focus of the news media present (news or entertainment) covering the operation. The assessment of the media presence should address the authority under which media representatives are operating (open or closed borders, and free press or controlled press) and the reporters' degree of access to the theater of operations.
- **Media Capabilities.** This element is an assessment of the media's information collection, production, transmission and communication capabilities in the AOR. This element analyzes the technological capabilities of the media representatives present within the AOR. It describes their level of sophistication (if they must transport products out of the area of operations for transmission to parent media or do they have self-contained interactive satellite telecommunications access). It also addresses the media's level of logistics support and its potential impact on Army commanders who are required to provide the media free and open access to the AOR. It includes information about their transportation assets, resupply channels, and equipment maintenance requirements. Additionally, the media's general ability to provide their own security should be assessed.
- **Media Content Analysis.** Media content analysis is an assessment of news coverage, the media's agendas and an analysis and prioritization of the potential strategic and operational issues confronting the command. Media content analysis assesses what is being said, by whom, and how it is being presented. It is a constant process that must begin well before planning for a specific operation begins and continues through Mobilization, Deployment, Employment, Sustainment, and Re-deployment. Content analysis reveals the meaning, tone, and accuracy of messages, how the information was presented, and the cumulative affect of the information. A media content analysis will provide an evaluation of the quantity of coverage, both in and out of theater, and the nature of that coverage. This will assist the commander to understand the strategic context, the measure of success and the definition of an end-state for the operation as viewed from outside the command and the Army itself. It will also be an essential element of friendly information (EEFI), as explained in FM 3-13 (100-6), in determining objectives and strategies for communicating the Army perspective, and for working to achieve a balanced, fair and credible flow of information.
- The specific methods for conducting a media content analysis are explained in Appendix O.
- **Public Opinion.** A public opinion assessment surveys the national and international attitude about the operation and the command, leaders and soldiers conducting it. This assessment looks at the perceptions held by major audience and coalition groups, and the relative solidity or strength of those attitudes. It addresses the perceptions held by international

audiences: those traditionally allied with the United States and those traditionally considered to be adversaries of the US. The public opinion assessment should include as a minimum, consideration of the following groups:

- American public (general)
- Civilian political leadership
- Coalition and allied forces and their general population
- Host nation citizens
- International public
- Internal command audience
- Home station community
- Specific special interest groups (if needed)
 - In determining the effects of the media on public opinion, there are three general types of evidence which explain behavior response: direct indicators; indirect indicators; and post-event sampling. Direct indicators are evidence that provide a direct link between the information received by the public and the behavioral response. These indicators include but are not limited to: personal interviews and surveys to estimate awareness and understanding of an issue; dissident group marches, meetings, advertising and other activities; monitoring internal and external law, order and discipline activity; and chain of command after action reports, staff journals and duty logs. Indirect indicators are evidence that identifies behavioral response generated by separate events or activities which appear to be the result of reception of media information. These indicators include: cause-effect estimates from information products and sources other than the military or civilian commercial media; interest level in news media products; shifts in social or economic trends; shifts in political support.
 - Post-event sampling considers the qualitative and quantitative statistical evidence that identifies the level of and nature of awareness and behavioral response to information. This includes the results of surveys, interviews, group observation, probability and non-probability samples, which will identify if and how the public was influenced by information products or messages.
- Information Needs. This is an assessment of the information needs and requirements of the previously identified key publics. It analyzes and prioritizes key external and internal audiences and assesses their news and information expectations. It identifies the types of information that should be made available to soldiers, their family members, other home station community audiences, the American public, and the host nation local populace. It will identify other audiences, such as allied or adversary leaders and publics that will be interested in available "cross-border" information.

PA ESTIMATE AND PA GUIDANCE COORDINATION

3-27. The purpose of the PA Estimate is to determine whether the mission can be accomplished and to determine which COA can best be supported by public affairs. In preparing its estimate, the Public Affairs staff:

- Reviews the overall mission and situation from the public affairs and information environment perspective.
- Examines all public affairs factors impacting on or impacted by the mission.
- Analyzes each COA from the public affairs perspective.
- Compares each COA based on the public affairs functional analysis.
- Concludes whether the mission can be supported by public affairs, and from the public affairs perspective, which COA can best be supported.

3-28. The Public Affairs Estimate summarizes the information environment, prioritizes the major issues confronting the command and predicts anticipated outcomes in detail. It measures the effectiveness of previous and current information strategies, and based on this evaluation, identifies possible courses of action to support command PA objectives. The PA Estimate also contributes to the development of Public Affairs Guidance (PAG) for specific operations or missions. PAG is a primary tool that guides commanders and PA leaders in the application of doctrine and policy during operations. PAG provides the PA force at all echelons standard operating procedures.

3-29. But to be effective, PAG must be developed with the needs of the front-line PA force in mind. PA planners must be able to "see" and "feel" the battlefield. They must have an understanding of the information environment and how it will change throughout the operational continuum. They must be aware that all the resources available at the planning headquarters may not be available or feasible in the theater of operations. Issues that need to be addressed include information release authority restrictions (national, theater or local). These restrictions often place the PA leader in a difficult situation -- one in which an overwhelming number of news media on the scene will seek answers to legitimate questions about unfolding events -- activities that the PA leader cannot discuss. The result is a loss of credibility for the Army.

3-30. DOD policy requires that proposed PAG be provided to the Assistant to the Secretary of Defense for Public Affairs (OTASD-PA) by the unified, specified and other major commands for all operations. This requirement includes major joint training exercises that could attract national and international attention. Subordinate command PA leaders should conduct continuing PA assessments as a part of mission training for theater-specific contingencies in anticipation of PAG development requirements there.

PAG DEVELOPMENT

3-31. Upon receipt of a "warning order," the commander, through the PA staff, will begin development of proposed PAG. In reality this warning order may be preceded by a telephonic "heads up" call from a PA planner at a higher headquarters that allows PA planners to begin working on proposed PAG before the hard copy of the warning order arrives. This proposed PAG should be based on the warning order or other planning guidance, the proposed command

operations plan (OPLAN), and the PA Estimate. Once the proposed PAG is developed, it is staffed through command staff. Once approved by the commander, it is forwarded through major command and Unified/Specified command PA channels to DoD.

3-32. Commanders of Unified/Specified commands should ensure the proposed PAG is coordinated with appropriate elements and functional staffs within the theater of operations. This includes governmental and non-governmental organizations such as the State Department and its embassies, civil affairs, country assessment teams, host governments, allied force public affairs teams, the four U.S. military services and their subordinate commands.

3-33. PA leaders at all levels, specifically major command and above, should work to approve PAG as quickly as possible in order to provide subordinate PA leaders the opportunity to develop and implement PA strategies to support their commands. The format for PAG is included as an appendix to this manual at Appendix E.

PA ANNEX DEVELOPMENT

3-34. Once the PA estimate and proposed PAG are completed, and the other staff officers have completed their estimates, the commander selects a course of action. The commander then outlines it to the staff. The commander may select one of the proposed COAs, a combination of two or more, or a completely new one. The PA staff must then be prepared to enter the plan development phase (Phase III) which requires development of a PA annex. A format for a PA Annex is included at Appendix D.

3-35. The operation-specific approach to conducting public affairs activities is called a PA scheme of maneuver. This PA scheme summarizes the commander's PA intentions, and details the media facilitation, news and information provision, and force training and support procedures, which will be employed to support a particular operation.

3-36. The PA scheme consists of the PA estimate of the situation, higher command PA guidance, and the selected course of action. It is coordinated with key staff agencies, integrated into the operation plan through the development of a PA annex, and synchronized with the other activities to be executed as part of the basic plan.

3-37. The PA scheme, when included in the PA annex, should not only identify public affairs force requirements for the operation, but more importantly, it must provide the commander a visual picture of how public affairs will support the commander's concept of operation as outlined in the plan.

3-38. The PA activities addressed in the PA scheme of maneuver are:

- **Media Facilitation.** Media Facilitation is activities executed to support news media efforts to cover the operation, facilitate the timely, accurate, balanced provision of information which communicates the Army perspective, and minimizes the media disruption of operations or endangerment of mission accomplishment. Media facilitation is accomplished by the early establishment of a media center as the focal point for media representatives seeking to cover the operation. Normal

media center operations include scheduling briefings, coordination for interviews; responding to media queries; coordinating unit visits and media escort requirements; and resolving media - military incidents. To prepare for encounters with the media, commanders must accept and understand the role of the news organizations and the journalists in the theater, and their capabilities in getting information from the battlefield or area of operations. Commanders must provide media access to the force, keeping in mind the impact their technology will have on operations security. Commanders must identify and provide support and resources to assist the media in their mission.

- **Information Strategies.** Activities executed to fill the news and information needs and expectations of internal and external audiences. Proliferation of personal computers, the World Wide Web, the Internet, on-line services, fax machines, E-mail, cable television, direct broadcast satellites, copy machines, cellular and wireless communication and many other information technologies have created an endless stream of data and information that flow into a world filled with images, symbols, words, and sounds. Public affairs specialists acquire information using a variety of sources. Because of the volume of information and the vast number of potential distribution mediums, the PA staff uses a systematic acquisition strategy. They acquire information from participants, leaders, developed sources, the media, research and development, intelligence, culture at large, and subject matter experts. Print, video, audio and electronic information products are provided to deployed soldiers, home station audiences such as family members and the home station community and news media representatives using contracted services and organic military assets. They communicate the Army perspective and contribute to timely, balanced coverage of the operation.
- **Force Training and Support.** Activities executed to assist members of the DA community in interacting with media representatives. Force training and support are conducted to educate soldiers, family members and DA civilian employees on their rights and responsibilities with respect to news media representatives attempting to provide coverage of an operation and related issues. It focuses on helping them to respond when they encounter news media representatives seeking interviews, photo opportunities, responses, reactions, interpretations or comments on an operation, policies or events. The intent of force training and support is to assist members of the community and media representatives in approaching each other with mutual respect. Training for public affairs personnel expands on soldier and unit leader training. It stresses individual as well as collective tasks with an aim of developing units fully prepared to accomplish the range of public affairs missions. It integrates public affairs into the battle staff and trains PA planners to assess the operation environment from a public affairs perspective, produce a PA Estimate, develop the PA Annex and PA Guidance.

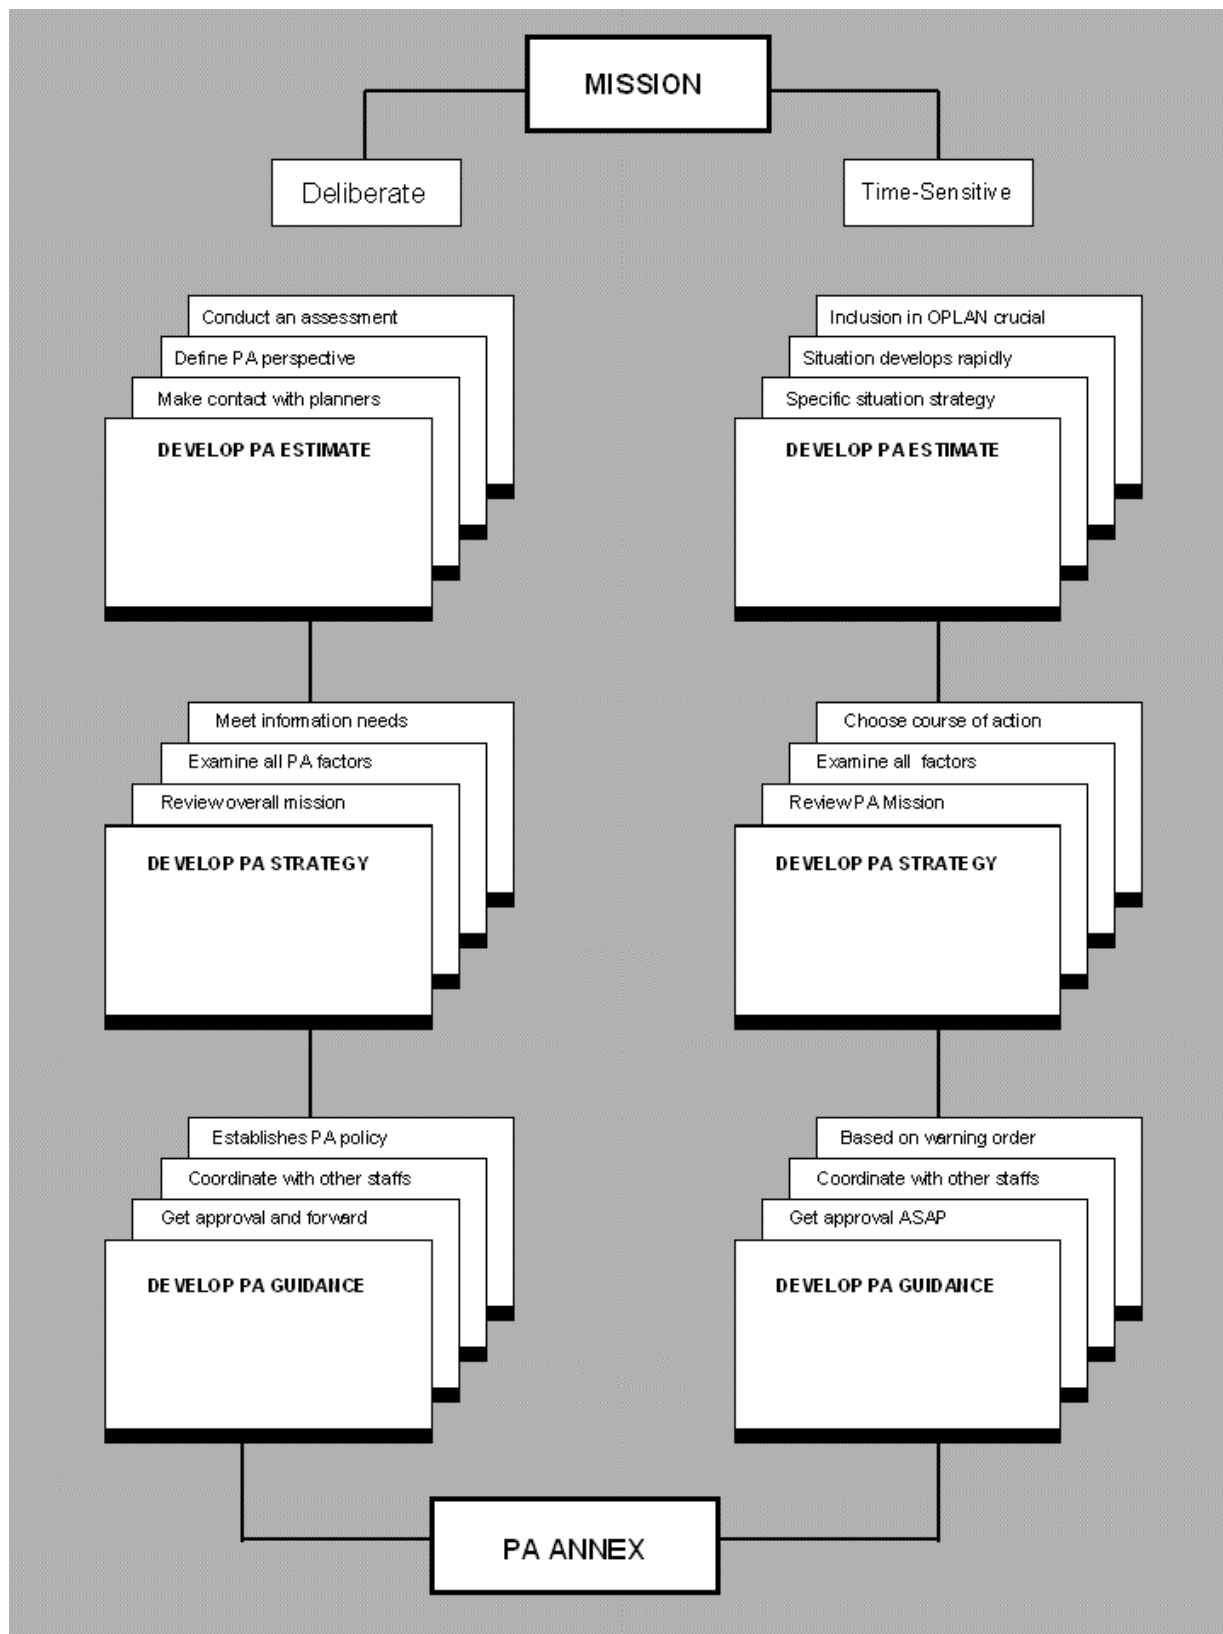

Figure 3-1. PA Planning

PA INTEGRATION INTO STAFF PLANNING

3-39. Concurrent with formulation of the PA staff estimate, PAG development, and production of the PA Annex to the OPLAN, PA planners must be an integral part of the staff planning process, especially on the following matters.

3-40. **Force Planning.** In force planning, the PA staff works with the J3/G3/S3 staff. Force planning consists of PA force requirements determination, force list development and refinements in light of PA force availability and PA force shortfall identification and resolution. In force list development, the PA assets needed to meet the mission are identified. Force availability is considered based on the strength and readiness of organic PA units, their personnel and equipment. Identification of PA force shortfalls addresses the lack of organic or mission-capable PA assets and the additional requirements and augmentations for PA units and personnel needed to accomplish the CINC's concept of operations. All taskings for unit or personnel augmentation must be validated and requested through the J3/G3/S3 operational channels. Tasking authority does not exist PA staff to PA staff or PA staff to subordinate unit.

3-41. **Support Planning.** To plan for logistical support of PA units and personnel assigned to carry out the CINC's concept of operations, the PA staff coordinates with and identifies support requirements to the J4/G4/S4. Specific logistical areas of concern include support in all classes of supply to the PA force, availability and authorized levels of support to civilian media, local purchase and contract support, property accountability, and vehicle transportation and maintenance support as tasked for through the J3/G3/S3.

3-42. **Transportation Planning.** PA forces move from their home station to a specified destination in the theater, either as part of their parent organization or a task-configured PA unit. This movement involves planning by several echelons of command, possibly stops at several intermediate locations en route, and a schedule constrained by a variety of operational requirements and priorities. Key staff for the PA planner to interact with include the command's transportation officer, movements control officer, and staff officers within the J3/G3/S3 and J4/G4/S4 that have staff supervision in this area. Key items PA planners need to track in this process are:

3-43. **Time-Phased Force and Deployment Data (TPFDD).** The TPFDD is the JOPES database portion of an operations plan. It contains time-phased force data, non-unit related cargo and personnel data, and movement data for the operation plan. The Appendix 1 to Annex A of the operation plan is the Time-Phased Force and Deployment List (TPFDL) which identifies types and/or actual units required to support the operation plan and indicates origin and port of debarkation or ocean area. It may also be generated as a computer listing from the TPFDD. PA planners must ensure that the TPFDD/TPFDL contains their unit line numbers (ULNs) for units, personnel, or cargo. Assets not listed on the TPFDD do not deploy. It is crucial to the planning process that the PA staff closely coordinate with the J3/G3/S3 and J4/G4/S4 to ensure that PA assets are reflected on the TPFDD or included as organic/attached assets to parent units with validated ULNs on the TPFDD.

3-44. **Destination (DEST)** - the geographic location where the force is to be deployed/employed.

3-45. The distances between the port of debarkation (POD) within the theater of operations to the destination (DEST), to the port of support (POS), to the marshaling area or assembly area. Where troops land at the APOD (Aerial Port of Debarkation) or SPOD (Seaport of Debarkation) they may be substantial distances from the port where the PA element's equipment arrives in theater and operations begin.

3-46. Transport of equipment must be planned for it to be available at the earliest possible date within the theater of operations. Thus, the PA planner must set a realistic, achievable required delivery date (RDD). This must be aligned with the CINC's required date (CRD). Planners begin with the RDD to establish two interim dates, the earliest arrival date (EAD) and the latest arrival date (LAD). Once these dates are established, then the ready to load date (RLD) and the available to load date (ALD) are established at home station to meet the earliest departure date (EDD).

3-47. **Communications/Automation Planning.** Key planners on the coordinating staff for communications and automation planning are the J6/G6, G3/S3 and CE officer. Specific concerns include priorities for radio/telephone communications, satellite uplinks and downlinks, number of telephone links/trunks allocated to PA requirements, E-mail access, and inclusion into the Communications Electronics Operating Instructions (CEOI). In addition, consider possible development of web pages or sites, like BosniaLink, the Task Force Eagle Homepage, the Desert Voice in Kuwait or Task Force Falcon in Kosovo.

3-48. **Information Environment.** When formulating PA plans and coordinating on the overall plan with the commander's staff, PA planners work closely with the staff element having supervising responsibility for each separate issue.

- Operational Security - G3/S3
- Psychological Operations - G3/S3
- Civil Military Operations - G5/S3
- Combat Camera Operations - G3/S3
- Armed Forces Radio and Television Operations - G3 and Armed Forces Information Service

APPLYING METT-TC

3-49. To function as part of a deployed or deployable organization the PAO and PA NCO must think and state requirements in terms that the rest of the organization can understand. Moreover, the PAO must fit the operational PA requirements into the operational planning procedure of the organization about to deploy. Operators think in terms of mission, enemy, terrain and weather, troops, time available and civilian considerations or METT-TC. METT-TC is used to envision how the operation will occur, to identify potential risks or hazards, and to define troop and equipment requirements.

3-50. **Mission** - alert, marshal, deploy, operate (internal information, media facilitation, information provision) redeploy

3-51. **Enemy** - rumors, disinformation, propaganda, OPSEC

3-52. **Terrain and weather** - theater of operation, theater of war, area of responsibility, intermediate staging base, homestation and weather condition

3-53. **Troops** - embedded assets, units (PADs, MPADs, BODs, PAOCs) AFRTS, HTNRs, ABS, NBS, JIBs, Star and Stripes, stringers, surrogate PAOs, Adjutants, and S1s. All other AG services, signal, USIS, DoS and homestation forces and audiences

3-54. **Time available** - timeline, transition, reports

3-55. Essentially, the information required for a METT-TC analysis is provided by the PA estimate of the situation, which contains the selected course of action and detailed descriptions of PA actions to be performed. These requirements are then translated into the command's planning language and format, resulting in the PA Annex to the OPLAN or OPORD.

3-56. At theater level and above, the PA annex is normally Annex F to the OPLAN. At corps and below, commanders can tailor their plans to fit specific needs or preferences, so the PA annex may fall in another location among the annexes. Regardless of where it is located, the PA Annex is used to provide information about the conduct and execution of public affairs operations in support of the basic OPLAN. The PA annex outlines the situation, identifies the specific PA mission and explains the concept of the operation. It also provides detailed information and guidance PA personnel need to conduct successful PA operations at the operator level. A sample PA Annex format is included in this manual at Appendix D.

3-57. Phase IV, Plan Review, consists of staff coordination and plan adjustment or correction.

3-58. The final phase of the planning process, Phase V, Supporting Plans, follows the same course as the first three phases, with attention aimed at the specific aspects of the overall plan. These supporting plans focus on conducting specific operations, which must be successful in order to guarantee success of the larger mission. PA support to these supporting plans is as important as PA coordination and input to the main campaign plan.

STANDING OPERATING PROCEDURES

3-59. Integral to the operational effectiveness of PA sections are their standing combat operating procedures. These routine procedures ensure that all members of the section are working in concert toward the same PA objectives and that PA activities are easily blended into the actions of the command's staff.

3-60. PA SOPs differ from PA plans and PA annexes to OPLANS in that they specifically detail and describe how PA is conducted within a certain command or unit. They are routine procedures and actions that apply to each section or unit.

3-61. The senior PA NCO prepares the staff section or unit PA SOP. PA units designated to support or augment specific commands in the execution of contingency missions should use SOPs from these supported commands.

3-62. SOPs should address:

- Preparation for combat. Stockage, prepackaging, and maintenance of vehicles, equipment, and expendable and nonexpendable supplies.

- Vehicle load plans.
- Alert and mobilization actions, routines and procedures.
- Composition of quartering and/or advance parties and rear echelons.
- Organization for combat, including detailed delineation of duties for each individual, shift compositions, and plans for reconstitution in the event of combat losses.
- Operations center and media center layouts (theater, corps and/or division main/rear CPs).
- Procedures for preparing, disseminating and disposing of records, reports, estimates and orders.
- Physical, document, and tactical security.
- Communications procedures. These steps include radio/telephone operating procedures unique to the command, message routing and preparation formats, and operation of communications and data transmission equipment.
- Movement and displacement.
- Operations under NBC conditions.
- Field Maintenance.
- Personal hygiene, rest, and morale, welfare and recreation requirements and procedures during deployment.
- Post-operations and reconstitution procedures. Maintenance, restocking and packaging composition of advance and rear parties; disposition of records, and preparation of after-action reports are included.
- A PA SOP outline is included in this manual at Appendix K.

POST-MISSION PLANNING CONSIDERATIONS

3-63. During mission planning and preparation, Public Affairs planners should consider debriefing and other post-mission activities. These activities normally include:

- Collective debriefing of the operational element on all aspects of mission execution, including lessons learned.
- Collection of maps, notebooks, logbooks, plans, annexes, duty officer/NCO logs, serious incident reports, news releases, tapes and transcripts of news briefings and conferences, and all other information products pertinent to the mission after action report.
- Maintenance and storage of unit and personal equipment.
- Individual debriefing of key personnel.
- Other reconstitution measures as required.

3-64. Upon completion of these activities, the operational element begins pre-mission sustainment training or prepares for its next mission. The planning staff begins review of lessons learned for integration into future plans. See Appendix W for information on producing PA Lessons Learned for the Center for Army Lessons Learned.

Chapter 4

Media Facilitation

"It is likely that small pools of news media will be assigned directly to operational units to cover all facets of activity. With few exceptions, there will be no security review of media copy or audiovisual products. The policy will be to maintain security at the source. It is important to support the efforts of the media and our dealings with them should not be confrontational, but professional and courteous."

- GEN Binford Peay
Commander, U.S. Central Command [1994]
FM 3-61 (46-1), Public Affairs Operations

PRINCIPLES OF INFORMATION

4-1. In the past 20 years the Army has undergone a fundamental shift in our approach to dealing with the news media. In response to the perceived treatment by the press during the Vietnam War, we have gone from adopting an exclusionary tactic for the conduct of the invasion of Grenada in 1983, to managing the controversial pool system for covering the initial stages of the Gulf War in 1991, and more recently evolving into an almost completely open access policy in Somalia (1993), Haiti (1994) and Bosnia (1995) operations.

4-2. The results of this policy evolution are the "DoD Principles of Information," which form the foundation for the PA function of media facilitation. The basic approach that DoD and the Army take to media facilitation is contained in Appendix A, The DoD Principles of Information and Appendix B, The Guidelines for Coverage of DoD Combat Operations.

4-3. Simply stated, media facilitation is providing assistance to civilian and military news media representatives covering an operation. The objective of media facilitation is to support news media efforts. This includes providing accurate, timely, balanced, credible coverage of the force and the operation, while minimizing the possibility that media activities will disrupt the operation.

4-4. Media facilitation includes assisting media entry into the area of operations, registering media representatives, orienting them on the ground rules for coverage and ensuring that they understand the security policies and constraints under which they must agree to operate if they desire Army support.

4-5. Media facilitation also involves arranging interviews and briefings, coordinating unit visits and escorts, and assisting media representatives with transportation, messing, billeting, communication support, safety and equipment. Media facilitation involves the early establishment of a media center as a focal point for media wishing to cover an operation, for Army personnel seeking assistance with media representatives in their area, and for resolution of problems or incidents resulting from media-military interaction.

4-6. A primary strategic goal of any Public Affairs staff is to support an operational commander in achieving a constant flow of complete, accurate and timely information about the mission and U.S. forces.

4-7. The PA staff accomplishes this goal by making information fully and readily available within the constraints of national security and OPSEC, and by facilitating inclusion of civilian and military news media representatives in military units whenever possible.

PA STAFF AND MEDIA CENTER RESPONSIBILITIES

4-8. **PA Staff Sections.** The prime focus of the PA staff is staff coordination. The staff will be the element tasked with executing the media facilitation strategy.

4-9. The staff provides PA planning and operational guidance to the PAO. They ensure leaders within the command understand the commander's media relations policies, and serves as the command ombudsman in the settlement of conflicts between the media and the military.

4-10. As an active participant in the command's information planning element, the staff coordinates with G2, G3, G5, PSYOP, U.S. Information Service, and other staff elements in developing the commander's information strategy to ensure synergy and to reduce the probability of conflicting messages.

4-11. **Media Operations Centers.** Currently, joint, combined and Army media centers fulfill the requirement for a focal point for the news media during military operations. In essence, the media operations center (MOC) is a command post for media support efforts. It serves as both the primary information source, and as a logistical support and coordination base for commercial news organizations covering the operation.

4-12. Media centers are organized when large numbers of news media representatives are anticipated to cover military activities. Media centers may be formed for all types of operations or for any stage within an operation.

4-13. When operated by unified/specified commands, these media centers may be called a Joint Information Bureau (JIB). At the combined commands, they are called an Allied Press Information Center (APIC), Coalition Press Information Centre or Combined Information Bureau (CIB). At theater level and below, they are simply referred to as Media Operations Centers.

4-14. MOCs support the commander and are subordinate to the command's PAO. They provide the commander a professional, immediately available, fully trained organization designed to respond to

national and international civilian media interest in American military operations.

4-15. In addition, the media operations center provides the following functions:

- A single point of contact and information source for media within the theater
- Briefings and enforcement of media guidelines and ground rules
- Primary information release authority for the senior PAO
- Coordination of news media coverage with corps, divisions, brigades, etc.
- Coordination with all service branches for each service, agency or country
- Identification and communication of host-nation sensitivities to all personnel in theater
- Preparation for and conducting press briefings and news conferences
- Registration of news media personnel
- Media Operations Center Staffing and Organization

4-16. Organization and personnel staffing of media operations centers are determined by the responsible command in coordination with the PAO and his staff. APIC staffs should be a proportionate representation of the forces, with representation from all services involved in the operation. This will be determined by CPA at the unified command. Regardless of the echelon establishing a media operations center, the organizational model is functionally designed and remains relatively the same.

4-17. MOCs normally consist of two major elements: a Headquarters Group and a Media Operations Center Group.

4-18. The headquarters is made up of the command group and support staff. The command group contains the commander, deputy commander and/or executive officer, and the sergeant major. The support staff is normally task organized to support tailored forward deployed MOC teams or sub-MOCs when the APIC operates as other than a single element. The support sections provide administrative support, conduct lease and purchase contracting, setup, operate and maintain the unit's equipment, and conduct the day-to-day operation of the MOC. The support sections are responsible for the execution of MOC communications, supply operations, administration support, vehicle maintenance, security and other support functions as required.

4-19. The Media Operations Center consists of a Plans Section, a Media Support Section and an Information Operations Section.

4-20. The plans section is responsible for all MOC media planning. It establishes MOC requirements and determines operating procedures and policies. It maintains channels of communication with OASD(PA) and the JPAO (or senior command PAO). It is responsible for recommending and assisting in the development and dissemination of PA Guidance. It monitors available major U.S., international and local television and radio broadcasts and print publications providing coverage of the

operations, conducts news media analysis and evaluates the effectiveness of MOC operations.

4-21. The Media Support Section (MSS) is the primary point of contact for news media representatives (NMRs) in an area of operation seeking information or assistance in covering the force and the operation. The MSS receives and registers NMRs, briefs NMRs on the media ground rules and security procedures or concerns, and orients them on the force, the operation and other pertinent issues (special safety or host nation considerations).

4-22. The MSS orchestrates the command's news briefings and coordinate for subject matter experts to explain and discuss operations and capabilities. The MSS is also responsible for coordinating for appropriate, knowledgeable escorts, unit visits, and service member interviews. It assists the Joint Force or other senior PAO in preparing service members for interaction with the news media. Finally, it provides support to Joint Force elements and service component PA elements seeking assistance with NMRs.

4-23. The Information Operations Section is responsible for monitoring plans and operations from within the command's operation center and assessing the PA implications of events occurring throughout the area. It ensures that the MOC has current situation information, is aware of issues of potential media interest, and can obtain any operational information necessary for the development of responses to media inquiries in a timely manner.

4-24. The IO section ensures that PA operations are synchronized with other combat functions and promote early coordination of PA, CA and PSYOP functions.

4-25. **MOC Staffing.** Currently, media operations center staffing requires augmentation, either by PA-trained individual fillers or by Army PA units. As fully independent units, the Public Affairs Operations Center (PAOC) (SRC 45423A000) and Mobile PA Detachment (MPAD) (SRC 45413A000) are currently organized, trained, and prepared to fill this role.

4-26. In fact, these Army PA detachments are specifically designed to function as an Army media operation center in theater, corps, or division-controlled operations. MPADs can be combined to form media sub-centers in forward battle areas.

4-27. PA personnel from non-deployed commands and installation PA sections may be called upon to augment news media centers however, requests for individual augmentation should be coordinated through operational channels. Reserve and Guard unit personnel can be used to augment on a voluntary basis.

4-28. An example of a media operations center is included at Appendix L.

MOC OPERATIONS

4-29. In major operations -- actions conducted by unified commands -- a Joint Information Bureau will usually be the first to deploy for this purpose. A JIB will be staffed by public affairs personnel from the services represented in the joint force; participating services may

establish their own media centers subordinate to the JIB to disseminate information about their particular missions.

4-30. As the operation unfolds, the Army plans for and contributes to a replacement PA organization for the JIB which consists of individual PA personnel from each of the services and Army PA detachments.

4-31. Media Center operations will be based on five primary assumptions:

- Accurate information is available in a timely manner and adheres to the DoD Principles of Information in Appendix A.
- Current trends in communications technologies within the information environment will continue to reduce the news media's reliance on military support and assistance when covering operations and will continue to increase the availability of information to a worldwide audience.
- Media representatives will be in an area of operations at the start of, and in most cases, before an operation begins.
- Media interest and coverage in non combat operations may be higher at the outset, and barring a significant event which renews national or international attention or interest, will taper off over time. During a high-intensity conflict, media interest could remain high.
- Military PA elements require access to complete information, state-of-the-art communication equipment, and must possess sophisticated coordination channels in order to pre-empt speculative, inaccurate or biased reporting.

4-32. Media centers will support and be responsible to the senior commander of the operation on a 24-hour basis. Media centers are usually established by unified command CINCs to support the news media in an area of operation.

4-33. During the first 24 hours after arrival in a new theater of operation, a media center can provide limited media support services.

4-34. Within this first operational day, the MOC must:

- Establish a "hasty media center" as the initial focal point for the news media until additional media support forces arrive.
- Establish communication with OASD (PA), each service's PA chain of command, and with units operating within the theater.
- Request operational information release authority within the theater.
- Establish command structure/lines of authority.
- Coordinate with appropriate authority for leasing and purchasing contracts.
- Begin to register news media personnel in the area
- Provide basic media support (coordination of media access to subordinate units and media escort as resources permit).
- Assist or conduct command news briefings and conferences.
- Coordinate Subject Matter Expert (SME) interviews.
- Be capable of assisting in the transmission of media products.

4-35. Media Support -- Initially, the media operations center will need to provide varying degrees of support to news media personnel including specialized equipment (flak vest, NBC gear, helmets), transmission of media products, etc.

4-36. This support may include but not be limited to:

- Coordinate media contact with units or individuals to include SME interviews
- Provide a single point of contact for information on operational issues
- Provide news releases, fact sheets, copies of transcripts for news briefings/conferences and copies of archival file products
- When other means are not available, the media center may provide coordination for transportation (to and from interview sources), transmission of media products and food and billeting
- Provide limited media escort within the area
- (SOPs for MOCs should be pre-established for each theater of operation and used for media operations within that theater.)

REGISTRATION OF MEDIA

4-37. Principle to supporting the commander's information strategy is the inclusion of news media representatives (NMR) within Army units from the earliest pre-deployment stages of all operations. The personal safety of media representatives, as acknowledged by the media themselves, is not a reason for excluding them from operations.

4-38. However, all media requesting support or access to units to cover Army operations must be registered. This includes freelance journalist, military media representatives, such as those who are assigned to Armed Forces Radio and Television Service, Stars & Stripes newspaper and other Armed Forces Information Service (AFIS) personnel who are not supporting units on the battlefield.

4-39. **Registration versus Accreditation.** Accreditation is the verification and validation that a person represents a legitimate commercial news organization. This means that accrediting governments or military organizations will physically verify the affiliation of an applicant with a specific news organization.

4-40. This is difficult to perform amidst an ongoing operation, especially when deployed far away from CONUS. It is generally accepted that, when overseas, the decision to accredit news media is made by the host nation's government in coordination with the combined or unified commander.

4-41. When accreditation isn't required by the host nation, responsibility for this determination is held by the combined or unified commander. Accreditation is normally performed at Corps level or higher.

4-42. Accreditation is a major problem for many commands because they are forced to determine the legitimacy of smaller, lesser-known news organizations and freelance journalists without news organization affiliation.

4-43. Unless it is absolutely required by host nations, the American military will attempt to avoid accreditation.

4-44. Registration, however, is merely an accounting tool, which provides PAOs the ability to know what media are represented in the theater, where they are located, and their movement around the theater. This information is helpful in planning and conducting media logistical support and transportation, and in preparing subordinate commands for media encounters. It is also helpful to commanders who might want to provide newsworthy events to the media.

4-45. Registration also identifies which news media have asked for military assistance and access, and have agreed to the command's media ground rules.

4-46. **Registration Requirements.** The registration process is conducted in five basic steps:

- Verify the identity of the media representative (including checking for valid passport/visa, professional media organization membership card, media ID card, other military press credentials, etc.).
- Have them sign an agreement to abide by the established media ground rules for the operation in exchange for granting support, access to units, information and other privileges. If required, revoke credentials for those who violate the ground rules. (Enforcement of this requirement is essential.)
- Have NMR agree to and sign a liability waiver that frees the military of responsibility if the NMR is killed or injured as a result of covering the operation. (An example of a waiver of liability is at Annex I).
- Give NMRs proof of registration (memorandum, press badge or other identification).
- Maintain a roster of registered NMRs and monitor their movements during the time they are receiving military support.

4-47. NMRs who refuse to agree to the military ground rules and who are not registered will receive only the support and information assistance as provided to the general public.

4-48. NMRs should be informed that registration and acceptance of media ground rules will entitle them to better access to units and subject matter experts, and provision of military ground and air transportation when possible.

MEDIA GROUND RULES

4-49. Media ground rules will assist in protecting the security and the safety of the troops involved while allowing you the greatest permissible freedom and access in covering the story. All interviews with news media representatives will be on the record.

4-50. Security at the source will be the policy. (An example of media ground rules is in Appendix X.)

4-51. The following categories of information are releasable:

- Arrival of major U.S. units when officially announced by a U.S. spokesperson. Mode of travel (sea or air) and date of departure from home station

- Approximate friendly force strength figures, after review by host nation government
- Approximate enemy casualty and POW figures for each action operation
- Non-sensitive, unclassified information regarding U.S. air, ground and sea operations (past and present).
- Friendly force size in an action or operation will be announced using general terms such as multi-battalion or naval task force
- Specific force/unit identification/designation may be released when it has become public knowledge and no longer warrants security protection
- Identification and location of military targets and objectives previously under attack
- Generic origin of air operations such as land or carrier based.
- Date/time/location of previous conventional military missions and actions as well as mission results
- Types of ordnance expended will be released in general terms rather than specific amounts
- Weather and climate conditions
- Allied participation by type of operation (ships, aircraft, ground units, etc)

4-52. Information Not Releasable

- Information about future military plans, activities or operations
- Vulnerabilities or weaknesses on command, control, personnel or the operation
- Friendly unit and command strengths, on-hand equipment or supplies; the presence, activities and methods of operation of specifically designated units or equipment
- Information on friendly force security and deception measures and countermeasures, and intelligence collection activities
- Specific information on friendly force current operations and movements, deployments and dispositions
- Information on in-progress operations against hostile targets
- Information on nuclear, biological or chemical weapons, equipment or training

MEDIA POOLS

4-53. Journalists, as a group, are strongly opposed to media pools in any form. The media pool is seen as a restriction placed on the media representatives and their ability to provide coverage of the news. They are grudgingly tolerated, and should be only used as a last resort when space onboard military transportation is limited, access to an area must be controlled, and after all other possibilities have been explored and eliminated. Even under conditions of open coverage, pools may be appropriate for specific events. Both the Army and the news media are in agreement, however, that limited access is better than no access at all.

4-54. When a pool system is required, the military PAO will identify the maximum size of the pool that can be supported. The news media

representatives on the scene will select media pool members. A roster of media personnel registered with the Army PAO will be used to identify the media representatives eligible to participate. The pool should consist of, but not be limited to, a minimum of one video crew (camera operator, sound technician and reporter), one still photographer (wire service, newspaper, or magazine), one radio reporter, and one newspaper or wire service reporter. Special consideration must be given to international reporters as well. While this is a fair and representative pool structure, it is the media themselves who must determine the make-up of the pool. Some news events and situations may lend themselves more to print, or conversely television reporting, and the media representatives may choose to select an unbalanced pool.

4-55. All pool members must be willing and able to meet deadlines and supply information products (video, audio, still media, and text) in a timely manner to all media representatives who are entitled to material generated by the pool. The military media center will also have access to this information and will make it available to all other requesting news media organizations.

4-56. Consistent with its capabilities, the military will supply PAOs with facilities to enable timely, secure, compatible transmission of pool material and will make these facilities available whenever possible for filing independent coverage. In cases when government facilities are unavailable, journalists will, as always, file by any other means available. The military will not ban communications systems operated by news organizations, but electromagnetic operational security in battlefield situations may require restrictions on the use of such systems.

4-57. Once a media pool has been selected, the media pool will select a team leader. It is the responsibility of this team leader to ensure that members of the media pool meet their obligation to share information. The Army PAO will not involve himself in settling internal disputes of the media pool.

4-58. Finally, the pool is an option of last resort. It should be disbanded as soon as free and open access to the operational area can be allowed, normally within the first 24 hours of an operation.

THE DOD NATIONAL MEDIA POOL

4-59. The DoD National Media Pool was established to prevent recurrence of problems encountered with media coverage during Operation Urgent Fury in Grenada in 1983. During the first 24 hours of Urgent Fury, more than 600 reporters attempted to gain access to the operation. The large numbers overwhelmed the limited Public Affairs elements available to assist them.

4-60. In 1985, the Secretary of Defense established the DoD National Media Pool, a civilian news element of approximately 16 media representatives from various national news organizations, with the mission of covering an operation from its initial stages until open coverage could be allowed.

4-61. The pool members remain on call in Washington, D.C., and are available for immediate worldwide deployment. Their products are shared by the open news media until the pool is disbanded and access is granted to the entire news community.

4-62. Supported commanders are responsible for providing operational support to the DoD National Media Pool. At a minimum, the pool members will require:

- Daily, comprehensive and unclassified operational news briefings.
- Access to ongoing combat operations. The media are aware of the personal risks involved in covering combat operations. They will not be denied access to them based on risk to their personal safety.
- Reasonable access to key personnel. All information gathered from these personnel is unclassified and on the record.
- An escort -- usually a lieutenant colonel or colonel -- to coordinate pool support and access requirements.
- Transportation and itinerary planning and coordination that will allow media to gain access to the theater of operations and to disperse pool members throughout the operational area.
- In today's global information environment, when news media can report live from almost anywhere in the world in almost any environment, the technological capabilities of most news organizations decreases the importance of the DoD National Media Pool once word of an operation has spread.
- When the DoD media pool is operational, PAOs will attempt to provide the same information support concerning theater operations to all other media in the operational area.
- However, their primary responsibility is to the DoD Media Pool. After the DoD media pool is dissolved, all media in theater will be dealt with in an equitable manner with respect to information and support provided.
- As soon as open access to the operational area can be allowed (normally within the first 24 hours of an operation), the DoD National Media should be disbanded.

NEWS BRIEFINGS

4-63. There are several reasons for holding news briefings, in addition to the daily operational news briefing required at the unified command level.

- **Credibility:** The physical presence of a briefer and his willingness to meet the issue head on leads to a much more credible presentation
- **Uniformity:** All media get the same information at the same time.
- **Expression of concern:** A briefer represents the face of the command, which shows more concern than an impersonal news release, especially in situations where there is loss of life or extensive damage.
- **Complexity of material:** Where material is technical or complicated, the news briefing makes the subject matter more easily understandable. The question and answer session that accompanies a news briefing saves time in call-backs by news reporters needing clarification.

4-64. News briefings should be done daily during an operation and when important events dictate. They should:

- Get out a specific message
- Explain complex or technical matters
- Reach a large number of media interested in the same subject matter area.

4-65. PA specialists should think about media deadlines and set the time to help the media meet those deadlines. Be sure to invite all media within the area in a timely manner.

4-66. A knowledgeable and articulate spokesperson should be chosen to present the material. This should be the subject matter expert (SME), but may be the PAO or the commander. At the very minimum, a person of prominence within the command should be selected.

4-67. Other SMEs may be in attendance at the briefing to field technical questions. The SME interviews should be at the request of an individual media representative and the time should be set to facilitate the media to meet those deadlines.

4-68. Consideration should be given to the appearance of the presentation, the message, space, lighting, electrical needs, suitable setting, chairs, tables and press packets. All handouts should be reviewed.

4-69. Appendix H provides briefing and press conference formats.

Chapter 5

Information Strategies

The defining trend of the 1990s, from corporate boardrooms to private living rooms, is connecting everyone and everything to everyone and everything else. The American public is faced with many choices: interactive television, cellular phones, modems, faxes, personal digital assistants, an assortment of daily newspapers, online computer information services and other easily accessible information services -- if it can be connected, it seems to be in demand. The computer has invaded the American home. In this decade it has become routine that news and information can now be tailored to fit the individual needs of the consumer using on-line services, distributed electronically and received instantaneously at his or her computer. With the sophistication, power and miniaturization of these technologies improving each year, and the cost dropping at an equally rapid pace, the public will expect access to these devices and services and the information they carry. These emerging technologies have contributed to the refocusing of the Public Affairs mission. It has resulted in shifting the information provision function from an emphasis on producing specific products (such as post and field newspapers and radio/television news programs) to focusing on the processing of our themes and messages and their intended effects -- the function of information communication, rather than the form. This chapter explains the objectives of information strategies, identifies and explains the elements of information strategies, and describes the relative advantages and disadvantages of present day and emerging information communication channels available to PA organizations. Most importantly, it explains how best to use these information channels to satisfy the information needs of the various target audiences as we enter the information age.

INFORMATION STRATEGIES

5-1. Information Strategies is the sum of all actions and activities, which contribute to informing the American public and the Army. The responsibility for this activity is assigned to an element within each PA section, which focuses entirely on accomplishing the information strategy mission. This section is usually called the Public Affairs Information

Services Section. At all echelons, it employs numerous techniques to provide news and information to internal and external audiences. The Army provides an expedited flow of complete, accurate and timely information, which not only communicates the Army perspective, but also attempts to educate audiences and engender support for the force.

5-2. Using a combination of contracted services, organic military assets, and government and commercial communications networks, Public Affairs organizations provide information to news media representatives, deployed soldiers, home station audiences and the American public. The Information Services Section within a Public Affairs organization coordinates information efforts and develops informational products (such as digital text, graphics, and photos, printed publications, audio/video news releases and graphic imagery) into consolidated campaigns designed specifically to present the Army's perspective. This means that Army Public Affairs communicates information to create an informed American public and Army force, assist them in gaining a clear understanding of the strategic, operational and tactical situation.

5-3. To accomplish this, the Information Services Section must develop information objectives or goals during the planning process prior to an operation. These information goals are similar to the PA standards of service and support, which appear in Appendix Q, in that they establish a basis for determining successful information communication operations.

5-4. These information objectives should include:

- Ensuring an understanding of the role of America's Armed Forces in American society.
- Ensuring an accurate perception of the particular military situation or mission.
- Ensuring an understanding of individual and unit roles in mission accomplishment.
- Establishing confidence in America's Army to accomplish the assigned mission in accordance with our national values.
- Establishing confidence in and support for American soldiers.

5-5. By establishing a comprehensive information strategy program, Public Affairs can assist in mission accomplishment by increasing audience understanding of the situation and establish confidence in and support for the force. This contributes to unit cohesion and provides commanders with increased range of action, free of distractions and limitations.

5-6. This is best accomplished by three basic types of information campaigns:

- **MISSION.** Both external and internal publics need to know what the mission is, what they're being asked to do and why. They need to know not only the organization's mission, but also how it fits into the big picture -- the political/strategic-level situation, and why it is important.
- **ROLE.** All military members and civilian employees need to have an understanding of their job and how it relates to mission accomplishment. The general public needs to have an accurate understanding of the military's role and its ability to accomplish

the mission. This understanding results in confidence in the force and demonstrates American unity and resolve.

- **MORALE.** Military members need to have access to news and information about current events and the activities available to them while deployed. They also need to have access to information from civilian commercial news sources. This is important because, in addition to being more credible, it allows the deployed force to see how the operation and their participation in it are being portrayed for the American public. In order to better understand the mission, their role in it, and give it his or her full effort, they have to know what effect the operation is likely to have at the local, regional, national and international levels. The opportunity to involve themselves in educational and other activities is necessary to quality of life and morale. A well-informed service member is more effective.

5-7. The general public is interested in soldiers, their lifestyle, how they are being treated and their ability to accomplish a given mission. Information about these topics provide reassurance, confirming that soldiers maintain professional and ethical values and are being cared for adequately.

Historical Perspective

During Operation Desert Shield/Storm, many commanders developed innovative methods of sharing Command Information products produced in theater and in the rear. The products greatly enhanced morale at both ends. Some commanders and PAOs used the products as issue management tools to dispel rumors in theater and at home station. The products included field newspapers, newsletters, videotapes, audiotapes, etc. They also let soldiers returning from the area meet with family support groups to answer any questions.

(After Action Report 1991)

RESPONSIBILITIES

5-8. Commanders at each echelon are responsible for Public Affairs operations and support. Public Affairs officers and noncommissioned officers at various levels assist commanders in the discharge of these responsibilities. Public Affairs staffs are responsible for accomplishing the Public Affairs information communication mission. This responsibility includes Public Affairs operations in all subordinate, assigned or attached commands.

5-9. PA is only one of many information channels available to a commander. PA information provision cannot substitute for a commander's personal involvement in his "Command Information" program.

5-10. All public affairs practitioners have access to all information that is not classified or violates Operational Security or the Essential Elements of Friendly Information (EEFI) for use in preparing information products. Commanders must ensure the EEFI is up-to-date based on current situations and operational guidance. Public Affairs personnel at all levels

must produce and release accurate information packages based on DoD directives and Army policies.

5-11. **Strategic Level Commands** are responsible for providing public affairs guidance to subordinate units. They develop central themes and messages and provide umbrella guidance to subordinate PA staffs. They must also provide subordinate commands with information useful in preparing information products for internal and external release. They are additionally responsible for marketing public affairs information products to subordinate commands, home stations, the Army as a whole, as well as the general public. Strategic level Public Affairs staffs are the primary coordination point for the Armed Forces Radio and Television Service and the geographical manager for radio and television services including personnel, down links, facilities and equipment.

5-12. **Operational Level Commands** are responsible for communicating public affairs guidance to subordinate units. They expand on information campaign themes and messages, and provide additional information products to subordinate command PA staffs. Additionally, they provide subordinate commands with information useful in preparing information products for internal and external release. They are responsible for gathering and producing public affairs information products for release. In the event the Operational Command is the senior command in an area or theater, it assumes the responsibilities of the strategic level command.

5-13. **Tactical Level Commands** are responsible for gathering information products for release through their next higher headquarters to home stations, the Army as a whole, as well as the general public. These commands are also responsible for coordinating the dissemination of information and information products received from senior commands down to subordinate commands. In the event the tactical command is the senior Army command in an area or theater, it assumes the responsibilities of the operational-level command and will be augmented to accomplish these additional functions.

INFORMATION STRATEGY PROCESS

5-14. The Information Services Section uses all available means to gather complete, factual, unbiased information for use in information campaign development. The information is developed, converted into the most appropriate product form based on the information needs/target audience assessment and information communication channel availability, and then transmitted to the intended audiences. This is called the Information Provision Process.

5-15. Although the information strategy process follows a deliberate cycle, it is a continual process. Information campaigns are also conducted simultaneously, with personnel examining external and internal information needs, carrying messages from concept through execution and program evaluation, to accomplish specific PA objectives. The cycle has four phases -- acquire, process, protect and distribute. (See Figure 5-1.) Evaluation is a key component in the cycle. It must be conducted throughout the four phases. This ensures the campaigns are meeting their objectives, and are altered if they do not.

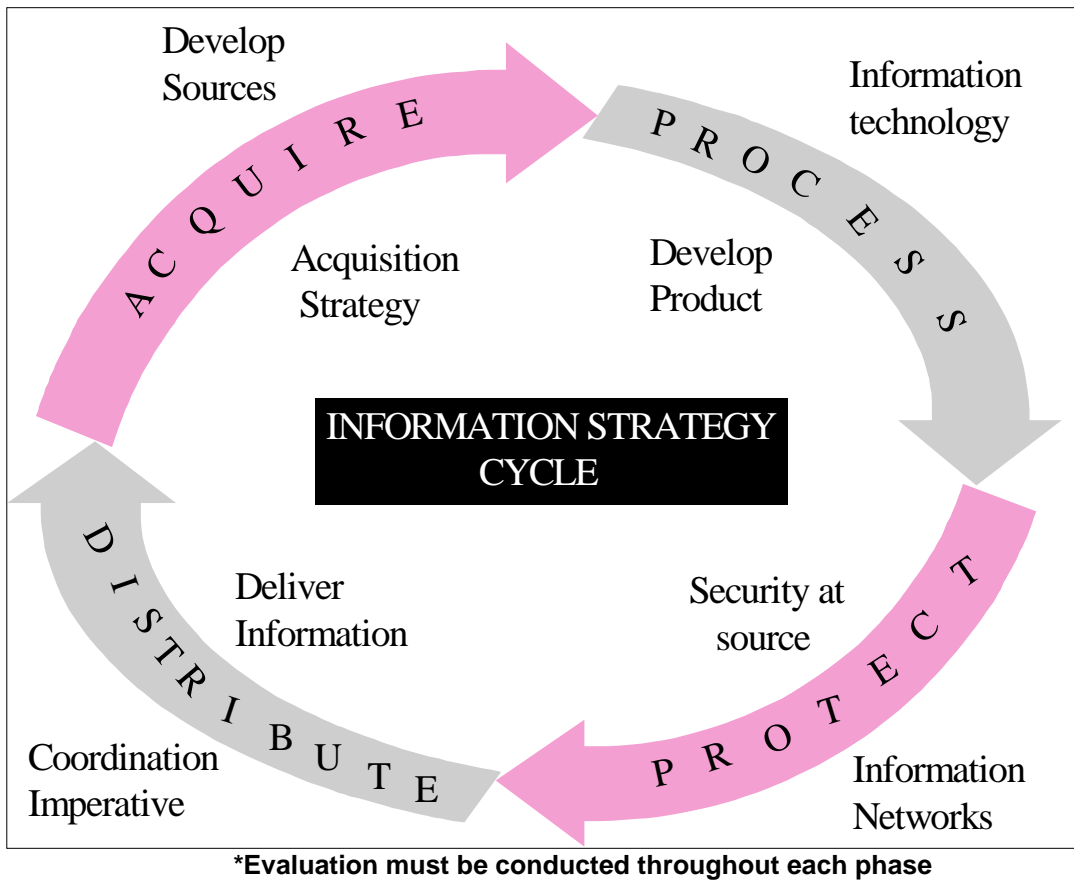

Figure 5-1

ACQUIRE

5-16. During this phase, a ISS identifies and assesses several factors: the situation, the environmental factors, the mission, and the target audiences. They determine the information needs of the various target audiences. They then begin to gather information based on the information requirements of these audiences.

- **Information Needs Assessment and Audience Analysis.** Identification of the target audiences and target audience populations and densities must be developed during the planning stages of operations with target audience assessments. Upon assessment of target audiences and consideration of which type of information product will best serve each audience, commanders must ensure adequate public affairs personnel, equipment (to include communications), resources and funds are available and included in OPLANS/OPORDS to achieve mission success. An assessment of soldier information needs is crucial to the information package development and the selection of appropriate products.
- **Information Gathering.** Information gathering is the first step in producing packages for release to internal and external audiences. Public affairs personnel gather information through

operational, administrative, logistical, battle, staff, command and support channels. They also acquire information through the media, research, leaders and the culture at large. Information may be obtained via electronic and telecommunication systems in addition to written documents and oral communications. While information often comes from superior and subordinate commands, it may also be obtained laterally.

- Sources of information must be valid and diverse enough to provide a broad overview. Public Affairs staffs must ensure the source does not speculate, nor speak out of his area of expertise. However, soldiers' experiences and personal opinions may lend credibility and provide a "grass-roots" view.

PROCESS

5-17. During this phase, the ISS begins to develop products, prepare them for release and determine methods for distribution.

- **Product Development.** Development of information products is performed to some degree by PA personnel at all Public Affairs levels and is an on-going process. The term "product," as used in this process, means the message for intended communication, regardless of the format or communication channel proposed. Initial production development may be command directed or initiated by the Public Affairs staff or provided by other Army agencies. The command's resources and the target audience's requirements will determine the product type.
- **Prepare products.** Information packages should be prepared in accordance with Public Affairs Guidance, Soldiers' Manuals, Field Manuals, SOPs and Army Regulations. Ultimately, the Public Affairs staff is responsible for content.
- **Media Forms/Methods.** Soldiers use a variety of technologies to gather information and produce information products. During the gathering process, PA soldiers conduct interviews, attend briefings, withdraw data from government and commercial computer databases, bulletin boards, and e-mail systems. They acquire text, graphics, photography and motion video from government and commercial Internet systems. The nature, distribution, usability and flexibility of public affairs systems are crucial in the processing of information.
- Professional quality systems should be used whenever possible. For printed products, preferred systems include computers, desktop publishing, word processing, laser printing, etc. Reproduction may be Army-contracted, Army-funded or reproduced using the command's assets. Video and audio products intended for release to news media should attempt to be broadcast-industry standard.
- Electronic newsgathering and editing systems should be used when available. Visual products should be generated by modern methods including digital imagery and computer graphics.
- **Print.** Articles released to home station for military publications and family support group publications; for marketing to civilian publications; field publications, e.g. newsletters, with and without photography.

- **Video.** Raw electronic news gathering video and printed news scripts for release to military and civilian outlets.
- **Audio.** Radio interviews; features; internal command information scripts; radio news; news reports for release to military and civilian outlets.
- **Visual.** Digital imagery; photographs; slides, view graphs; graphics for release to military and civilian print and broadcast media.
- **Digital.** Each of the categories described above may be developed and distributed electronically, either through commercial information services directly on the Internet, or by using tactical Army communications systems (SINCGARS and ATCCS). Modern technology in use on the battlefield has made digital transmission the preferred method for all types of products.

PROTECT

5-18. **Security at the source.** No information strategy is complete without a clear cut understanding of how to protect the information. Both sides can benefit from information and use information simultaneously against each other. Pieces of the right information can have a dramatic impact on the outcome of an operation. Public Affairs professionals will continue to protect vital information by practicing security at the source and following established operational security guidelines.

5-19. In addition to protecting the raw and completed information products, public affairs personnel must also take the necessary steps to protect information networks.

DISTRIBUTE

5-20. **Dissemination.** Public Affairs information packages should be released in the format most easily used by the recipient. While this is not always possible, a product stands less chance of being used if it is incompatible with the recipients' equipment. For example, a video product released on Hi-8 to a TV station that works exclusively with Beta SP has less a chance of being aired than a video story in a compatible format.

5-21. Public Affairs information packages must be expedited to the users by the most technologically advanced reliable method. Great consideration must be given to the speed and reliability of the mode of dissemination. This must be included in target audience assessments and conducted during planning stages of operations. Articles and photos may be sent from deployed locations to home stations via computer systems and telephone lines. Yet based on the quality of the telecommunications system, it may be more reliable to use the mail or a courier. As technology improves PA capabilities, Public Affairs will incorporate those improvements into the information gathering and dissemination system to increase its potential to reach an ever-growing, information-hungry public. For example, the emergence of smaller, more powerful satellite link ups can provide PA elements the ability to reach targeted audiences sooner and from more locations.

5-22. Internal information packages must be available to soldiers at all levels of command. Public Affairs must develop and coordinate a

distribution scheme with the commander, the general staff, and with signal as the proponent for physical distribution of certain commercial news and information products. An efficient distribution system will also ensure prompt delivery of public affairs products. The public affairs staff must conduct periodic quality control checks and update the distribution scheme as necessary, based on changing population densities or information products. Electronic means are the preferred mode of distribution, however additional methods include, but are not limited to contract delivery, AG distribution and the military postal system.

5-23. Products for distribution to deployed soldiers. Publications produced by other military agencies intended for deployed soldiers must be given the same distribution considerations as commercial information packages. For example Stars & Stripes, Soldiers Magazine, Army Trainer and home station post newspapers contracted for delivery to deployed soldiers must be given the same distribution considerations as other publications. However, a separate distribution scheme may be required.

INFORMATION PROGRAM EVALUATION

5-24. The final step in the Information Provision function is the evaluation of our communication efforts. Evaluating communications programs is research, which boils down to a series of questions:

- Did we achieve our objectives?
- Were our policies and programs effectively communicated?
- Was the operation affected positively by our efforts?
- Did the American public support our soldiers? Was unit cohesion enhanced?
- What audiences received our messages? What was the impact of our communication programs on these audiences?
- Research is the foundation of the Information Program Evaluation. Corrections and changes in courses of action should be based on solid factual information. Methods for conducting Information Program research are discussed in greater detail in Appendix P.

NON-HIERARCHICAL AND INTERNET

INFRASTRUCTURE AS A RESOURCE

5-25. Modern technology has provided us with an advanced form of communications structure called non-hierarchical structure. The advantage of non-hierarchical communication structuring is that every "node" in a communications web shares information with every other "node". Each node on a network can identify itself and "find" others in the network in order to communicate specific information. Public Affairs elements act as information nodes, gathering, developing and sharing information vertically and horizontally on the battlefield.

5-26. While this technology was originally intended for command and control, it is essential for other functions on the battlefield as well. Well-coordinated public affairs operations will leverage this capability to move information -- sending messages around the battlefield, to and from home station, and up and down the chain of command.

5-27. The end state of this technology effort is that both organizations and individual soldiers on the battlefield will possess this capability.

TELECOMMUNICATION SYSTEMS

5-28. Information technology provides the means to collect, process, display, develop and disseminate information in an unparalleled manner. This technology has begun to revolutionize our approach to information provision.

5-29. The PA specialist now has the ability to access desired information on a certain issue and tailor and develop this information into a message for dissemination -- all from a personal laptop computer.

5-30. This "from anywhere to anywhere" capability allows the PA specialist at all echelons to accomplish his mission of presenting the Army's perspective -- framing issues and informing targeted audiences.

5-31. There are two telecommunication systems available to Army PA specialists: DoD's internal secure communication network, known as the Defense Data Network (DDN) and the worldwide commercial information network -- Internet. PA specialists must be familiar with both.

DEFENSE DATA NETWORK

5-32. Defense link is an entry point to Internet sites operated by the Office of the Secretary of Defense, the armed services and related defense agencies. It provides a means to search and download Department of Defense directives, obtain transcripts of important speeches and connect to other sites dealing with specific military operations.

5-33. The Department of Defense organizations are extensively represented on the Defense Data Network. Each of the military services has a centralized directory of its Internet sites. Army Link, as its name suggests is a catalog or hotlist of more than 280 Army home pages. The sites are indexed alphabetically and by subject area.

INTERNET

5-34. The Internet is a network of networks. Originally, the Internet was developed by DoD with the goal of building a automation system linking government agencies together which would continue to function in case part of the network ceased to exist. From this inception, the Internet grew, as other agencies and activities noticed the benefit of linked telecommunications. The system now includes organizations from all segments of society: government, defense, business, education, health services, etc. There are more than 30,000 networks participating on the Internet and more than 150 million individual users. And more are connecting everyday.

5-35. Army Public Affairs personnel have access to the Internet through their local Directorate of Information Management (DOIM).

5-36. On the Internet, there are six main activities: "Hypertext" documents with multimedia links on the World Wide Web can be viewed, files can be downloaded with a file transfer program or "FTP," data can be located, communication via e-mail, reading and posting messages to

news groups and bulletin boards, and logging in to remote computers using Telnet.

5-37. You can do most of the same things in the Internet that you can do on any of the commercial information services, but you do them in the context of a much larger network that isn't centrally organized or controlled.

5-38. **World Wide Web.** The World Wide Web, also known as WWW, W3, or simply the Web, is one of the most popular activities on the Internet. The Web allows you to view documents that feature graphics, "hypertext" (text which contains highlighted keywords which are linked to other documents or information sources available on Web) and multimedia links. The hypertext and multimedia links are tied to other documents or information forms that might be on the same computer, one across the country, or a machine on the other side of the world.

5-39. The WWW contains thousands of main menus, called "home pages" which identify the various sub-categories at each web site. Web users can search using key words or locations through the lists of home pages for specific web sites.

5-40. **Gophers.** A gopher is a menu driven system that offers text only. Users of the web can access gopher sites and retrieve information. It is a predecessor of the Web.

5-41. **News groups.** They are discussion groups built around a particular topic. Some are managed, others are not. News Groups take two forms: Mailing List: A list of E-mail addresses to which messages are sent. You can subscribe to a mailing lists typically by sending an email to the contact address with the following in the body of the message: the word subscribe, the name of the list, and your email address. Discussion groups: A particular section within the USENET system typically, though not always, dedicated to a particular subject of interest. Also known as a newsgroup. USENET is a collection of the thousands of bulletin boards residing on the Internet. Each bulletin board contains discussion groups, or newsgroups, dedicated to a myriad of topics. Messages are posted and responded to by readers either as public or private E-mails.

5-42. **E-mail.** E-mail is a means of interpersonal communication that falls somewhere between the immediacy of a phone conversation and the more thoughtful but slower exchange of ideas previously done by writing letters and memos. The specifics of using it vary greatly according to the mail software being used.

5-43. **Commercial On-line Information Services.** Users cannot directly dial up to the Internet using a modem, but must gain access through an internet service provider. Many offices, universities and large businesses provide access for their employees. For access at home, a user can either subscribe to one of the commercial on-line services, which provide Internet access in addition to their other features or to one of the dedicated Internet server companies located in most cities.

Chapter 6

Training

"You must remember that whether you wear one stripe or six, one bar or silver eagles you automatically become an "Army spokesman" when you are approached by the press. Within 24 hours the words of that Army spokesman can be flashed world wide, particularly if they can be construed as criticism..... Everything you say should have the ultimate aim of furthering that effort. Your approach to the questions of the press should emphasize the positive aspects of your activities and avoid gratuitous criticism. Emphasize the feeling of achievement, the hopes for the future, instances of outstanding individual or unit performance and optimism in general. But don't destroy your personal credibility by gilding the lily. As songwriter Johnny Mercer put it, "You've got to accentuate the positive and eliminate the negative."

- U.S. Continental Army Command memo to advisers in Vietnam.
The Military and the Media,
William M. Hammond, 1988

TRAINING OBJECTIVES

6-1. The cost of learning in combat is too high. Therefore, commanders and staff section chiefs must conduct cost- and time-effective staff training during peacetime. In order to conduct effective training, every consideration regarding PA activities should be evaluated.

6-2. Evaluation should include, but is not limited to, analysis, planning and execution of the operation. The PA staff, in conjunction with other members of the organization, must train in the initial planning of the operation. In order to train effectively, the following considerations should be evaluated:

6-3. **Analysis.** Specified and implied tasks are identified at home station for deployment, mission and redeployment requirements.

- Feasibility of all tasks are determined and assessed.
- Consider any PA guidance issued by higher headquarters and determine specialized training requirements.
- Consider all phases of host nation operations and the effect on your operation and organization.

- Determine the availability of required assets and equipment for all phases of the operation.
- Consider the availability and use of internal and external assets -- joint, RC and combined -- to augment known shortfalls.
- Determine any transportation requirements for your organization or attached personnel.

6-4. **Planning.** Planning includes PA annexes, command directives, DOD guidance, regulations and directives stipulated by the commander's intent and mission requirements.

- PA annexes should contain a brief, general description of the situation and intent to conduct operations.
- Planning should also consider enemy forces and host nation personnel and their relationship to the operation.
- PA planning should be considered for all attachments and detachments currently known or listed under the task organization. This includes planning for assets and requirements from home station to redeployment.
- Training should be conducted emphasizing procedures for handling the transmission of all information. Theater-unique requirements may call for special training scenarios.
- All logistical and administrative requirements need to be addressed in the planning and training process.

6-5. **Execution.** The staff, soldiers and media understand the commander's intent in terms of his command position and operational mission. The operational area ground rules are included in the PAG and are widely disseminated throughout the organizations.

- Encourage local media to accompany deployed units.
- Adequate vehicles have been identified and assigned to transport PA personnel and media throughout operational areas. This includes vehicles, aircraft and available transportation assets for transporting all media personnel and products. Consideration of transportation should include all support activities in the forward area of operation.
- Public Affairs personnel in the media center will prepare releases of specific events to disseminate in the area of operations. News media inquiries are anticipated, received, researched and answered as quickly as possible.
- Local security review policies are clear and will not delay the transmission of information.
- Executions of the theater policy for registration policies and local media pool operations have been completed. Non credentialed media are identified and escorted to the rear for registration. Once registered, media personnel will be allowed to cover stories and interact with organizations in the area of operations.

6-6. The staff section must be able to:

- Cope with the unexpected. For example, media arriving at the unit level without PA escort or media not registered with the joint media operations center.

-
- Separate fact from fiction. For example, media having misinformation which they believe as fact and trying to confirm it.
 - Coordinate well amid confusion. For example, be able to access the PA staff at the MOC.
 - Think clearly while under great stress. For example, have a unit PA representative (UPAR) who will handle escorted/nonescorted media for the unit.
 - PA elements develop training plans from assessments of their performance proficiency on their METL.
 - Detailed training plans for Public Affairs Detachments are contained in ARTEP 45-500-10-MTP, for the Mobile Public Affairs Detachment in ARTEP 45-413-30-MTP and for the PAOC, ARTEP 45-326-50-MTP.
 - The training plans in those documents can be readily adapted to train other types of PA elements, such as a division PA staff.

PRINCIPLES

6-7. All PA training must be based on the training principles in the FM 25-series:

- **Train as combined arms and services team.** Do not train in a vacuum. Train with the unit you support.
- **Train as you fight.** Conduct realistic training. PA leaders must move soldiers out of the office and into the field to conduct training, including joint and combined operations. Set up a media operations center and conduct operations for a day.
- **Use appropriate doctrine.** All PA leaders should be familiar with FM 3-0 (100-5), *Operations*; FM 3-13 (100-6), *Information Operations*; and the PA manual, FM 3-61 (46-1), *PA Operations*.
- **Use performance-oriented training.** Performing tasks under field conditions with appropriate evaluation enables your soldiers to perform better under actual conditions.
- **Train to sustain proficiency.** PA units must take advantage of all training opportunities to sustain proficiency, participating in all CPXs, FTXs and deployments that their supported units are involved in.
- **Train to challenge.** Training for PA tasks must create the kind of pressure PA soldiers will face in actual situations. Ensure it is challenging but realistic.
- **Train using multi-echelon techniques.** The entire PA chain-of-command must participate in training for it to be realistic and effective.
- **Train to maintain.** Soldiers and leaders must keep equipment in a high state of readiness in support of training and for deployment.
- **Make commanders the primary trainers.** The unit commander is the primary training manager for the unit. The commander assigns primary responsibility to officers for collective training and to NCOs for soldier training.

TRAINING OPPORTUNITIES

6-8. Regardless of type, size or configuration, PA elements/units must train with the units they support. PA leaders must evaluate the ability of their units to support their real-world missions successfully and determine areas of weakness.

6-9. PA leaders must determine what training opportunities they can participate in realistically and coordinate for support from higher headquarters. If support is not provided, then unit leaders must create their own unit training program that simulates the tasks they will be asked to do when deployed.

6-10. For example, PADs should deploy with brigades to NTC or JRTC to practice their unit mission and capabilities and be evaluated accordingly. If the PAD is tasked with garrison duties, these duties must be retasked to allow the unit to train and maintain.

6-11. PA elements and units should take advantage of the excellent training opportunities offered by the JRTC and NTC. Both centers conduct media-on-the-battlefield training for visiting maneuver units. Public affairs elements should accompany the maneuver brigades and establish field media centers to take maximum advantage of these resources. It is imperative that PA elements be able to function effectively in austere environments. They cannot perform to their maximum capability unless they train accordingly. The key is repeated, tough, realistic training.

Historical Perspective

An initial PA team was sent to Somalia to set up a media operations center in December 1992. Mogadishu at the time was a war zone with many fronts. Initially, U.S. forces set up operations at the airport. Under the constant roar of C-5s, the PA team tried to organize a MOC. They had a very difficult time dealing with the lack of power and water. Eventually they were able to set up in a schoolyard. A “JIB-in-a-box” arrived with computer equipment, but it was all 220-volt — power in Somalia is 110-volt.

For the duration of the operation, personnel at the MOC learned to live and work under austere conditions, where food, water, power, and communications were constant problems. They eventually were able to set up a briefing room with benches, an old couch and a bulletin board for posting media opportunities, and conducted media operations under austere conditions.

(After Action Report 1992)

6-12. Home station CPXs and FTXs are fundamental training events that provide PA elements relatively low-cost opportunities to practice the full spectrum of wartime PA tasks on a reduced scale.

6-13. A visit by even a single reporter can be used to exercise a broad range of media support tasks including establishing a field media center; arranging interviews; preparing subject matter experts, individual soldiers and commanders to meet the media; preparing fact sheets; responding to media queries; registering media; arranging escorts and transportation, etc.

PA TRAINING FOR NON-PA AND PA PERSONNEL

6-14. Public affairs training is not limited to training for PA soldiers. PA elements/soldiers also have a responsibility to train non-PA soldiers and family members in military/media relations. Organic PA elements must develop training programs for their supported units. These can take the form of classes as well as pre-deployment briefings for units and family members.

6-15. Training for commanders and subject matter experts. Unit commanders and individual subject matter experts must be prepared to be interviewed. It is a PA responsibility to ensure they are familiar with the ground rules and know to restrict their statements and comments to their area of expertise. Details on how to do this are contained in the Soldier's Manual task, "Prepare a Spokesman to Address the Media," #224-176-4013.

6-16. Training for unit soldiers. Individual soldiers must be advised of the inevitability of media presence during military operations. Classes for units can be part of sergeant's time training and consist of teaching soldiers what they should and should not talk about when meeting the press. All soldiers should be encouraged to represent themselves as soldiers and encouraged to speak about the jobs they perform for the Army.

6-17. Training for family members. PA training for family members consists of educating them on their rights and responsibilities when interacting with the media. Family members often know more about specific operations than should be revealed to the media. They must be advised not to discuss information, which may be used by the enemy against their spouse's unit, such as details about troop movements, destinations, missions etc. They must also be advised that they have the right to refuse to talk to the media. Family member briefings should be a standard element of pre-deployment family support group activities.

6-18. Basic soldier skills. Public affairs soldiers are soldiers first and public affairs practitioners second. It is imperative they are well trained in basic soldiering skills. Public affairs elements and units must make time to train to standards on common soldier tasks that allow them to effectively shoot, move, communicate and survive on the battlefield.

6-19. Readiness. All PA elements and units must have, and exercise, detailed load plans. Soldiers should be aware of the importance of maintaining all equipment and vehicles in a state of readiness for deployment.

6-20. PA NCOs must ensure soldiers participate in preparations for overseas movement (POM) so they are administratively and medically prepared for worldwide deployment. Soldiers should be aware of the importance of wills, shots, powers-of-attorney, personal data and allotments.

6-21. Staff Section and Unit Training. A state of operational readiness to conduct combat or non-combat operations must be attained and maintained. This level of readiness is accomplished by preparing individuals, shifts and staff sections to perform assigned tasks and other duties at the desired standard of proficiency in advance of assigned operations.

6-22. Standards of performance must be set so the section can evaluate its performance. Examples of these standards include:

- Understanding DOD's policy statement -- Commanders will ensure maximum unrestricted disclosures of unclassified information to news media representatives consistent with operational security, guidance from higher headquarters and the privacy of individuals concerned.
- Escorted and unescorted media -- If the media has a PA escort, you may agree to an interview after the escort explains some basic ground rules. If not escorted, ask media personnel to accompany you to the command post, NCOIC or OIC and contact higher headquarters/public affairs officer.
- Conducting an interview -- Military personnel have the right to deny media interviews. If a soldier elects to provide the media with an interview, he should only discuss those things which he has direct responsibility or personal knowledge, and ensure an escort (PA or non-PA) is present. See Appendix N for more details.

THE INTERVIEW PROCESS

6-23. The Interview Process:

- Prepare for the interview. Consider the type of questions the media will ask, and think what your answer will be. When possible, ask for PA assistance (UPAR or PA personnel).
- Relax and be yourself. Imagine that the reporter is someone you know and talk with him in a relaxed manner.
- If cameras are present, ignore them and talk directly to the reporter. Be brief and concise. Remember, a TV news story will use only 10- to 15-second answers.
- If you need time to respond, ask the reporter to restate the question. A simple pause before answering the question is sufficient.
- Use simple language and avoid military jargon (i.e., military abbreviations or acronyms). If you must use military terms, explain what they mean.
- Use appropriate posture and gestures. Relax and be yourself.
- Answer only one question at a time. If asked multiple questions, answer the most important one first, or answer the one you're most comfortable with.
- Always try to end your comments on a positive point. This is your opportunity to tell your unit's story.

6-24. Things not to do:

- Do not allow media to videotape recognizable landmarks nearby, sensitive equipment, interior of tactical operations centers or other sensitive areas. Use OPSEC as guide on this matter.
- Do not answer speculative questions or give opinions concerning real or hypothetical ("what if") situations.
- Do not use the expression, "No comment." A more appropriate comment would be, "We don't comment on future operations." or

"I'm not qualified to respond to your question." or "That information is classified, so I can't discuss it."

- **Never** lie to the media.
- Consider everything you say to the media as "on the record." **Never** make "off the record" comments.
- Don't lose your temper when media representatives ask questions you consider inappropriate or foolish. Such questions are usually rooted in ignorance rather than in malice.
- Do not discuss operational capabilities, exact numbers or troop strengths, numbers/types of casualties, type of weapons systems or future plans. Use general terms like approximate, light, moderate or heavy.
- Don't repeat a negative phrase in response to a media representative's negative question (e.g., Q: Since your unit is poorly trained, can you really deploy? A: We're well trained and ready to go.).
- Staff section and unit training should be integrated into headquarters FTXs and CPXs in order to perform adequately within the unit's operational staff during real-world missions.

TRAINING EXERCISES

6-25. Training exercises will vary from major FTXs to CPXs and Tactical Exercises Without Troops (TEWTs). Each training opportunity provides the staff element realism, the opportunity to experiment and the ability to face situations. These challenging training exercises enable soldiers and units to tell the Army's success stories.

6-26. Training exercises also enable the commander and staff to:

- Emphasize the tactical SOP.
- Execute plans in a dynamic, hostile environment.
- Exercise bold solutions.
- Exercise contingency plans.
- Experience possible defeat without the penalty of combat loss.
- Work toward goal-oriented performance standards by team building while providing PA support.
- Training exercises also allow PA personnel to become operationally, strategically and culturally aware, and puts them in a unique position to interface with the news media personalities which shape the perceptions of our national and international audiences.

TRAINING FOR MEDIA FACILITATION

6-27. Facilitating media in the military environment includes three phases -- planning, preparation and execution.

6-28. **Planning.** The Media Operations Center receives requests for registered media to visit units in their areas of operation. The MOC will contact a unit and coordinate the time and location for the visit, as well as notifying a PA or nonPA escort for a mission. The escort will need to know the unit's location and whether the unit's UPAR (if applicable) will travel with the group or meet them at the unit. The unit will need to

know the number of media visiting, the duration of the visit and the status of the unit for the last 24 hours (i.e., has the unit been in contact with the enemy and has there been any significant actions).

6-29. The escort will plan the route to the unit. The number of media going will determine the number of escorts and vehicles needed for the trip.

6-30. **Preparation.** The JIB or escort will notify the media and tell them the time and location of departure and estimated time of return. This allows the media to plan for their supplies and equipment for the trip. The escort should meet with the media and update them on the unit's status, find out if the media has any specific requests before departing, cover safety points and OPSEC requirements, and ensure they have everything they need. This will also provide the escort with a direction for the types of questions or issues the media may address. The information concerning the unit's situation will allow the escort to develop a list of Q&As for the commander and individuals whom the media will interview.

6-31. The escort should meet with the drivers and review the route to the unit, cover contingency plans and determine an inspection time before movement. The escort should also contact the unit to reconfirm the visit and their location, as well as providing a list of the names and agencies of media visiting them. The escort should meet the media at the vehicles to insure they have what they need for the trip.

6-32. **Execution.** The escort should leave as scheduled and travel as the tactical or non-tactical situation dictates.

6-33. When arriving at the unit, the escort should have the driver park the vehicle as directed by the unit and have media personnel wait at the vehicles (if possible, with military supervision). The escort needs to request that the media not take photographs of the unit's position for operational reasons. Let the media know you are going to get the commander and will return as soon as possible. If the situation is hostile, get the media inside the perimeter and secure them away from equipment and the command post.

6-34. The escort should meet with the UPAR and let him/her know who is in the media group. Ensure that the unit will be able to provide the interviews the media requested.

6-35. The escort should brief the commander and let him know the ground rules, covering possible Q&As. Answer any questions or concerns he may have about the interview. Let him know that you will be present during the interview to assist him. When possible and if mission requirements permit, the commander should be available for the media. Review the unit's OPSEC requirements to ensure you understand what cannot be photographed.

6-36. The escort should determine where the commander wants to meet the media. If the area is not appropriate for conducting interviews (may be based on PA experience or media request), provide an alternative recommendation to the commander.

6-37. The escort should move the media to the interview point and introduce the commander to the group. After the interview, the escort should facilitate the rest of the coverage with the help of the UPAR. Do not allow the media to linger in the area of operations and become

mission detractors. Wrap up the visit, return to your vehicles and depart. Upon returning to the JIB, the escort should be available to back brief the PAO.

6-38. The requirement to maintain proficiency in the full range of public affairs collective and individual capabilities and skills places a high priority on tactical training for both AC and RC PA soldiers. Tactical training participation enhances knowledge of battlefield requirements, increases unit cohesion, and forms the basis of experience needed for operational planning, mobilization, deployment and mission success.

6-39. PA will continue to face expanded missions in the joint arena. Quality PA training provides sufficient numbers of trained PA personnel to conduct joint and combined PA missions. Training must emphasize the joint perspective, enhance interoperability, and contribute to each combatant CINC's PA Mission. Exercise participation is critical to the training of PA personnel.

6-40. Trainers must fully incorporate a broad array of PA activities into all types of exercises and war gaming. These activities can be injected into computerized battle simulation as the training exercise driver. They should also be used in BCTP command post exercises, and JRTC, CTC, and NTC rotations. Seminars, area assessments and TEWTs are all forms of training that also provide relevant, realistic training.

Chapter 7

Community Relations

Public opinion about the Army is greatly influenced by the actions of each command. What the command does for its local community or fails to do affects the perceptions and attitudes of the American people, upon whom the Army depends for its support and existence. This applies not only to official acts but also to unofficial acts, which by their commission or omission affects public opinion. This principle also applies to individual members of the Army, their dependents and Army civilian employees in their personal contacts with the civilian community. Conducting community relations is a vital element to successful public affairs operations. Commanders and public affairs officers (PAO) must seize on key opportunities to gain and maintain links to internal and external publics.

EFFECTIVE COMMUNITY RELATIONS

7-1. PA personnel act in concert with veteran's groups, civic leaders and local populations to increase understanding and build support for Army activities. Army support to and participation in public events is based on the fact that the Army belongs to the American people. Common ownership requires that Army resources be used to support events and activities of common interest and benefit.

7-2. Effective community relations requires:

- Command supervision at all levels.
- Appreciation of public opinion and attitudes toward the Army
- Planning definite actions and positive policies.
- Implementing programs in a competent, professional and responsible manner.
- Constant evaluation of continuing programs to measure their effect upon the public and the command.
- Sharing the results of the program.

7-3. Commanders must maintain continual liaison with persons and organizations in the local community to help resolve common problems and develop cooperation and understanding between the installation and

the local community. Community relations develop an effective two-way channel of communication between the Army and the community. PA does this by capitalizing on opportunities for better relations and resolving potential and actual areas of conflict.

7-4. Community relations projects or programs may be supported by use of exhibits, equipment and facilities. Exhibits consist of displays such as mission exhibits models, devices and other information and orientation materials at conventions, conferences, seminars demonstrations, exhibits, fairs or similar events. Also included are exhibits displayed on military installations during open house programs.

COMMUNITY RELATIONS ACTIVITIES

7-5. The goals of community relations is to develop an open, mutually satisfactory, cooperative relationship between the installation and the community. A successful community relations program improves the community's perception of the Army and its appreciation for the installation and the soldiers, family members and civilians who are part of the installation. It is based on openness and honesty. Community relations objectives are community assistance and social improvements for the community in which the military must work and live.

Historical Perspective

Fort Eustis, Va. started a pilot program in 1992 called Operation Self-Enhancement to give high-risk middle school students the opportunity to visit the post and focus on careers, teamwork and self-esteem. The program was so successful that it has become an annual event. Students receive light military training through an array of testable tasks and obstacles presented by members of a cadre team. This training helps students build their self-esteem and self-confidence and affords them the opportunity to interact with positive role models. This also gives the students a better idea of what the Army is about.

7-6. Community Relations activities include:

- **Speakers Bureaus.** Speakers are an effective means of developing understanding of the Army, stimulating patriotic spirit and informing the public about the activities of the installation, its units and its soldiers. Commanders should establish an installation speakers bureau and encourage soldiers of all ranks to participate in the installation program.
- **Community Liaison.** Maintaining liaison through informal community relations councils can establish and maintain open communications with community officials and organizations. Councils can be charged with a variety of responsibilities, such as developing and promoting new ways for members of the command to actively participate in local community activities, capitalizing on opportunities for better relations and resolving potential and actual areas of conflict. Community liaison can also involve recognition of private citizens, local community leaders and citizen groups and organizations for their support of the Army by public service awards. Commands can further community liaison through membership in civic, business and professional organizations when

the goals and objectives of those organizations are beneficial to the Army and their programs and projects are consistent with Army interest.

- **Ceremonial Units.** The band, color guard and other ceremonial units participating in public events are excellent ways to accomplish community relations objectives. These representatives of the Army serve as ambassadors to the civilian community and promote patriotism, interest in the Army, and awareness of the professionalism of our forces.
- **Exhibits.** Exhibits and displays of Army equipment, historical materials, models, devices and other information are other community relations activities that can enhance understanding of the Army and the installation. They provide an excellent opportunity for interaction between our soldiers and members of the local community and can communicate the professionalism, readiness and standards of our forces.
- **Open House.** Open houses may be scheduled to coincide with Armed Forces Day, the Army Birthday, service branch birthdays or anniversaries which mark the history of the installation, a unit or community events or in support of media day. An Open House gives the local community an idea of who we are and what we do. They also have the opportunity to visit us on the installation-- at our job site.
- **Physical Improvements.** Community service physical improvements focus on ensuring that the physical infrastructure is as safe as possible and provides the fullest possible range of support to the population. These activities encompass a wide range of programs that do not compete with the services provided by contractors and businesses in the local civilian community.

7-7. Some examples of physical improvements are:

- Construction projects that enhance the recreational, educational, environmental or cultural facilities of the community, such as building community picnic areas and hiking and biking trails.
- Demolition projects that enhance the safety and appearance of the community, such as the removal of unstable playground equipment.
- Projects that create or enhance a safe, clean environment, such as the removal of debris from a community wildlife area or painting a community recreation center.

TOWN HALL MEETINGS

7-8. Town Hall meetings provide installation commanders with an unfiltered means of communicating ideas to internal and external communities. This tool for conveying important information and ideas about the command cannot be underestimated in its effect and should not be planned haphazardly.

7-9. Commanders, PAOs and staff directorates must work together to produce an effective community relations product.

7-10. Prospective town hall meeting planners must understand, and properly apply, the correct type of town hall meeting. With a focus on the

type of meeting and probable audience, the planner can begin the process of planning and conducting the event.

7-11. As part of the plan, the planner must determine the likely audience for the meeting, including attendees from internal and external audiences. He must also evaluate possible attendance by key publics. The planner should develop a standing operating procedure (SOP) to ensure each mechanism of the process is in place for the scheduled event.

7-12. Finally, post-event analysis is imperative to accurately assess its effectiveness.

7-13. The PAO must develop systems to quickly assess the feedback data and activate a follow-up plan that will maintain confidence from the community that town hall meetings are meaningful events.

TYPES OF TOWN HALL MEETINGS

7-14. Installation commanders can stage various types of town hall meetings. The commander must determine which meeting type, or hybrid, is appropriate for disseminating information and gaining useful feedback from internal and external publics.

7-15. The following meeting program structures have inherent strengths and weakness; knowing the potentials for message delivery will assist the commander in making his decision:

- **Commander - Expert Format:** This meeting (Figure 7-1), is characterized by the commander attending with key staff members facing a live audience. Typically the commander and his staff will give presentations and then field questions from the audience. Usually, attendance is open to the public.
- The primary advantages to this format center on the open nature of the meeting.
- This meeting provides the commander with an opportunity to provide detailed presentations with time being a minimal constraint. He also receives instant feedback from the types of questions from the audience and the passion with which questions are asked.
- Meetings in this format are likely to be seen as the most easily accessed by the internal and external publics.
- Among the disadvantages of the format is the ability to reach large audiences and control the conduct of the meeting.
- Unless the meeting is taped for later airing on the commander's cable access channel, the audience is often narrowly focused.
- Although the possibility exists that large audiences will attend, it is also possible small or narrowly focused audience will limit the general effect the commander seeks.
- An open meeting can also become the forum for unruly or disgruntled audience members to incite others or attempt to draw the commander into an open confrontation.
- This factor can be mitigated through the use of question time-limits and use of a moderator (other than the commander), but cannot be

totally eradicated. (As with any other public event, security must be a consideration in the planning process).

Figure 7-1. Commander Expert Format

7-16. Commander Access TV Channel Format: This meeting format (Figure 7-2) uses the commander's cable access channel to air the event. Normally, the commander, CSM and Garrison Commander (and other staff members as necessary) give a presentation. No live audience is in attendance. The commander provides a set of phone numbers, allowing questions to be called in. The staff operates the phone bank, accepts the questions, directs the questions to the appropriate staff agency, and delivers the answers by 3x5 card to the on-air panel. The panel members read the questions/answers to the viewing audience.

7-17. This format offers advantages focused on control and distribution of the product. The venue and the setting are completely controlled by the commander and his staff. The staff screens questions and, thus, no surprises will occur. Indeed, if questions/answers are given to the commander, he may choose to either not answer or return the card for more information.

7-18. Other advantages include an ability to re-run the meeting as often as desired and provide copies to local cable providers, many of which are interested in using the product for airing.

Figure 7-2. Commander Access TV Channel Format

7-19. Disadvantages to this format center on a difficulty in gauging feedback, competing for viewing audiences on television, and providing personal contact with the commander. With no attending audience, collecting feedback data is problematic. Follow-up questionnaires, using statistical probability methods, provide the only means of gaining reliable feedback. The likelihood of viewers to "channel-surf" is high due to the specific nature of questions from callers. Holding the interest of viewers, all of whom have multiple other viewing options available, is difficult. Finally, by appearing on television, in uniform, with a phalanx of staff members, the commander risks appearing to be speaking from "the mount." Audiences may view the commander as speaking down to them and being out-of-touch to their concerns.

7-20. Key members from the internal and external publics form a roundtable discussion (Figure 7-3). The topics are set by published agenda, with some time left for open discussion. The meeting results are published for general distribution. Media are usually invited as participants.

7-21. Roundtable discussions with key publics offer advantages to the commander by providing information to the individuals who represent overlapping and wide constituencies. By setting an agenda, the commander can deliver focused messages with a high likelihood of the messages later reaching targeted audiences. It allows the commander

and potentially key staff officers to deliver presentations and provide follow-up information to those in attendance.

Figure 7-3. Roundtable Format

7-22. The principal disadvantage is the distance between the commander and the publics. The publics will receive information about the meeting second-hand and in a potentially filtered state. Gaining feedback may also prove challenging (but not necessarily impossible). Other disadvantages may be in the limits of the audience makeup; key publics, which are not invited, may resent the slight.

7-23. Commander-in-the-round format. A room is set-up that will allow the commander to be in the middle of all the attendees. Normally, he will stand and walk around in the circle formed by attendees. The meeting is usually open to the public.

7-24. The primary advantage to this format is the close contact the commander shares with his audience. Audience members may feel that barriers are lowered because the commander is close in proximity and no staff members are buffering their access. The commander also can realize feedback very quickly and can gain some appreciation for the resonance of his ideas with the assembled audience.

7-25. Such closeness with the audience can also be a significant disadvantage. Limiting surprises and controlling potentially unruly audiences is extremely difficult in this format. Further, because of the commander's reliance on his personal notes and memory, his ability to provide detailed information and multi-media presentations may be restricted.

7-26. Mitigation against such limits is dependent on the site design. Other disadvantages include problems associated with other "open" formats, including a possibly non-representative makeup of the audience.

7-27. Before deciding on which format is appropriate for the information, the commander must have a plan for what must be achieved.

7-28. Characteristics of an effective plan:

7-29. Answers the “why?” questions. The planner must understand the purpose of the meeting to correctly advise the commander on the format and substance to begin coordination of the plan. As described above, the various formats each have strengths and weaknesses that will assist the planner to shape the meeting.

7-30. Routinely Scheduled. Normally, meetings can be scheduled quarterly or monthly. Use the installation planning cycle to ensure proper coordination and notification of public meetings.

7-31. Site Plan. Checking and securing a site for the town hall meeting is dependent upon the type of meeting selected. Plan for the site early in the process and establish the layout of the site in detail.

7-32. Calendar Check. Before scheduling events, check local and regional calendars for possible conflicts. For example, scheduling a meeting on the same night as the local high school homecoming football game may prove disastrous.

7-33. Presentation Submission Deadline. Coordinate with appropriate staff agencies responsible for preparing presentations. Ensure presentations are properly staffed and approved. As PAO, establish a firm submission cut-off date.

7-34. Focused Presentation. Inform the staff of the commander's intent for the meeting. If the commander wants a particular theme addressed, ensure staff agencies adhere to the parameters of the intent.

7-35. Media Invitation List. Invite local and regional media including print and electronic outlets. Develop relationships with individual reporters and provide background material as necessary. (Local newspapers, radio stations and television stations can often assist in publicizing meetings as well).

7-36. Publicity Plan. Ensure all available avenues are used to publicize meetings. Included in this process are the post newspaper and radio station (where available), normal distribution, staff meetings, E-mail delivery and chain of command communications. Take special care to invite key publics by individual invitation and phone call follow-up.

EVALUATING FEEDBACK

7-37. Assessing the effectiveness of town hall meetings is essential to developing community-related policies and courses of action for the command. PAOs can use standard statistical measurements using survey techniques to gauge the level and intensity of views of the various publics. Other analyses can be derived from follow-up media content analysis, letters to the commander and post newspaper, and reactions at the meetings. None of the methods described here will render a perfect picture. PAOs must exercise good judgment and personal insight when advising the commander of analytical results.

7-38. **Response Follow-up.** Investigating and responding to issues raised at town hall meetings are critical to public perceptions of the level of care the commander applies to community operations. Just as a

maneuver commander sees battle damage assessment (BDA) as crucial to determining the efficacy of fires, commanders and PAOs must determine the true productiveness of community relations programs. Commanders will often feel compelled to promise action, such as investigation or immediate problem resolution, during a meeting. Staff agencies are normally the conduit for actions (only occasionally will the commander personally provide the requisite service).

7-39. PAOs should provide the staff oversight of the response mechanism. PAOs can devise a recurring memorandum that provides the commander (usually through the chief of staff), details about the status of actions. All staff agencies should receive updates routinely.

7-40. Along with the response mechanism, PAOs can use command information and media relations channels to inform the public of problem resolutions. For example, if an issue raised at a town hall meeting indicated that the local recreation center was routinely opening two hours late each day, describe the measures taken to alleviate the problem. The PAO can use the post newspaper or radio station to provide lists of problems and resolutions.

CONCLUSION

7-41. Community relations and activities are vital to instilling and maintaining the confidence of internal and external publics in our great Army. Commanders and PAOs cannot leave the prospect of successful relations to chance. Too much is at stake. Careful selection of the type of town hall meetings to be used must be taken. The event must be planned with the attention to detail required for all military operations. Each part of the plan has unique importance and cannot be overlooked. To ensure the effectiveness of the operation, PAOs are compelled to build a clear mechanism for evaluating outcomes. Finally, the command must provide conspicuous follow-up responses to issues raised to complete the process. Town hall meetings provide an excellent opportunity for commanders and the various publics to interact and improve community institutions.

COMMUNITY ASSISTANCE

7-42. Community assistance applies the skills, capabilities and resources of the needs and interests of the local community. Providing support for and participating in events and activities which are beneficial to both the Army and the community, builds on a long tradition of "America's Army" helping American communities. Identifying opportunities, which advance the interests of both the Army and the community, is an important objective for every commander.

7-43. Community assistance projects and operations must impact positively on the unit or individual soldier, enhance unit or individual readiness and contribute toward the common good of the community. Army commanders must ensure that their initiatives are not competitive with local resources or services and do not benefit any particular interest group and will not result in monetary or service remuneration in any form for unit members or the unit as a whole.

7-44. Increasing public awareness and understanding of the Army, inspiring patriotism and enhancing the Army's reputation as a good

neighbor is a goal of community assistance. Community assistance activities can help build unit morale and esprit de corps. These activities also provide an excellent opportunity for soldiers to serve as role models, which not only enhances recruiting efforts, but also serves to motivate soldiers by promoting their self-esteem and furthering their sense of service to the nation.

READINESS ENHANCEMENT

7-45. Certain community assistance activities enable a commander to train soldiers, enhance individual and unit readiness, maximize use of assets and foster a positive training environment where soldiers can become involved in realistic, “hands-on” training opportunities. Projects should be selected which exercise individual soldier skills, encourage teamwork, challenge leader planning and coordination skills, and result in measurable, positive accomplishment. Finally they should enable a unit to exercise use of its equipment, resulting in training opportunities that can generate greater operator efficiency for future missions.

7-46. Examples are:

- **Medical Readiness Program.** The Medical Readiness Program is an activity in which Army medical unit personnel, together with state medical emergency officials, plan and provide support in the form of diagnosis, treatment, and preventive medical, dental, and veterinary care to citizens in remote areas of the U.S. or its territories. The program is designed to enhance the unit's medical readiness, provide unit training opportunities and serve the public in locations where medical care is not otherwise available. The program may not compete with local private medical care that may be available.
- **Air Ambulance Participation.** The Military Assistance to Safety and Traffic Program. (MAST) is a proven example of Army support to civil authorities. This program permits the utilization of Army aviation assets to conduct emergency air evacuation and recovery efforts.
- These projects contribute to the health and welfare of the community, making the Army an integral partner in community progress and development. They can enhance the ability of the local community to support itself and its people, to provide the best possible services to the citizens and to promote a positive, healthy safe environment.
- Community service activities are those which focus on improving the community, its infrastructure and its ability to serve the local population.

7-47. **Social Improvements.** Community service social improvements, which focus on making the social environment as healthy as possible, provide the widest range of support to the population. They encompass many projects including:

7-48. Support to youth programs, such as scouting and programs that provide assistance to special need audiences such as the Special Olympics.

7-49. Examples are:

-
- The Civilian Youth Opportunities Program (Challenge). This is a youth program directed at attaining a high school diploma, providing job training and placement, improving personal and social skills and providing health and hygiene education and physical training. Soldiers work with civilian leaders to provide a comprehensive support package, ranging from choosing appropriate clothing to attending residential training facilities.
 - Youth Physical Fitness Clinic Program. The National Guard encourages fitness and combines academic and athletic achievement by helping schools conduct competitions in selected athletic events. This program also establishes a separate scholar-athlete category for those students with a 3.5 or higher grade point average.

7-50. Involvement in ventures and projects that enhance the educational or cultural climate of the community, such as adult literacy, reading or community theater programs.

7-51. Examples are:

- Civilian Community Corps. This program provides managerial, organizational and technical skills for disadvantaged Americans seeking the skills for success. Through this program, the Army helps participants become productive citizens. In exchange, participants perform a wide range of community service activities that improve the foundation of American society. This program encourages intra-governmental cooperation on the federal level. It also encourages partnerships with industry, education, state, federal and local governments.
- Science and Technology Academies Reinforcing Basic Aviation and Space Exploration Program. (STARBASE) This program is an innovative partnership of professional educators, military personnel and corporate sponsors. It promotes science, mathematics and technology basics for primary through secondary schools. Using National Guard resources to spark student interest, the program develops strong self-esteem, provides excellent role models, promotes positive attitudes and develops goal-setting skills.
- The guiding principle behind community relations efforts is that the installation and the community have a common interest in providing the best possible support for each other. A cooperative relationship exists, because soldiers stationed at the installation receive life support from the community while many of the civilians who make up the community receive life support from the installation. The interdependence of the military installation and the civilian community can involve economics, education, health care, basic services, quality-of life issues and many others.
- The community relations goal of local commanders is to develop an open, mutually satisfactory, cooperative relationship between the installation and the community. These efforts improve the community's perception of the installation and the soldiers, family members and civilians who are part of the installation.
- Participation in community relations activities is an effective method for projecting a positive Army image, making the best use

of assets, providing alternative training opportunities and enhancing the relationship between the Army and the American public. Activities vary widely, ranging from individual soldier involvement to full Army participation. They are characterized by detailed coordination between the military command and community authorities. They fulfill community needs that would not otherwise be met, enhance soldier and unit morale, skills and readiness and improve the mutual support between the military and civilian communities.

Chapter 8

PA Organizations

THE BRIGADE

8-1. The Brigade PAO is the lowest level to which the Army has assigned organic Public Affairs Assets.

8-2. Working as both a special staff officer and as a member of the Brigade's planning team, the BDE PAO acts as the spokesperson for the unit, advisor to the Commander, and provides Public Affairs guidance and planning to commanders at all levels.

8-3. To support and conduct Public Affairs Operations within the Brigade, the BDE PAO has the following functions, organization and equipment:

8-4. Specific functions of the Brigade PAO, as outlined within the core competencies are:

- **Public Affairs Planning**

- Advise the commander and staff on PA implications of plans and actions.
- Write Brigade PA annex and matrices using operational tools, terms, graphics, and concepts
- Execute the plan
- Plan for future operations.
- Command and control attached Public Affairs assets within the brigade AO.
- Tactically communicate with PA units and supported combat units in the Brigade's Battlespace.

- **PA Training**

- Train and supervise stringers to assist their commanders in conducting their internal information programs.
- Train soldiers, family members, DACs and everyone habitually associated with the unit to comfortably and successfully communicate with the media.
- Utilize Train the Trainer.
- Evaluate public affairs training programs of subordinate commands.
- Train subordinate commands to facilitate the media.

- Train leaders and soldiers to protect information products and information systems from compromise and intrusion by practicing security at the source.

- **Media Facilitation**

- Assist media to gain access to units, soldiers and commanders.
- Evaluate subordinate command's media facilitation plan.
- Assist subordinate commanders to coordinate transportation.
- Conduct situation briefs as needed.
- Monitor media operations within the Area of Operations. (Maintain accountability of the media to preclude fratricide. Accomplished through reports from escorts or through electronic tagging and monitoring.)
- Respond to and mediate potential media problems; react quickly to coordinate and facilitate information issues in Brigade's Battlespace.

- **Information Strategies**

- Monitor and analyze the local Military Information Environment.
- Provide public affairs support to the G5 / S5 for the development and implementation of civil affairs programs.
- Support higher echelon Public Affairs requirements for information.
- Gather Open Source Information to help build relevant information.
- Assist Commanders to conduct internal and external information to include Hometown News Release Program.
- Monitor local news media products (Visual, print and audio) and analyze for PA implications.
- Monitor and Analyze the local Military Information Environment.
- Protect digital images, information products and PA and non-PA information systems from compromise and intrusion.

8-5. Organizational Structure:

- Captain , 46A.
- Sergeant, 46Q

8-6. Equipment:

- Computer with compatible software and communications hardware
- Access to the Tactical Internet and tactical battlefield radio communications
- Access to FM, Satellite, and video and cellular communications
- Access to Army Battle Command System, (MCS\P or CSS\CS)

8-7. Transportation:

- HMMWV

8-8. Additional Support Requirements. PAO requires linguistic support from the Civil Affairs soldiers or contract civilians attached to the Brigade.

SAMPLE PA EXECUTION MATRIX BRIGADE PUBLIC AFFAIRS OFFICER

THE DIVISION

8-9. The Division PAO is the next level to which the Army has assigned organic Public Affairs assets. The division is largely self-sustaining and capable of independent operations. The division is a unit of maneuver, organized with varying numbers and types of combat, combat support (CS) and combat service support (CSS) units.

8-10. The division may be armored, mechanized, medium, light infantry, airborne or air assault; each can conduct operations over a wide range of environments.

8-11. Working as both a special staff officer and as a member of the division planning team, the DIV PAO acts as the spokesperson for the

division, advisor to the Commander, and provides Public Affairs guidance and planning.

8-12. To support and conduct Public Affairs Operations within the division, the DIV PAO has the following functions, organization and equipment:

8-13. Functions: Assumption #1: DMAIN is not in country

- Gather, analyze and disseminate open source information, focusing on global media, to increase the situational awareness throughout the command.
- Gather and disseminate multimedia products throughout the command, and to external and home station audiences.
- Conduct Public Affairs research and write the PA Estimate of the situation.
- Write the PA plan for OPORDERS, OPLANS, and TACSOPS.
- Monitor and analyze American and foreign public sentiment of current operations from available media sources for PA implications and advice.
- Monitor and analyze battlespace communications (visual, audio, FM, satellite) for PA implications.
- Monitor news media products (Visual, print and audio) and analyze for PA implications.
- Facilitate Media Operations.
- Subfunctions:
 - Assist media to gain access to units, soldiers and commanders.
 - Coordinate air and ground transportation on a non-interference basis.
 - Conduct daily situation briefs as needed.
 - Respond to media queries.
 - Validate media's credibility, expertise, knowledge, purpose and legitimacy.
 - Train and supervise unit-level PA representatives (Command Information NCOs) to assist their commanders command information programs.
 - Train soldiers, family members, DACs and everyone habitually associated with the unit to comfortably and successfully communicate with the media.
 - Survey soldiers, family members, DACs and other members of the internal audiences to measure effectiveness of the command information program.

8-14. Assumption #2: DMAIN is in country

- Advise the commander and staff on PA implications of plans and actions
- Gather, analyze, and disseminate Open Source Information, focusing on global media to increase the commander's situational awareness.
- Gather and disseminate multimedia products throughout the command, and to external and home station audiences.

-
- Conduct Public Affairs research and write the PA Estimate of the situation.
 - Write the PA plan for OPORDERS, OPLANS and TACSOPS
 - Monitor and analyze American and foreign public sentiment of current operations from available media sources for PA implications and advise
 - Monitor and analyze battlespace communications (visual, audio, FM, satellite) for PA implications
 - Monitor news media products (Visual, print and audio) and analyze for PA implications
 - Coordinate and integrate all information-related functions (PSYOPS, CA, VI, Joint, Combined and Interagency PA) into the PA plan
 - Conduct Information Operations
 - Act as a conduit for CI products from the field, sanctuary and commercial sources for input into the commander's information program. Provide command information to soldiers, family members and Department of the Army Civilians.
 - Facilitate Media Operations
 - Subfunctions:
 - Coordinate air and ground transportation on a non-interference basis
 - Assist filing stories, video and photographs on a non-interference, reimbursable basis
 - Conduct daily situation briefs as needed
 - Respond to media queries
 - Validate media's credibility, expertise, knowledge, purpose and legitimacy
 - Conduct Primary and Secondary accreditation
 - Primary--Full accreditation of non-accredited media
 - Secondary--Process media previously accredited at Corps and higher
 - Survey soldiers, DACs and other members of the internal audiences to measure effectiveness of the command information program

8-15. Organizational Structure:

- At a minimum an embedded PA division section has:
 - Major 46A and two Captains 46A
 - Master Sergeant 46Z
 - Specialist 46Q
 - Specialist, 46R
 - PFC 46Q

8-16. Equipment:

- Computer with compatible software and communications hardware and tactical fax machine.

- Access to the Tactical Internet and tactical battlefield radio communications (SINGARS, MSRT etc.)
- Access to FM, Satellite, video and cellular communications
- Access to Army Battle Command System, (MCS\P)

8-17. Transportation:

- Light Division--HMMWV
- Armor and Mech Division-- HMMWV and Trailer

8-18. TAC 1 AND 2 Missions and Functions

TACTICAL COMMAND POST PA SECTION

8-19. The TAC CP, Public Affairs Section is task-organized based on METT-TC. It is the center of gravity for immediate internal and external communication, resolution of Public Affairs issues and violations of ground rules by media representatives. It acts as a conduit to the Information Operations Cell in the DMAIN adding immediacy to the Open Source Information process.

8-20. Public Affairs personnel deploy with the lead elements during any contingency and remain with the TAC CP to assist the commander, provide internal command information to deployed soldiers and limited external information to home station. They conduct media facilitation to expedite the flow of information to the America public while freeing the commander and his soldiers to conduct their mission.

8-21. The TAC CP, Public Affairs Section maintains connectivity with commanders and global information sources. It contributes to and monitors the common relevant picture, and synchronizes collection and dissemination efforts of soldiers far forward to internal and external audiences.

8-22. Particularly during split-based operations, the PAO task organizes his section to best serve the commander, his soldiers and the American public's need for information.

8-23. Assumption #1: DMAIN is not in country

- Act as the division spokesman.
- Advise the commander and staff on PA implications of plans and actions.
- Execute the plan.
- Assist DMAIN to gather Open Source Information to build the common relevant picture.
- Conduct Information Operations.
- Gather and disseminate multimedia products throughout the command and to external and home station audiences. Act as a conduit for CI products from the field, sanctuary and commercial sources for input into the commander's information program.
- Monitor and analyze battlespace communications (visual, audio, FM and satellite) for PA implications.
- Monitor local news media products (Visual, print and audio) and analyze for PA implications.

-
- Coordinate, integrate, and synchronize all information-related functions (PSYOPS, CA, VI, Joint, Combined, and Interagency PA).
 - Synchronize Public Affairs assets (internal and external) within AO.
 - Facilitate Media Operations:
 - Assist media to gain access to units, soldiers and commanders.
 - Coordinate transportation on a non-interference basis.
 - Assist filing stories, video and photographs on a non-interference, reimbursable basis.
 - Conduct daily situation briefs as needed.
 - Respond to media queries.
 - Monitor media operations within the AO.
 - Respond to and mediate potential media problems; react quickly to coordinate and facilitate information issues throughout the AO.
 - Validate media's credibility, expertise, knowledge, purpose and legitimacy.
 - Provide seamless connectivity for media accountability throughout the AO.
 - Conduct Primary and Secondary accreditation.
 - Primary--Full accreditation of non-accredited media.
 - Secondary--Process media previously accredited at Corps and higher.

8-24. Assumption #2: DMAIN is in country

- Act as the division spokesman.
- Advise the commander and staff on PA implications of plans and actions.
- Execute the plan.
- Assist DMAIN to gather Open Source Information to build the common relevant picture.
- Monitor battlespace communications (visual, audio, FM and satellite) for PA implications.
- Facilitate Media Operations:
 - Assist media to gain access to units, soldiers and commanders.
 - Conduct daily situation briefs as needed.
 - Monitor media operations within the AO.
 - Respond to and mediate potential media problems; react quickly to coordinate and facilitate information issues throughout the AO.
 - Provide seamless connectivity for media accountability throughout the AO.
 - Conduct Secondary accreditation.
 - Secondary--Process media previously accredited at Corps and higher.

8-25. The division public affairs section provides public affairs support to the division commander and to divisional units deployed in support of combined or joint operations. The division PAO has operational and tactical control over all PA TOE organizations assigned or attached to the division and coordinates closely with embedded PA sections within brigades or divisions to carry out PA operations.

8-26. The division PA staff, when deployed, is augmented by one PAD and one MPAD per three combat brigades. The division public affairs section, if augmented only by a Public Affairs Detachment, operates the division media operations center.

8-27. Traditionally, divisions have operated as part of a corps. In corps operations, divisions normally comprise 9 to 12 maneuver battalions, organic artillery battalions and supporting CS and CSS units. Divisions perform a wide range of tactical missions and for limited periods are self-sustaining. Corps augment divisions as the mission requires.

Chapter 9

Information Operations

INTEGRATING PUBLIC AFFAIRS

9-1. Information Operations involve a variety of disciplines and activities that range from electronic warfare and physical destruction through cyberwar and information campaigns. Public affairs is a related activity of IO, and contributes to overall operational success, both real and perceived.

9-2. Successful integrated IO requires coordination of themes, messages and activities in order to leverage the massing of information effects. When synchronized with other military operations, IO is a combat multiplier.

9-3. Information campaign objectives cannot be neatly divided by discipline, such as PA, CA and PSYOP. The responsible organization cannot be easily determined solely by looking at the medium, the message or the audience. For example, information about weapons turn-in policy and collection sites may be disseminated through a variety of means. This could include direct contact by Civil Affairs personnel with local populations and their leaders; PSYOP print and broadcast products; news releases, press conferences and other media facilitation coordinated by PA.

9-4. In accordance with joint doctrine (Joint Pub 3-61, Doctrine for Public Affairs in Joint Operations), public affairs are an operational function designed to contribute to the overall success of joint operations. For Public Affairs, the audience may be internal or external, but the objective is constant: Soldiers, participants and the public must understand objectives, motives and the nature, scope and duration of friendly actions. The relevant audiences important to the commander are not limited to soldiers and the American public, but are also international as well as local to the operation.

9-5. Synchronized information operations contribute to military campaigns in a variety of ways. These contributions may:

- Gain or sustain support for the U.S. or coalition position
- Reduce the need for combat forces
- Influence events with non-lethal means
- Counter propaganda and disinformation
- Discourage adversary offensive operations
- Deter hostile actions

- Undermine illegitimate regimes
- Support the maintenance of coalitions

9-6. Information Operations during peacekeeping operations:

- Promote peaceful cooperation
- Lower friendly force requirements
- Counter propaganda and disinformation
- Reduce friction leading to hostilities
- Gain and maintain the initiative
- Shape opponent plans and operations

9-7. These goals may not be achieved solely by tactical level information operations, but rather, may be theater and national-level issues that are reinforced by tactical-level message dissemination. This requires horizontal and vertical integration of themes and messages to achieve a massing of information effects.

IO STAFF ORGANIZATION

9-8. Composition of the Information Operations battle staff/coordination council or other such element is flexible and tailored to the operation and desires of the commander. (See figure 9-1). Notional IO staff structures are included in FM 3-13 (100-6), Information Operations.

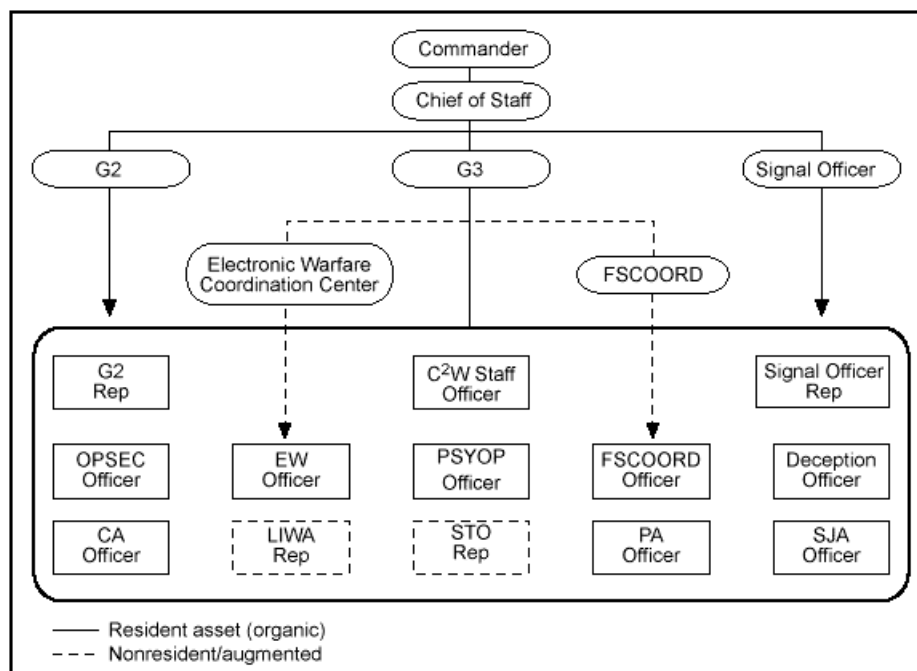

Fig 9-1 Notional IO Battlestaff

9-9. The IO cell is often headed by the G-3 or his designated representative, and includes representatives of a variety of organizations. The staff may include, but not necessarily be limited to the G2, G3, G5, G6, PAO, PMO, JAG, PSYOP, Electronic Warfare Officer, Political Advisor, Joint Military Commission representative, Fire Support Coordinator and Targeting Board representative.

9-10. The successful accomplishment of a specific mission may require the close coordination and synchronization of the range of information activities as well as maneuver elements. While the IO cell is lead by the G3 or his designate, IO coordination is the responsibility of the Land Information Warfare Activity field support team. While providing a public affairs representative to the IO Cell, PAOs must maintain a clear and direct link with the commander.

LIWA

9-11. The Land Information Warfare Activity, an INSCOM element, provides commanders with field support teams (FST) that serve as IO advisors in addition to effecting the synchronization and coordination of the range of activities that support IO. LIWA field support teams do not serve as functional area specialists, but rather, coordinate the activities of those elements. For example, the LIWA FST members may be from the military intelligence and PSYOP branches, but do not serve as the commander's intelligence analyst or PSYOP planner, or for that matter, Public Affairs advisor. They do, however, coordinate the actions and products of these and other activities in support of the IO plan.

PA SUPPORT TO INFORMATION OPERATIONS

9-12. PA participation in IO involves no completely new tasks but does require a broadened scope of operations. PA support to IO requires analysis of the Global Information Environment (GIE) and the operational environment, as well as synchronization of efforts with other organizations and agencies to ensure themes and messages are consistent and deconflicted.

9-13. PA in IO requires PA staffs to be fundamentally proactive rather than reactive. Often, actions may be taken and products developed to assist command achievement of a desired end state. This is more than merely reacting to events with a press release or conference

9-14. PA actions and events that support IO include print and electronic products, news releases, press conferences and media facilitation. PA advises the commander on how the operation is being perceived and portrayed and also provides guidance to unit commanders and soldiers. This includes regular talking points and themes for commanders and preparing soldiers to interact with the press. It's a means of emphasizing selected issues and positions--speaking with one voice.

PA ESTIMATE AND IO PLANNING

9-15. The starting point for PA contributions to Information Operations is the Public Affairs Estimate. (See Appendix C). The PA estimate consolidates information on the audiences, media presence, public opinion, personnel available and PA guidance.

9-16. This is not a static document created at the beginning of an operation, but must be continually updated to reflect changes in the operational situation and environment. Issues to consider include:

9-17. **Audience analysis.** Who are the audiences, both internal and external? What are their information needs? How do they get their information: television, radio, newspapers or word of mouth? Is the media

state-run or independent? Does the audience population have telephones, cell phones, fax machines or Internet connections? These devices are frequently found even in developing countries and must be considered during the analysis of information channels.

9-18. **Media presence.** What media representatives and organizations are in the area of operation? Are they radio, television or print? Are they state-run or independent? What is their political slant? Are they pro- or anti-coalition? Are they receptive to coalition information products such as news releases or other print or electronic products? Is the local media interested in live interviews with U.S. commanders and soldiers?

9-19. **Public Opinion.** What are the opinions/beliefs of the local populations; of the international community; of the U.S. national population?

9-20. **Personnel available.** What is the available Public Affairs force structure (PADs, MPADs, BODs, CPIC/JIB staff, unit organic PA staff and individual additions), translators, Combat Camera and administrative staff.

9-21. **PA guidance.** What guidance has been received from higher levels? Official positions on theater issues are naturally not developed at the tactical level. What is the theater strategic/national command authority position? This is often coordinated and deconflicted at all levels via conference calls and other communication means.

IO CAMPAIGN CYCLE

9-22. There are four stages to an IO campaign cycle: capability development, assessment, planning and execution. The execution stage is accompanied by evaluation-- during and after the mission -- in order to adjust operations as needed and after the operation to gather lessons learned.

9-23. Capability development:

- Identify local resources and available external support. Theme and message delivery can take many forms, including radio/television, handbills, leaflets, loudspeakers, soldiers, displays, the Internet, internal information products, USIA, Voice of America, print and electronic news releases, press conferences, direct contact with parties, leaders, officials and citizens. Direct contact may include military liaisons, Civil Affairs personnel, diplomatic contact, or any form of personal interaction.
- Establish processes and procedures
- Collect, organize and store relevant information

9-24. Assessment

- Perform mission analysis
- Obtain commander's guidance
- Define IO goals and objectives
- Conduct risk assessment
- The assessment phase includes a mission analysis, clarification of the commander's guidance, initial identification of IO goals and objectives and a risk assessment. Goals and objectives include a

determination of the desired end state and what must be done to achieve it. This may mean inducing others to take or not take certain actions, or have the information to make certain decisions that will support the goals of the operation. Public Affairs is not in the business of shaping beliefs and attitudes of populations, but can provide factual information that enables people to make informed decisions.

- Risk Assessment
 - Consequences for command if information operation fails?
 - Potential unintended effects?
 - Operational success too reliant on IO?
 - Can IO campaign be used against U.S. or coalition?
 - Force protection issues?
 - Compromise or loss of impartiality?

9-25. Planning

- Develop and coordinate themes
- Determine the best implementation means
- Delineate tasks and responsibilities
- Identify feedback and measures of effectiveness channels
- Prepare implementation order
- During the planning phase, specific themes are developed and coordinated with all members of the IO cell. Message/theme delivery methods are determined and specific tasks and responsibilities are assigned. The IO cell may use a synchronization matrix to effectively manage IO events. For example, this matrix will indicate specific actions, events or products each member organization of the IO cell will execute or produce to support the plan. For example, a specific event may require PSYOP leaflets and broadcasts, PA press releases, news conferences and interviews with soldiers and Civil Affairs meetings with local officials and community leaders. These activities are coordinated on the matrix, ensuring deconfliction of resources, messages and products.
- Measures of effectiveness and feedback indicators vary widely and should be identified in the planning process. They may include questions raised by the media, editorials and commentaries, statements by public officials, postings to internet newsgroups and forums, demonstrations and protests, statements during meetings, responses given to public opinion surveys, behaviors during specific events, as well as other SIGINT and HUMINT collection and analysis.
- The product of the planning phase is a synchronization matrix and execution schedule. The matrix is then coordinated with the overall synchronization matrix, ensuring that IO is coordinated across the BOSSs.

9-26. Execution

- Conduct the mission.

- IO monitoring must be conducted throughout the execution of the event and during follow-up review, feedback and evaluation.
- If necessary or possible, alter mission if evaluation determines it is not successful or unexpected responses occur.

9-27. **Evaluate**

- Assess the effectiveness of the operation
- Determine preventive methods, document lessons learned and apply to next operation

Appendix A

DoD PRINCIPLES OF INFORMATION

The DoD Principles of Information are contained in DoD Directive 5122.5, Change 1. They chart the course for all DoD Public Affairs activities, and apply to the full continuum of day-to-day activities and operations. It is the commander's responsibility to ensure that all planning for military activities and operations efficiently and effectively achieve the goals set by these principles.

DOD PRINCIPLES OF INFORMATION

- A. Timely and accurate information will be made available so that the public, Congress, and the news media may assess and understand the facts about national security, defense strategy, and on-going joint and unilateral operations.
- B. Requests for information from organizations and private citizens will be answered in a timely manner. In carrying out this policy, the following principles of information apply:
 - (1) Information will be made fully available, consistent with statutory requirements, unless its release is precluded by current and valid security classification. The provisions of the Freedom of Information Act and the Privacy Act will be complied with in both letter and spirit.
 - (2) A free flow of general and military information will be made available, without censorship or propaganda, to the men and women of the Armed Forces and their family members.
 - (3) Information will not be classified or otherwise withheld to protect the government from criticism or embarrassment.
 - (4) Information will be withheld only when disclosure would adversely affect national and operations security or threaten the safety or privacy of the men and women of the Armed Forces.
 - (5) The Department's obligation to provide the public with information on its major programs and operations may require detailed public affairs planning and coordination within the Department and with other government agencies. The sole purpose of such activity is to expedite the flow of information to the public; propaganda or publicity designed to sway or direct public opinion will not be included in Department of Defense public affairs programs.

Appendix B

THE GUIDELINES FOR COVERAGE OF DOD COMBAT OPERATIONS

DOD MEDIA GUIDELINES

The DoD Media Guidelines, issued as Change 3 to DoD Directive 5122.5, provide the following guidelines for coverage of DoD combat operations:

- A. Open and independent reporting will be the principal means of coverage of U.S. military operations.
- B. Pools are not to serve as the standard means of covering U.S. military operations. But pools may sometimes provide the only feasible means of early access to a military operation. Pools should be as large as possible and disbanded at the earliest opportunity--within 24 to 36 hours when possible. The arrival of early access pools will not cancel the principle of independent coverage for journalists already in the area.
- C. Even under conditions of open coverage, pools may be appropriate for specific events, such as those at extremely remote locations or where space is limited.
- D. Journalists in a combat zone will be credentialed by the U.S. military and will be required to abide by a clear set of military security ground rules that protect U.S. forces and their operations. Violation of the ground rules can result in suspension of credentials and expulsion from the combat zone of the journalists involved. News organizations will make their best efforts to assign experienced journalists to combat operations and then make them familiar with U.S. military operations.
- E. Journalists will be provided access to all major military units. Special operations restriction may limit access in some cases.
- F. Military public affairs officers should act as liaisons but should not interfere with the reporting process.
- G. Under conditions of open coverage, field commanders will permit journalists to ride on military vehicles and aircraft whenever feasible. The military will be responsible for the transportation of pools.
- H. Consistent with its capabilities, the military will supply PAOs with facilities to enable timely, secure compatible transmission of pool material and will make these facilities available whenever possible for filing independent coverage. In cases when government facilities are unavailable, journalists will, as always, file by any other means available. The military will not ban communications systems operated by news media organizations, but electromagnetic operational security in battlefield situations may require limited restrictions on the use of such systems.
- I. These principles will apply as well to the operations of the standing DoD National Media Pool system.

Appendix C

PUBLIC AFFAIRS ESTIMATE

SAMPLE PA ESTIMATE

FM 6-99 (101-5)

Classification

Headquarters

Place of issue

Date, time, and time zone

Message Ref. no.

PUBLIC AFFAIRS OPERATIONS ESTIMATE NO. _____

References: Maps, charts, or other documents.

Time zone used throughout the estimate:

1. MISSION

This paragraph lists the command's restated mission from a public affairs perspective.

2. THE SITUATION AND CONSIDERATIONS

The paragraph describes the strategic and operational media environment in which the operation is being conducted and identifies the critical factors that might impact on the command's mission -- the "action and reaction" within global media channels. It identifies the media environment across the operational continuum, describing it from "austere" for low media interest and capability in a limited AOR communication infrastructure to "dynamic" for high media interest and capability in a high-tech AOR infrastructure. At a minimum, this paragraph must include:

- a. Information environment. This paragraph describes the characteristics of the operation and the information environment in the area of operations. It identifies any activities or issues affecting the over-all mission and the command's public affairs objectives.
- b. Media presence. An assessment of the news media presence in the theater of operations prior to deployment and the likely presence of additional news media during the conduct of operations. This assessment

- should address the authority under which media representatives are operating and the degree of control that can be imposed on their efforts.
- c. Media capabilities. An assessment of the media's information collection and communication technology, specifically identifying their level of visual information acquisition and satellite communication capabilities. It includes an analysis of the logistics support, transportation assets, and host-nation communications infrastructure available to them.
 - d. Media content. An assessment of the global media's presentation of information and their agendas, and an analysis and prioritization of the potential strategic and operational issues confronting the command in the news media. This media content analysis will provide an evaluation of the quantity of coverage and the nature of that coverage.
 - e. Public opinion. Assessment of national and international attitude about the operation and command, leaders, and soldiers conducting it. This paragraph should include both the perceptions held by major audience groups and the relative solidity or strength of those attitudes. A public opinion analysis should include as a minimum an analysis of the following groups:
 - American public
 - Civilian political leaders
 - Coalition and allied forces and their publics
 - International audience
 - Internal command audience
 - Home station public
 - f. Information channel availability. An assessment of the information channels available for the communication of information in and out of the AOR. It identifies the means available to the commander for receipt, transmission, and dissemination of voice, data, text, graphics, and digital visual imaging. It describes command, coalition, and local national facilities and equipment available, to include an analysis of available telephone lines for voice and data transmission, the accessibility of audio and video channels, the prevalence of private communications devices such as soldier-owned cellular telephones, facsimile machines, computers, portable radios and televisions, still and video cameras, and the nature and flow of the information possible through these channels.
 - g. Information needs. This is an assessment of the information needs of the previously identified key publics. It analyzes key internal and external audiences and assesses their news and information expectations. It identifies the types of information made available to these key audiences.
 - h. Personnel situation. Describes the present dispositions of public affairs personnel and units that affect the PA mission, and the assets needed and available. State known personnel problems, if any, that may affect the PA situation. Consult the personnel estimate for details. (Examples of personnel include shortages of PA NCOs and skilled operators for equipment.)
 - i. Public Affairs situation. This summarizes current PA objectives and identifies specific courses of action for each objective. At high levels of command, detail information in a summary with a reference to an annex to the estimate. Subparagraphs will include all current (PAG) from OSD (PA).
 - j. Logistical situation. State known logistic problems, if any that may affect the PA situation. See logistic estimate for details. (Examples of

logistic problems include the lack of transportation and adequate facilities.)

- k. Assumptions. Until specific planning guidance from the commander becomes available, you may need assumptions for initiating planning or preparing the estimate. Modify these assumptions as factual data or planning guidance becomes available.

3. ANALYSIS OF COURSES OF ACTION

Analyze each course of action based on the public affairs objectives in paragraph 2i. Indicate problems and deficiencies. At a minimum, subparagraphs should include media facilitation and support, news and information provision, and force training and support.

Analyze each COA from a PA point of view to determine its advantages and disadvantages for conducting PA. The detail in which the analysis is made is determined by the level of command, scope of operations, and of urgency of need.

4. COMPARISON OF COURSES OF ACTION

Compare each course of action. List advantages and disadvantages of each course of action under consideration. Include methods of overcoming deficiencies or modification required for each course of action.

5. CONCLUSIONS

- a. Indicate whether you can support the command mission (restated in paragraph from the public affairs viewpoint).
- b. Indicate which COAs you can best support.
- c. List major public affairs deficiencies, which commander must consider. Include specific recommendations about methods of eliminating or reducing their effects.

ANNEX__ (PUBLIC AFFAIRS) TO OPERATIONAL ORDER _____

References: Maps, charts, and other relevant documents

Time zone used throughout order:

1. SITUATION

A brief general description of the situation, information affecting public affairs support, which paragraph 1 of the OPOD does not cover, and intended purpose of this annex.

- a. Friendly forces. Outline the higher headquarters' plan (and PA annex) and adjacent unit PA plans. Provide information on friendly coalition forces, which may impact the PA mission. Note PA resources supporting the unit. (Who, where, when), (higher, allied and adjacent headquarters).
- b. Attachments and detachments. Identify all augmenting PA units supporting this command and all attached/assigned subordinate units. Include effective dates, if applicable.
- c. Enemy forces. List information not included in the OPLAN/OPORD, which may impact the PA mission. (Who, where, when, disinformation, rumors, propaganda and OPSEC).
- d. Media. Identify media in the area. (who, where, pools, US. international, local-host country).
- e. Assumptions. List any additional assumptions or information not included in the general situation, which will impact the PA mission.

2. MISSION

Clearly, concisely state the public affairs mission. (Internal information for deployed and non-deployed forces, media facilitation and staff operations).

3. EXECUTION

- a. Concept of operation. Briefly summarize the public affairs operation plan. Include PA priorities. (Intent --access, information, welfare, morale, will to win) (Concept--who, where, what, why, when) (Specifics--task to a

subordinate; who is to do what, where, when, covers non-PAs too, actions with media: credential, train, transport)

- b. Outline of PA tasks. Identify and assign supporting PA tasks to each element of subordinate and supporting units. Assign specific tasks to elements of the command charged with public affairs tasks, such as requirements for PA augmentation.
- c. Coordinating instructions. Give details on coordination, task organization and groupings. List instructions, which apply to two or more subordinate elements or units. Refer to supporting appendixes (PA assessment) not referenced elsewhere. (Public Affairs Guidance, media in country, media enroute with US forces, media contact report, handover checklist, and task organization).

4. SERVICE SUPPORT

- a. A statement of the administrative arrangements applicable to this operation. If they are lengthy or are not ready for inclusion in the OPORD, these arrangements may be issued separately and referenced here.
- b. A statement of the logistical arrangements applicable to this operation. Specific coordination should be included if possible, but arrangements may be issued separately and referenced here, if they are too lengthy. (Class I-IX and water), (Services: billets, medical, laundry and mortuary), (Transport: ground, air, TOE, tasked rented/leased, contracted).

5. COMMAND AND SIGNAL

List signal, visual imaging and satellite communications policies, headquarters and media center locations or movements, code words, code names, and liaison elements. (PAO location, media center, JIBs, sub-JIBs, phones, faxes, e-mail and web page).

Appendix E

PUBLIC AFFAIRS GUIDANCE

SAMPLE PA GUIDANCE

Public Affairs Guidance (PAG) is the operational tool that guides commanders and their public affairs officers in the application of doctrine and policy during major military operations, exercises, and contingencies. The information below is tended to assist local commanders in preparing and obtaining approved guidance.

DoD policy requires that PPAG be provided to the Assistant Secretary of Defense-Public Affairs (ASD-PA) by the Unified and Specified commands and others, as required for all major operations.

This requirement includes major training exercises that could attract national and/or international attention. PPAG may not be used without ASD-PA approval.

Upon receipt of the warning order, the commander, through his PAO, should request PAG from high headquarters. PAG may be included in alert notification or operational orders (see Part Three: Operational Planning). Commanders of major units/commands will direct their PAOs to prepare PPAG to forward the proposal through MACOM and Unified/Specified command PA channels to ASD-PA.

Commanders of Unified/Specified commands should ensure that the PPAG has been coordinated with appropriate organizations within the theater of operations whenever possible (e.g., embassies, country teams, host governments, subordinate commands).

Upon receipt of the PPAG, the ASD-PA coordinates and staffs the PPAG within the DoD and Department of State.

The ASD-PA then issues a message either approving, modifying, or disapproving the PPAG. PPAG is broken down into subject, references and then eight paragraphs (Information/explanation, Purpose and coordination for PPAG, PA Approach, Public Statement, Q&As, Contingency Statement, Miscellaneous Information, Point of Contact).

The format for PPAG follows:

SUBJECT

The subject line of the PPAG should state "PROPOSED PUBLIC AFFAIRS GUIDANCE - followed by the exercise and/or event name (U)." For coordination, it is best if the subject is unclassified.

If an exercise or event is so sensitive that the actual name cannot be used, an unclassified short title should be used; e.g., "PROPOSED PUBLIC AFFAIRS GUIDANCE - CC-(U)."

REFERENCES

Pertinent messages or other documents shall be cited in the reference section. If the PPAG is based on PA policy in the Significant Military

Exercise Brief, then the SMEB message Date-Time-Group (DTG) shall be listed.

EXERCISE INFORMATION

The **first paragraph** of the PPAG shall explain the references, the exercise, and any significant existing or anticipated problems associated with the exercise. The information in this paragraph is not for release so may remain classified after the PAG is approved for release. This paragraph may restate some PA information from the SMEB.

COORDINATION INFORMATION

The **second paragraph** shall explain the purpose of the message; identify it as being fully coordinated and theater-approved; request ASD-PA approval and specify the date it is required for use. If the PAG is transmitted to the ASD-PA before it is fully coordinated, it is the responsibility of the submitting command to ensure that the ASD-PA is promptly informed of the results of the remaining coordination. The submitting command should always follow-up a PPAG message with a phone call to ensure that the primary addressee(s) is aware that the message is en route. When the submitting command is a supporting CINC from outside the supported CINC's AOR, the supported CINC is responsible for theater coordination.

PA APPROACH

The **third paragraph** shall discuss the public affairs approach for the exercise; i.e., active or passive. This may be a restatement of the PA policy indicated in the SMEB.

- Active Approach
 - For this discussion, an "active approach" involves efforts made to stimulate public or press interest such as distributing press releases and inviting the press to observe the exercise. If an exercise or event is to be publicly announced, this paragraph shall state who will make the announcement, the method of announcement, and preferred time, and date for the announcement. If unusual circumstances prevail, the rationale for the recommendation should also be included. Part I and II exercises shall normally be announced by the ASD(PA) by issuing a news release (blue top). Other lesser exercises or training deployments, if announced by the ASD(PA), normally shall be made by release of a memorandum for correspondents (MFC). The preferred release time and/or date of exercise announcements is 1200 Eastern Standard Time (E.S.T.) on either Tuesdays or Thursdays in conjunction with the normally scheduled DoD press briefing. If a combined announcement is desired with a host country, complete details of the methods, time, and procedure shall be included in this paragraph. The active approach is recommended whenever possible to ensure appropriate media coverage of specific commands and/or units.
- Passive Approach
 - A "passive approach" is where no action is taken to generate media and/or public interest in an issue or activity beyond answering specific inquiries. If a passive approach is desired,

the PPAG shall so indicate and specify that the PAG is for response to query (RTQ) only. It shall also specify who is authorized to respond; e.g., "Only OASD(PA) may RTQ," or "All of the following addressees may use this PAG for RTQ only." To de-emphasize an event, it is best to authorize release or RTQ at the lowest possible level.

PUBLIC STATEMENT

The **fourth paragraph** shall contain a statement that explains the exercise and/or event. The statement shall be for public release in an active PA approach or for RTQ in a passive PA approach. For ease of coordination, each paragraph of the statement shall be identified as a sub-paragraph of the message; for example: The following statement is for initial public release: (TEXT FOLLOWS): QUOTE.

EXERCISE (NAME).....

THE EXERCISE WILL.....

PREVIOUS MILITARY.....

FOR ADDITIONAL INFORMATION,

CONTACT.....(UNQUOTE).

As indicated above, the last paragraph of the statement shall identify points of contact where additional information may be obtained.

QUESTIONS AND ANSWERS (Q&AS)

The **fifth paragraph** shall contain a list of proposed Q&As to enable the user to respond to the majority of anticipated questions. They should all be contained in one paragraph and should be numbered sequentially; e.g., Q1, A1; Q2, A2; Q3, A3, etc. Q&As are for use in both active and passive PA approaches, but are strictly for RTQ only and shall not be given to media as handouts.

CONTINGENCY STATEMENT

The **sixth paragraph** of the PPAG shall contain a contingency statement to be used before release of the final PAG. Usually, the contingency statement should be that we don't discuss exercises before they have been formally announced. However, this approach can be modified, as appropriate, depending on the circumstances of the exercise. If a contingency statement is not required, so state in Paragraph 6 of the PAG.

MISCELLANEOUS INFORMATION

The **seventh paragraph** shall contain other pertinent information to include the following items (when a certain sub-paragraph is not applicable, so state): Media Information Centers (e.g., Joint Information Bureaus (JIBs), Press Information Centers (PICs), exercise PA elements, etc.) Discuss whether centers are joint or combined; delineate who is responsible for the establishment; give generic description of its

composition (e.g., U.S. Army desk (O-4 and E-6/E-7), U.S. Navy/Marine desk (USN O-4/O-5, and USMC E-5/ E-6), etc.); establish the center's functions (coordination of all exercise media and/or PA activities, clearance of U.S. military-generated news material before release, production of news material for release, escort of accredited news media representatives); etc.

- Command Relationships
 - Designation of sole approving authority for all exercise-related news materials; procedures for the release and/or clearance of information (to include list of addressees for notification in case of accident and/or incident); request for participating commands and/or units to ensure that the media center is action and/or information addressee on all messages with potential PA impact (to include incident and/or accident reports); hometown news release requirements and/or instructions (passive PA approach may make hometown releases inappropriate); etc.
- Media Coverage
 - State whether media coverage is encouraged or solicited, giving rationale; news media transportation instructions; point of contact (POC) and procedures for handling such requests; requirements for news media representatives (valid passport, working media visa, local accreditation requirements, funds for food, lodging, return travel (if military air is not available), etc.); instructions regarding assistance to continental United States (CONUS)-based units for handling request from news media for accompanying travel before and following public announcement of the exercise; etc.
- DoD National Media Pool
 - Each exercise is a potential opportunity for activation and deployment of the DoD National Media Pool to cover exercise activities. As a minimum, planning should include arrangements for local ground and/or air transportation, special clothing or equipment to be provided, messing, billeting, protection of media equipment and gear, local escort requirements, and communications support for filing of pool products. Sponsoring commands shall indicate whether the exercise should be considered for a pool deployment. Identify the primary POC should the pool be activated.
- Internal Media and Audiovisual Coverage
 - Provide instructions on assistance that will be provided to this effort; degree of freedom of movement (to include whether escorts are necessary); screening of visual information (VI) materials upon completion of exercise; sponsoring command POC for handling internal information matters; etc. Also include guidelines for Armed Forces audiovisual teams documenting the exercise.
- Media Opportunities
 - If known well enough in advance, provide chronology of potential exercise events that would be of interest to media.
- Miscellaneous PA Considerations

- Indicate any other proposed PA activities or considerations; if there are none, then so state.

POINTS OF CONTACT

The **eighth paragraph** shall state the originating POC's name and phone number.

DECLASSIFICATION INSTRUCTIONS

Declassification instructions shall be the last part of the message and in accordance with subsection 4-207 of DoD 5200.1-R (reference (d)).

PUBLIC AFFAIRS OPERATIONS BRIEFINGS

BRIEFINGS

The purpose of a briefing and the desired response or result determines the briefing technique. Basically, there are four briefing types: the information briefing, the decision briefing, the mission briefing, and the staff briefing.

The Information Briefing. The information briefing informs the listener and deals primarily with facts and background information. The Information Briefing contains an introduction to the subject and the scope of the subject area. It then presents the high-priority information requiring immediate attention and complex information involving complicated plans, systems, statistics, or charts. It may also explain controversial situations or information, which require elaboration.

The Decision Briefing. The Decision Briefing includes many of the elements of the information, but goes further by seeking a decision from the decision-maker. At the beginning, the briefer clearly states that he is seeking a decision; at the end, he requests the decision.

The Mission Briefing. The Mission Briefing gives special instructions, amplifies the mission, elaborates on new orders, or assigns taskings to subordinate elements. This briefing usually follows the five-paragraph operations order format. But the briefer may also choose the information briefing format.

The Staff Briefing. The Staff Briefing informs the commander and staff of the current operational situation. Its purpose is to generate a coordinated or unified effort and in a tactical environment. It serves to keep the entire staff aware of each section's activities, thus aiding coordinated action. While there is no specific briefing format, commanders usually tailor this type of briefing to fit their information needs. PAOs address the major PA activities and the PA implications of the operational situation and other staff sections activities.

In a commander's staff briefing, the PAO is responsible for providing a summary of the "global information environment (GIE)." The PAO should present this information at the beginning of the briefing, following the intelligence summary. The PAO's GIE summary, combined with the G2/S2's intelligence preparation of the battlefield (IPB) briefing, helps to complete the picture of the operational situation, which the other elements of the command must react.

Preparation. After conducting the initial analysis of the situation, the briefer gathers and organizes information, prepares visual aids, and then rehearses, briefing only what is essential. Before developing the briefing, the briefing officer or NCO must know and understand:

- the higher headquarters mission
- the higher commander's intent
- the commander's personal guidance and intent
- all aspects of the PA estimate of the situation
- the command's objectives

While much of the information required for a GIE presentation can be found in previously published PA Area Studies, a significant amount of situational information should be pulled directly from the PA Estimate of the Situation and updated to present the latest information available.

BRIEFING FORMAT

The PA briefing format should follow an outline similar to the PA Estimate of the Situation:

- Mission - Command mission including PA objectives
- Situation and Conditions
- Information environment
- PA situation
- Media presence
- Media capabilities
- Media content
- Public opinion
- Information channel availability
- Information needs
- Current Operations/Actions
- Future Operations/Actions

Appendix G

PUBLIC AFFAIRS AREA STUDIES

FORMAT FOR PA AREA STUDIES

Public Affairs area studies provide the PA specialist and the PA planner a starting point to begin their campaign planning process. These studies are produced either to address long-term general background information or to address immediate short-term needs.

BASIC STUDY

A PA study is a document that succinctly describes the most PA-pertinent characteristics of a country, geographical area, or region. It serves as an immediate reference for the planning and conduct of PA operations.

TITLE PAGE

The title page of a Media Environment Study (MES) must show the country, area, group, or other subject of the study. It should also show the classification, the copy number, the date-time group, and command post location. (The originating unit should keep a record of the names, grades, and duty assignments of the authors.)

EXECUTIVE SUMMARY

The executive summary should address the strategic significance of the area under study. (The authors should write the executive summary last, in a clear, brief, accurate, and coherent form.)

NOTE: The commander reading the summary should use its information to decide how to employ Public Affairs in that area.

TABLE OF CONTENTS

Bibliography

Distribution

INTRODUCTION

The introduction outlines the study's intent, cites the directive requiring the study, and explains the study's format.

The study's intent is to provide a summary of aspects of subject country significant to GIE. The study should identify psychological vulnerabilities, characteristics, insights, and opportunities that exist in subject country.

It is prepared as a basic source document for further development of estimates, plans, and annexes.

Although this study can help develop contingency plans, it is not tailored to any particular plan. Rather, its neutral data and insights can be used to analyze possible political and military developments in the region.

Insert here a paragraph referencing the authority directing the study and stating the research cutoff date and provisions for updating the study.

Focus the PA study on the GIE aspects of the many topics addressed. Do not view this document as a comprehensive and self-contained area study.

Instead, use it as a complement to such other standard references as the Department of the Army Area Handbook Series. In addition, the PA study should include:

Results from standard open source products.

Tries to be more analytical than descriptive in nature, making it subject to varying individual perspectives.

Works well when PA specialists compare it with studies on other countries in the region or area.

Is not a U.S. foreign policy statement or comprehensive analysis of subject country, except in areas with direct GIE relevance.

Insert here a statement of U.S. policy goals toward the country in question. This information comes from the proper USA Country Plan, Department of State Policy Memorandum, or similar document, in the priority order.

Because certain gaps exist in getting PA study material (classification level, availability of complete and timely information, or time limits on research), listing these gaps here to aid future research and guide PA study users to further inquiries.

Insert here issues or GIE-relevant material (such as an area map) not included, addressed, or completely answered elsewhere.

CHAPTER 1

HISTORY AND IDEOLOGY

In this chapter, review the evolution of the state and its people, focusing on aspects having GIE and Public Affairs significance. Do not detail chronology of the country's development. Keep in mind, however, the country's history has an important relationship to the country's historical perspective, attitudes, and current world position.

Because of its special importance to PA, in this chapter, cover historical issues thoroughly. An historical analysis of current political, economic, and military policies gives PA personnel a solid base for the study.

CHAPTER 2

GOVERNMENT AND POLITICS

In this chapter, summarize the country's political system. Give a description of its political power sources, policy making process, and the political complexities of the government.

When discussing the political system, pay close attention to the role of individuals, special interest groups, and political parties. Include the population's political attitudes, values, and view of the political system. Also discuss the government's function in society.

CHAPTER 3

FOREIGN RELATIONS AND POLICY

In this chapter, summarize the country's foreign relations. Describe its political alignment in world affairs and its relationship with the United States. Describe the foreign policy of the country. Also analyze and interpret why the country acts as it does in international affairs.

CHAPTER 4

SOCIETY AND CULTURE

In this chapter, analyze the subject country's social setting. Provide the PA personnel with the knowledge needed to understand potential audiences.

Cover the country's social organization and cultural and behavioral patterns and characteristics. Place special emphasis on the society's social values and the role of the family.

Address culture, social organization, education, customs, ethnic composition, and the interrelated effects of religion, language, and history.

CHAPTER 5

ECONOMY

In this chapter, present a brief description of the characteristics, structure, and dynamics of the national economy. Cover the subject country's economic strengths and weaknesses, current economic and labor problems, and economic potential

Describe the country's economic base and the importance of agriculture, industry, and trade. This information helps determine if the present economic structure meets the people's needs.

These economic considerations explain many of the sociological conditions that impact public opinion. Address society's perceptions of the wisdom of government economic policies.

Also describe individual or group perceptions of how members of society stand to gain or lose from those policies.

CHAPTER 6

MILITARY ESTABLISHMENT

In most countries, the military establishment involves itself in internal politics as well as external defense. Even when the military establishment does not directly compete for political power, its actions influence social and political development. Analyze the following topic areas:

- Emergency of the modern military establishment.
- Military roles in the political, economic, and social spheres, and the effects of those roles.
- Issues creating cohesion or conflict within the armed forces.

Leadership.

Conflicts within the military establishment.

Extent, quality, and influence of foreign military aid.

CHAPTER 7

COMMUNICATION PROCESS AND EFFECTS

List essential information about communication patterns for the implementation of a PA program. Include the following information:

Manner and social means of communication (not technical data on communications facilities).

Languages and language groups, nonverbal communication, and nonverbal symbols specific to the country's culture or cultures.

Distinctive styles in rhetoric or visual arts, including dramatic, poetic, and musical forms. All these forms are significant to PA.

Data on the society's formal and informal leadership positions where the incumbents are key communicators and opinion leaders.

Analysis of the reading and listening habits of the society.

Analysis of printed formats.

Analysis of media effectiveness. Also address freedom of the press issues, if any.

ENDNOTES

LIST PUBLICATIONS, DOCUMENTS, AND OTHER SOURCES USED IN PRODUCING THIS BPS. NUMBER TEXT REFERENCES SEQUENTIALLY WITHIN THE STUDY.

APPENDIX A

COUNTRY SUMMARY

Give the reader a brief overview of the subject country, its geography, and its people. These background data and statistics should include the following items:

Country. Identify the country, tell when formed, and show previous control.

Government. State briefly the type of government, method of appointing or electing leaders, and length of terms. List current leader or leaders and political power in country.

Size, location, and geographical subdivision. List the size of the area in square miles or kilometers, and give the general location. Show any geographical subdivision, such as coasts, mountains, and flatlands.

Population. State the number of people and the area density. Show the heavily populated areas.

Languages and dialects. List the official language, languages spoken by the population, percentage of population speaking each language, and areas of the concentrations.

Labor. Outline the total work force, the area of endeavor, and the percentages.

Religions and sects. List the religions of the area and the percentage of the population that practices each.

Education. List the types of systems and the primary emphasis of each.

Literacy rates. Latest statistics.

Health. List the general conditions of the populace. Describe the medical care system.

Justice. Describe the justice and court systems.

Administration. Outline the breakdown of the governmental and judicial districts, counties, or precincts.

Transportation. List the methods of transportation available and include the total capabilities. This information may include the number of airlines, airfields, kilometers and kinds of highways, and kilometers of waterways and depth.

Armed forces. List organization and strengths.

Police. List the types and areas of responsibilities.

APPENDIX B

GOVERNMENT STRUCTURE

List the formal government structure, key positions, and organizations of the country. Outline the chain of government control, including political parties, if applicable. A schematic diagram may be helpful.

Include only branches of government and their key positions, not names.

APPENDIX C

COMMUNICATION FACILITIES

Give a brief overview of the subject country's media facilities. Include the facilities' locations and levels of technical sophistication. Cover printing, publishing, and the distribution of radio and television receivers, studios, transmitters, and relay facilities. Include news service facilities. Write this appendix as if the U.S. PA units will use this equipment or contract for its services. Since PA personnel may get operating supplies or repair parts from in-country sources, provide the following information:

- Make.
- Model.
- Type.
- Series.
- Name of manufacturer.

Any other technical information on the repair or operation of this equipment.

GLOSSARY

Prepare a glossary that lists in alphabetical order all acronyms and foreign words used in the study. List also all words and terms that have special meaning and need to be defined.

BIBLIOGRAPHY

List the source material used. Include the name of the author, the title of the publication, the publisher, and the date of publication.

DISTRIBUTION

Dissemination is accomplished by the originating agency for the recipients within PA. Include in the distribution list the identification of recipient agency (by code), the number of copies furnished, and the office symbol of the recipient.

BRIEFINGS AND PRESS CONFERENCE FORMATS

NEWS BRIEFING AND PRESS CONFERENCE FORMAT

Before the Presentation

Know your publics
Anticipate interests, concerns and questions
Consider the latter in preparation

Prepare your presentation
Develop a strong introduction
Develop a maximum of three key messages
Assemble your supporting data
Prepare audiovisual aids
Practice

Prepare for answering questions
Anticipate what questions will arise
Prepare answers to those questions
Practice questioning and responding

The Opening Statement

A strong opening statement sets the tone for the press conference or news briefing and is crucial in attempting to establish trust and build credibility. The elements of a strong opening are:

Introduction
A statement of personal concern
A statement of organizational commitment and intent
A statement of purpose and plan for the meeting

Key messages and supporting data
A maximum of three “take-home points”
Information to support the key messages

Conclusion
A summarizing statement

Total time for all presenters should be 15 minutes or less. Do not have too many presenters. Three is usually sufficient.

Introduction

Remember that perceived empathy is a vital factor in establishing trust and building credibility and your publics assess it in the first 30 seconds.

Examples are:

Statement of personal concern: “As a resident of this community I’m interested in the safety and well-being of our families and neighborhoods.”

Statement of organizational commitment and intent: “ I’m here to share with you the knowledge and confidence I have in the military’s ability to assist the citizens of our community. They have been trained in their occupational skill to assist with the task at hand.”

Statement of purpose and plan for the presentation: Today I would like to share with you the most current information regarding the (incident.) I will also be available to answer additional questions or to continue the discussion.

Key messages and supporting data

The key messages are points you want your publics to have in their minds after the presentation. They should:

Address central issues.

Be short and concise.

Examples are:

“We have trained personnel and emergency response plans in place to aid in protecting the health, safety and welfare of the public. We are working with local and state officials to handle the incident.

“We are actively responding to the emergency....”

To develop your key messages:

Brainstorm

Think freely and jot down all pieces of information you wish to communicate.

Select key messages

Identify the most important ideas. Repeat the process until you list is down to three items.

Identify supporting data

Other information you listed probably provides support to your key messages. Organize it to reflect this.

Conclusion

Restate verbatim your key messages.

Add a future action statement --- What is your organization going to do about this problem in the short and long term?

Appendix I

WAIVER OF LIABILITY STATEMENT

Whereby, I NAME passport no: _____
am about to travel with _____ forces, and whereas I am doing so entirely upon my
own initiative, risk and responsibility; now, therefore, in consideration of the permission
extended to me; I do hereby for myself, my heirs, executors and administrators, remiss,
release and forever discharge _____ and its member officers, agents and employees
acting officially or otherwise, from any and all claims, demands actions or causes of
action, on account of my death or on account of any injury to me or my property which
may occur from any cause during my stay, travel as well as all ground, flight or sea
operations incidents thereto.

I also agree to withhold any classified information, which may be accidentally disclosed
to me, and to respect embargo restrictions, which may be imposed on information which,
if disclosed, may jeopardize operational security. During my stay with _____ forces, I
will not interfere with operations. I understand that failure to comply with these security
restrictions will result in the loss of authorization to accompany _____ and may result in
cancellation of my press registration.

Signature

Witness

Please provide the following information for a person to be notified in an emergency
(preferably next immediate relative):

SAMPLE PRE-DEPLOYMENT CHECKLIST

INTRODUCTION

A multitude of factors make each deployment uniquely different from other deployments. Each factor must be carefully examined to determine its impact on the mission, actions before deployment and what equipment is taken.

(Unit Basic Load). In all other instances the chances of drawing the UBL are remote. Certainly if the unit is deploying for war it would draw the unit's basic load of ammunition Exercise or deployment duration will affect the quantity of expendable supplies.

This checklist, like all others, is based on what has occurred before and what we have come to expect in the future. As equipment and missions change, so too must the checklist. Bottom line, expect the unexpected and react accordingly; use the checklist as a guide to help you through deployment preparation. Add to it whenever the need arises.

CHECKLIST ITEMS

1. Each HQ element and unit should have a 45-day supply of expendables identified and set aside for contingency operations. This supply should be inventoried quarterly and stockage rotated accordingly.
2. Maintain and update a master list of all areas and topics that can affect individual readiness. This includes all shots, dental status, family support plan, check to bank, etc.
3. The PAO or detachment commander (or deploying team leader) should:
 - a. Review and update PA estimates annexes and plans.
 - b. Obtain and comply with applicable published Public Affairs Guidance.
 - c. Inventory and inspect TOE equipment for accountability and serviceability before deployment.
 - d. Figure total weight and cube of equipment before moving to assembly area.
 - e. Check dependency clause in TOE document or OPLAN to determine who will be supporting and who is supporting us. Ensure responsible parties know the relationship. Establish liaison with units OPCON; attached or any new parent organization.
 - f. Ensure accompanying equipment not on TOE is listed on interim authorization document (such as facsimile machines or cellular phones).
 - g. Prepare an internal OPORD for your element detachment or team.
 - h. Review the essential elements of friendly information (EEFI) contained in the base OPLAN/OPORD and ensure each soldier understands them.
4. All leaders must consider the need for the following:
 - a. Will flak vests be required?
 - b. Should each soldier take a footlocker instead of a dufflebag?
 - c. Will weapons' carrying/security cases be needed/available? (Will weapons and protective masks be required?)
 - d. Will desert or jungle uniforms be required, and if so, what fund can be used to pay for alterations, sewing and patches?
 - e. Is there an opportunity for a service contract to be initiated at the deployed location? Cameras, video, computers, etc.? if not, and cameras go down and must be swapped out, what is the plan?
 - f. Will the deployment be considered TDY? If so, who prepares orders? What fund cite will be used? Are rental vehicles available? (Are we TDY under field conditions and required to carry meal card?)

- g. Will a fund cite be made available after redeployment to pay for repairs? (Make this request soon after being tasked - don't wait until redeployment to find out you've got to use unit funds to repair equipment.)
- h. If departing from location other than current station, what type of transportation to that location is to be used for personnel and equipment?
- i. Will personnel and equipment travel together at all times? (Insist that they do whenever possible!)
- j. Does each team have a credit card holder for authorized payments or purchases?
- k. Has an express mail system been established to ensure timely transit of products to home station? With what frequency? (If you are the ARFOR or sub-JIB, have the division PAO's/PAD's establish a plan to get products to you for review, release or use).
- l. Under what conditions will the MPAD or team(s) work? Fixed site, field conditions, etc. Will we need to deploy our own tents for sleep and work?
- m. Is the heat a condition that will affect computers, cameras, batteries, etc? If so, is air conditioning available? Refrigerators for film? What about humidity problems? Air conditioning may help but can dehumidifiers do better...consider charcoal bags placed in shipping cases.
- n. From what unit(s) do we draw support...rations, billets, fuel, etc.?
- o. If one team is deployed for a lengthy duration, is there an opportunity for the teams to be rotated?
- p. If deploying a risograph or other commercial printing machine, what quantity of copies and frequency (daily, weekly) is desired? What is the plan for distribution of copies? What is the plan for paper replenishment?
- q. Has every effort been made to ensure deployed asset has commercial phones available to assist transmitting digital photographs, responding to query, accidents and incidents, fax capability, etc.
- r. Has unit/team packing list been carefully checked to ensure the easy-to-forget yet must- have items are not forgotten. Glue sticks, chalk, scotch tape, blank overheads, etc.

EXAMPLE OF MEDIA OPERATIONS CENTER

Operations of a media center will need the following support:

- Communications
- Vehicle support (day-to-day operations and media transport -- tactical or non-tactical as needed)
- Billeting and rations for media center personnel
- Admin support personnel for 24-hour operations
- Office space (hard site if possible) and power as needed

Figure L-1. Media Operations Center

Appendix M

NEW MEDIA INQUIRY FORMAT (SAMPLE)

This format is intended as an example only and should be adapted to local needs and SOPs.
In addition to query forms, PAOs should maintain a separate log of all inquiries.

MEDIA QUERY SHEET

Query Number: _____

Deadline: _____

CALLER'S NAME: _____

CALLER'S NEWS ORGANIZATION: _____

CALL TAKEN BY: _____ TIME: _____ DATE: _____

QUESTION (use reporter's precise wording): _____

RESPONSE (if written release is made, attach a copy): _____

SOURCE OF INFORMATION/COORDINATION (e.g., G-3, surgeon): _____

RELEASED TO: _____

TIME/DATE: _____

RELEASE METHOD: In Person _____ Phone _____ News Release _____

RELEASED BY: _____ RELEASE NUMBER: _____

Appendix N
GUIDE FOR MEDIA INTERVIEWS

GUIDELINES

1. Considerations

- a. When human safety or other serious concerns are involved, deal with those considerations first.
- b. Communicate only information that is approved for external distribution. Always tell the truth.
- c. Know to whom you are speaking. Get the person's name and telephone number, if necessary.
- d. Do not be intimidated. You may tell a reporter that you need to clarify an important matter before you can answer questions.
- e. Talk from the public's viewpoint. Avoid jargon. Speak within the audience's frame or reference.
- f. If the questions do not lie within the framework of approved statements or within your area of expertise, find the appropriate technical advisor or spokesperson.
- g. State the most important fact at the beginning. Place your own headline on the answer.
- h. Attack problems in your answers, not people.
- i. Do not repeat offensive or negative language. Do not let other people put words in your mouth.
- j. Direct questions deserve equally direct and forthright answers.
- k. Do not exaggerate the facts. Listen to how your answer "sounds" when spoken.
- l. Ignore cameras and microphones. Talk to the reporter.
- m. During videotaped interviews, it is all right to stop your statement and start over.
- n. Do not say "no comment." Explain why you do not have an immediate answer.
- o. Keep your composure, even if a news reporter gets snappy.
- p. Be prepared to provide sufficient evidence for statements you make.
- q. Be especially alert about photos. You have little control over photos taken off military reservation property, but you have every right to control photos taken on the military reservation.
- r. Be aware of your surroundings and follow local OPSEC rules when determining interview location

2. What will be asked?

- a. What happened and where? When did this occur

- b. Are there injuries or deaths as a result? How many and to whom?
- c. What actions is the unit taking to control the situation?
- d. Have chemicals or other hazardous substances been released into the environment? What kinds? How much?
- e. What types of hazards are presented to people off-site?
- f. Have off-site emergency response personnel been notified? Which ones?
- g. Are unit operations shut down?
- h. Has the site or facility been evacuated?
- i. How many people are employed at this site?
- j. What do you do at this site?
- k. How old is the facility? Does it meet current regulations?
- l. Why did this situation occur? (DO NOT SPECULATE.)
- m. Are there safety rules covering the situation? Were they violated?
- n. Has a Site Emergency Response Plan been activated? What does that involve?
- o. Tell me about your organization?
- p. Will this situation have national ramifications, or will its effect likely be limited to a single site or region?
- q. How much money is this going to cost the taxpayers?
- r. Is there insurance coverage for the loss or damage? How much?
- s. Are commanders handling the situation locally or is a higher headquarters taking control?
- t. Has this occurred anywhere within the unit before? Why weren't you ready?
- u. What do your soldiers think about this situation?
- v. For accidents and incidents, don't speculate causes. Use "ongoing" investigation statements.

Appendix O

MEDIA RESEARCH AND ANALYSIS

AN INTRODUCTION

Since the early part of the 20th century, when there was almost no interest in the size of audiences or in types of people that comprised various audiences, business leaders and their organizational communicators have increasingly come to rely on research for nearly every major decision they make. This expanded demand for information has created a particular demand for media communication research capabilities, specifically -- the development of a scientific basis for media analysis and media effects.

The importance of mass communications research and media analysis is partly due to the realization that gut feelings or reactions are not entirely reliable or credible bases for decisions. Although common sense is often accurate, Army commanders and other decision-makers need additional, more objective information to evaluate problems, especially when lives are at stake. Thus, the past 50 years have witnessed continuing evolution of media analysis, combining research and intuition to create a higher probability of success.

This evolution has resulted in a "scientific" approach to media research known as media content analysis.

SCIENTIFIC RESEARCH: A DEFINITION

Scientific Research is defined as a **"systematic, controlled, empirical, and critical investigation of hypothetical propositions about the presumed relationships among observed phenomena."** This definition contains the basic terms that are necessary in defining the method of scientific research and describes a procedure that has been accepted for centuries. In the 16th century, for example, scientist Tycho Brahe conducted years of systematic and controlled observation to prove wrong many of Aristotle's theories of the universe. By gaining an understanding of the phenomena, he challenged the accepted beliefs and knowledge of the time with his own hypotheses. Thus, scientific research was begun.

Whether we realize it or not, we all conduct research as a matter of course in our day-to-day life whenever we speculate about the possibility of something -- we start with an idea or concept and test it.

All research begins with a basic question or proposition about a specific phenomenon -- for example, Why do Americans usually support the soldiers within the Army when they may not support the operation the soldiers are involved in? What factors determine why Americans will support the political justification for military involvement? What types of messages are most effective in garnering support for American forces?

The answers to these questions can be forecast to some degree with well-designed research studies. There are some difficulties, however. The Army media analyst faces the problems of determining which data collection methods can most accurately provide answers to the questions at issue, and in gaining adequate access to information prior to and during military operations. In the pages that follow, we will describe the methods and procedures PA professionals may use in overcoming these difficulties.

RESEARCH APPROACHES

There are several research approaches or "methods of knowing" which have been used to conduct studies: intuition, authority, and science.

In the **intuition** approach, one assumes that something is true because it is "self-evident" or "stands to reason." An example of this type of thinking would be if some Public Affairs leaders resist efforts to perform area studies because they believe they already "know" their AO.

The **authority** method seeks to promote a belief in something because a trusted or credible source says it is true. Here, the emphasis is on the source, not the methods the source may have used to gather his information.

The **scientific method** approaches learning as a series of small steps, with each step identifying more specific information and leading to a more clearly identifiable conclusion.

For example, one study or source provides only an *indication* of what may or may not be true; the "truth" is found only through a series of objective analyses.

This means that the scientific method is self-correcting in that changes in thought or theory must be continually reviewed, that issues and situations require constant monitoring.

The scientific method has become a valuable tool to produce accurate and useful data in mass media research. This annex focuses solely on the scientific approach and forms the fundamental basis for media content analysis in Army Public Affairs.

MEDIA RESEARCH: THE SCIENTIFIC METHOD

The goal of Public Affairs media research is to provide the methodology to support situational assessment, planning and decision-making that is fast, inexpensive, reliable and valid. The application of scientific methodologies to media research by Public Affairs personnel accomplishes this goal.

Five basic characteristics, or tenets, distinguish the scientific method from the other methods of research. A research approach that does not follow these tenets cannot be considered a scientific approach:

- **Scientific research is objective.** Science tries to rule out eccentricities of judgment by researchers. When a study is undertaken, explicit rules and procedures are constructed and the researcher is bound by them, letting the chips fall where they may. Objectivity also requires that scientific research deal with facts rather than interpretations of facts.

- **Science is empirical.** Researchers are concerned with a world that is knowable and potentially measurable. (Empiricism derives from the Greek word for "experience.") Analysts must be able to perceive, understand, and classify what they study and reject nonsensical explanations of events. For example, a newspaper editor's claim that declining readership rates are "God's will" would be rejected by scientific researchers because such statements cannot be perceived, classified or measured. Experience shows that there are usually easily identifiable reasons for declining readership.
- **Scientific research is systematic and cumulative.** No single research study stands alone, nor does it rise or fall by itself. Astute research analysts always use previous studies as building blocks for their own work. One of the first steps taken in conducting research is the review of all available literature on the topic so that the current study will draw on the heritage of past research.
- **Scientist attempt to find order and consistency in their findings.** In its basic form, scientific research begins with a single, carefully observed event and progresses ultimately to the formulation of theories and laws. A theory is a set of related propositions that present a systematic view of phenomena by specifying relationships among concepts. Researchers develop theories by searching for patterns of uniformity to explain and describe the information collected.
- **Scientific research is predictive.** Science is concerned with relating the present to the future. In fact, scientific researchers strive to develop theories because they are useful in predicting behavior. The importance of theories lies in their ability to predict an outcome or an event successfully. If a theory generates predictions that are supported by data, and the results are always the same, the theory can be used to make predictions in other similar situations.

MEDIA ANALYSIS STEPS

Evaluation of a problem must follow a standard sequence of steps to increase the chances of producing relevant data. Analysts who do not follow a prescribed set of steps increase the amount of error possible in the study.

These steps are:

- Select a topic (issue, situation, perception, or belief).
- Review existing research and other available information on the topic.
- Develop hypotheses and research questions.
- Determine an appropriate methodology, format or design.
- Collect relevant data.
- Analyze and interpret the results.
- Present the results in appropriate form (Information Paper, PA Study or PA Estimate)
- Validate and replicate the study when necessary.

The use of the scientific method of research is intended to provide an objective, unbiased evaluation of data pertaining to an issue or event. To investigate hypotheses systematically, media analysts must follow these steps. However, merely following the eight steps does guarantee that the research is good, valid, reliable or useful.

A countless number of intervening variables (influences) can destroy even the most well-planned research effort. Unanticipated events occurring during the research period may impact the results and they must be accounted for during the process. However, PA analysts must remain focused on the purpose of the research effort and not lose sight of the original objectives.

STEP 1 -- SELECTING A TOPIC, DETERMINING RELEVANCE

Selecting a research topic is usually not a concern for Public Affairs analysts -- planning guidance, current situations, and most importantly, the operational issues confronting our commands, will guide the application of media content analysis. In most instances, the Public Affairs analyst will receive planning guidance well in advance of an operation, which will help determine the issues to be addressed.

Once the basic subject has been chosen, the next step is to ensure that it is relevant to the operation or situation at hand. This can be accomplished by answering six basic questions.

- What is the goal of this research effort?
- Is the subject too broad?
- Can the subject really be studied?
- Is the subject significant?
- Can the results of the research be generalized, communicated and understood?
- Does the issue lend itself to analysis?

Underlying all eight steps of the Media Analysis process is the necessity for validity. In other words, are all eight steps (from topic selection to data analysis to presentation and interpretation) the correct ones to follow in trying to answer these questions?

The answers to these questions will help focus the research you must do, make information gathering easier, and ensure the results are valid.

STEP 2 -- REVIEW OTHER RESEARCH AND INFORMATION

Media analysts should always begin studies by consulting all literature, research, and other information available on the topic. The review provides information about what work has been done, how it was done, and what the results were as they apply to a given subject. It not only allows analysts to learn from (and eventually add to) previous media research, but also saves time, effort and money.

The review also helps to identify the facts pertaining to the situation being studied.

Completed media content analysis also provides a starting point for PA leaders who will follow in your position after you move on.

STEP 3 -- DEVELOP HYPOTHESES AND RESEARCH QUESTIONS

After the general research area has been identified and the existing information reviewed, the analysts must state the problem or issue as a workable **hypothesis** or **research question**.

(Example: "The American public is losing confidence in the Army's ability to protect its soldiers, resulting from the media's portrayal of Army leaders as negligent and soldiers as lacking competence in avoiding fratricide.")

A hypothesis is a formal statement regarding the relationship between variables and is tested directly. In the example cited above, those variables are the news media, the messages they send, and the perception and understanding of those messages by the American public. With a hypothesis, the predicted relationship between the variables is either true or false. Identifying the degree of "trueness" or "falseness" and their implications is essential to the development of information campaign strategies.

On the other hand, a research question is a formally stated question intended to provide indications about something, and is not limited to the relationships between variables. Research questions are generally used in situations where an analyst is unsure about the nature of the problem under investigation. The intent is merely to gather preliminary information. Research questions are generally used to identify the focus and scope of a research project.

STEP 4 -- DETERMINE AN APPROPRIATE METHODOLOGY/RESEARCH PROGRAM DESIGN

Given the variety of situations facing Public Affairs personnel, different approaches to media research are required. Some issues lend themselves more toward survey methodology via telephone, E-mail, or standard mail; others are best attacked through in-person interviews. Still other problems necessitate a controlled evaluation situation designed to eliminate extraneous variables by targeting analysis to specific media types. (An example of this approach would be a study of how a newspaper covered a specific story over a six-month period.)

The approach selected by the analyst depends on the goals and purpose of each particular study. Regardless of whether the problems or issue being addressed is a local one, affecting only a fraction of a community audience, or a national issue affecting us all, all research requires a design of some type. All procedures, including all variables, samples, and measurement instruments, must be pre-designed with hypothesis and research questions in mind.

There are four characteristics of research design that should be noted if a research study is to produce reliable and valid results:

- **Accurate setting.** For a study to have external validity, the study must be conducted as an historical account of the situation during the time frame studied. The analyst must have a clear understanding of the events unfolding around him and attempt to document as much related information as possible.
- **Clear cause-and-effect relationships.** The analyst must make every attempt to identify spurious dependent relationships and

weed them out. The results of a study can be interpreted with confidence if and only if all confounding effects are identified.

STEP 5 -- COLLECT RELEVANT DATA

STEP 6 -- ANALYZE AND INTERPRET THE RESULTS

STEP 7 -- PRESENT THE RESULTS IN APPROPRIATE FORM (PA STUDY OR PA ESTIMATE)

STEP 8 -- VALIDATE AND REPLICATE THE STUDY WHEN NECESSARY

Appendix P

INFORMATION PROGRAM EVALUATION

METHODS

How our audiences perceive the Army is critical to the success of all operations we are involved in. Internally, the Army's people require certain information to function effectively. The more they know and understand, the better they perform. Information about the operation, the unit's particular mission, how the commander feels about the situation, and a host of other subjects are of interest to both soldiers and civilians. Externally, the general public has specific needs for information about what their Army is doing and how they are doing it. This appendix explains methods for measuring success in the conduct of PA information programs.

Command information is communication between the commanders and those commanded. Command Information is different from the Public Affairs function of Information Provision in that it is the commander's responsibility to inform his people. Commanders must communicate their intentions and the troops, community, indeed the general public, must know his concerns and intentions. It is especially important to note that PA Information Provision techniques and procedures are just one channel that the commander may use in communicating to his audiences.

A poorly recognized fact is that the communication links between the commander and his audiences occur on various levels and assorted channels. This type of communication no longer fits the "top-down" communications model of the cold war Army. The explosion of today's digital technology has provided individual soldiers, civilians, family members, and the general public the ability to bypass rigid, controlled, vertical communication systems in favor of the common user, multidirectional, reciprocal, simultaneous, real-time transactive communications systems. Americans have the power to bypass the gatekeepers and ignore canned, shoddily produced, dated industrial age information products, in favor of accessing on-line information services or the Internet directly. Information is passed in all directions, continually. These audiences will have access to many more sources of information, which makes evaluating the effects of Army PA Information Programs all the more difficult.

This explosion of information technology has also highlighted how critical it is for PA elements to stay up to date on communications technologies, information services, and socio-economic trends of these forces at work.

Despite the rapid change in the information environment, the general steps for evaluating information program effects has remained the same:

- Determine the command's mission and the commander's method for accomplishing that mission.
- Identify all the various audiences interested in information related to the command, its members, and the mission.

- Identify a public opinion baseline -- the template against which new public opinion information will be compared.
- Gather identify all the messages communicated and identify which audiences' received such information.
- Gather information on the information program impacts. This is done reviewing unit newspapers, letters to editors, responses to information programs fact sheets, formations, surveys, and interviews. Check related bulletin boards on all on-line information services. Check related Newsgroups on world-wide-web nodes, which commonly carry related information. Monitor discussion groups on on-line services.
- Attend commander's calls, staff meetings, formations, briefings, and other gatherings where audience reaction, troop morale and like information will be discussed.
- Evaluate the knowledge of the targeted organizations. This is accomplished through in-person question/answer surveys and interviews, E-mail surveys, and electronic town hall meetings, etc.
- Coordinate with other staff elements addressing similar information issues (SJA, Chaplain, PMO, IG, etc.).
- Produce a summary of information gathered in an impact assessment.

Appendix Q

PRINCIPLES OF PA SERVICE AND STANDARDS

INTRODUCTION

1. This checklist identifies the primary tasks associated with the functions of Public Affairs, and establishes standards for successful accomplishment of those tasks. Standards of service equate to minimum exceptions of an operational commander and will be used to judge unit readiness, leader effectiveness, and individual soldier performance.

2. The following definitions apply to this checklist:

Austere: No existing PA units, assets or Army signal information infrastructure available in area of operations upon deployment. Commercial communications infrastructure is not available. PA elements must perform all missions and provide all PA support using organic personnel and equipment.

Existing: PA units, assets and Army signal information infrastructure in place before deployment. Commercial communications infrastructure is available. Deploying PA element assumes duties of or augments organic PA elements. Existing personnel and equipment augmented by additional PA elements to accomplish PA mission and provide PA support.

FUNCTIONS/TASK	CONDITION	STANDARD
<hr/>		
Planning		
1. Perform Global Information Environment analysis	Existing	Austere
2. Develop PA Estimate (COAs)	Existing	Austere
3. Develop PA Strategy (plan)	Existing	Austere
4. Develop PA Guidance	Existing	Austere
5. Coordinate PA Annex	Existing	Austere
Media Facilitation		
1. ID media support requirements	Existing	Austere
2. Register news media	Existing	Austere
3. Coordinate media support	Existing	Austere
4. Provide media orientation	Existing	Austere
5. Coordinate news media interviews	Existing	Austere
6. Plan/coordinate news briefings	Existing	Austere
7. Establish Media OPS Center	Existing	Austere
8. Operate MOC	Existing	Austere

9. Provide media assistance/escort	Existing	Austere
Information strategy		
1. Identify target audiences	Existing	Austere
2. Identify information needs	Existing	Austere
3. Develop info themes/CMD messages	Existing	Austere
4. Gather info/develop products	Existing	Austere
5. Disseminate information to deployed forces	Existing	Austere
6. Disseminate information to families/home station audiences	Existing	Austere
7. Disseminate information to national/local news media	Existing	Austere
8. Disseminate information to general public	Existing	Austere
Public Affairs Training		
1. Identify training needs	Existing	Austere
2. Develop unit PA Training plan	Existing	Austere
3. Develop Family Spt Training Plan	Existing	Austere
4. Develop Senior LDR Training Plan	Existing	Austere
5. Conduct unit PA training	Existing	Austere
6. Conduct Family SPT Training	Existing	Austere
7. Conduct Senior LDR Training	Existing	Austere
8. Prepare SMEs for Media interviews	Existing	Astere
9. Evaluate training efforts	Existing	Austere

PRIVACY ACT/FREEDOM OF INFORMATION ACT

INTRODUCTION

This checklist addresses personal information about soldiers and any living persons that can or cannot be released under the provisions of the privacy act.

CHECKLIST ITEMS

- AGE (date of birth) = releasable. This information is public record.
- HOME OF RECORD/PRESENT ADDRESS = In most cases, home of record can be released if no street address is given. There is no general rule for disclosure of this information. Widely different circumstances surround each incident, and judgment is made on a case-by-case basis. In most cases, the person's present geographical location may be provided (city, state), but not the street address. In each case, the desires of the actual person or next of kin should be considered.
- MARITAL STATUS/DEPENDENTS = RELEASABLE. This information is public record, including names, ages and sex of dependents.
- AWARDS/DECORATIONS/CITATIONS = releasable.
- EDUCATION/SCHOOLING/SPECIALTY = releasable. Major area of study, school, year of graduation, degree and specialty designator is releasable.
- RACE = In most cases, NOT releasable. However, where the fact of an individual's race is relevant in providing essential facts to the Press, it may be released (such as in a racially oriented protest or altercation.)
- CHARACTER OF DISCHARGE:
 - ADMINISTRATIVE = NOT releasable, unless the individual provides his written consent.
 - PUNITIVE = releasable. This includes discharges resulting from courts martial.
 - DUTY STATUS = releasable.
- PERSONNEL BOARDS:
 - Results of promotion boards and augmentation boards are releasable.
 - Results of administrative discharge boards and aviator flight boards are NOT releasable.
- PHOTOGRAPHS IN THE CUSTODY OF THE DEPARTMENT OF DEFENSE = releasable, unless they warrant an invasion of anyone's personal privacy.

Appendix S

PA GUIDANCE ON TERRORISM COUNTERACTION

In view of the continuing media interest in the subject of terrorism, the public affairs guidance contained in this message is provided to assist PAOs in responding to media queries and in developing local contingency plans.

TERRORISM IN GENERAL

- a. **U.S. POLICY.** All terrorist acts are criminal. The U.S. Government will make no concessions to terrorists. Ransom will not be paid and nations fostering terrorism will be identified and isolated.
- b. **RESPONSIBILITY.** Department of State is the lead agency for response to international terrorist incidents that involve U.S. military personnel and facilities outside the U.S. The administrator of the Federal Aviation Administration is responsible for terrorist incidents that affect the safety of DoD personnel or property aboard an aircraft in flight. When terrorist incidents occur at military installations within CONUS or its possessions (Puerto Rico, Guam, Virgin Islands, American Samoa, and trust territories), the FBI will be the lead agency. If the FBI declines to exercise its authority, military authorities may take appropriate action within the limits of their responsibility to resolve the incident.
- c. **NOTIFICATION.** All terrorist incidents should be reported immediately through channels, to OASD/PA. No public release of information regarding a terrorist incident should be made without OASD/PA approval except for cases involving public safety.

COMBATING TERRORISM

Combating terrorism can be divided into two major areas: counter-terrorism (offensive measures) and anti-terrorism (defense measures).

- Counter-terrorism. The following statement may be used in response to queries regarding counter-terrorist forces:
- "The U.S. Government has trained forces and equipment from all four services to cope with terrorist incidents. We have also said that command and control elements for these forces exist and have been exercised. These elements report to the Joint Chiefs of Staff, as do other command and control elements for military operations. We do not comment on any details concerning the circumstances under which these forces may be deployed, their identity, or tactics."
- Requests for interviews or filming of counter-terrorism training will not, repeat will not, be approved.
- Requests for photos of counter-terrorist forces personnel or their training will not be approved.
- Because of the clear association/confusion surrounding the relationship between special operations counter-terrorism forces,

all requests for interviewing or filming special operations forces and or training will be approved by OASD/PA.

- Questions beyond the scope of the above guidance should be referred to OASD/PA..
- Anti-terrorism. The following guidance is applicable to media request for information pertaining to anti-terrorism.
- DoD officials, senior leaders, commands and knowledgeable individuals may discuss the subject of anti-terrorism as it pertains to those areas/installations for which they are responsible.(Anti-terrorism measures and procedures should be discussed in a general manner without going into a checklist of specific details.)
- Media requests to film anti-terrorist training will be approved on by OASD/PA.
- Photos of anti-terrorist training should be forwarded through channels for approval.

QUERIES

In response to queries regarding a possible or real terrorist threat at a particular base/installation/activity the PAO may acknowledge, if appropriate, that increased security measures have been/will be taken without going into specific details of all the measures taken. PAOs may, when appropriate, acknowledge the obvious.

For example, increased security measures such as increased guards at the gate or additional patrols, if they are obvious to the public may, in some cases, be acknowledged. PAOs should, however, exercise care and prudent judgment in any discussion of these or other security measures, which have been/will be implemented.

Appendix T

BROADCAST OPERATIONS

This section focuses on the radio and television services provided by Armed Forces Radio and Television Service at the unified command level and the coordination necessary by Army component commanders to ensure operational area support. It identifies and explains the AFRTS mission and its capabilities. It also discusses planning considerations and theater broadcast information requirements.

AFRTS CONTINGENCY BROADCAST OPERATIONS

The scope of the ABS mission of providing AFRTS radio and television news, information and entertainment programming to DoD personnel stationed overseas greatly expands during wartime to include support of global contingency requirements. As new contingency plans are developed based on emerging joint and Army doctrine, ABS must consider how the additional broadcasting personnel and equipment resources needed to support a rapid deployment broadcasting mission can be obtained while simultaneously meeting increased requirements in existing unified command theaters. The immediate response necessary to meet contingency requires the development of AFRTS appendices to Unified Command Operations Plans (OPLAN).

Army Broadcasting Service (ABS) is the Unified Command AFRTS Planner (UCAP) for the U.S. Southern Command and the U.S. European Command. ABS also has Geographic Area Planner (GAP) responsibilities for U.S. Forces Korea (USFK). ABS and AFRTS networks within these unified commands are responsible for updating and maintaining appendix content under provisions of the American Forces Information Service (AFIS) Concept Plan for Peacetime and Wartime Operations for the Armed Forces Radio and Television Service (AFRTS CONPLAN 98-1) and DoD Directive 5120.20-R

Contingency and/or Wartime Plans define the Mobilization/Contingency mission. Force structure to support these plans may be packaged as blocks, deployable units or detachments for ease of planning.

According to CONPLAN 98-1 and DoD Directive 5120.20-R, Unified Commanders and Subordinate Commanders, with the advice of ABS, determine the type of AFRTS Flexible Response Option (FRO) necessary. Unified and Subordinate Command support is required for the current levels of support contract and for any mission changes which affect AFRTS service in the CINC's area of operation.

AFRTS Mission

Provide live news, information and entertainment programming, free of censorship, to all DoD elements in place or deployed worldwide.

Provide U.S. military theater commanders with sufficient electronic media resources to effectively communicate DoD, Army, theater and AO command information.

Concept of Operations

Existing facilities and services will be the first AFRTS assets used to respond to AFRTS taskings.

Upon implementation of a Contingency Plan or OPLAN, AFRTS assets in the AO come under the direct operational control of the Unified Command for the period of the operation. When the operation is terminated, normal command relationships will be resumed.

The AFRTS Commander reports directly to the Unified Commander responsible for the theater of operations.

The AFRTS Commander retains direct command authority over AFRTS personnel and equipment.

The AFRTS Commander is responsible for all AFRTS matters concerning the operation, accomplishing direct coordination for the Unified Command with AFIS/AFRTS for all AFRTS issues requiring AFIS/AFRTS action, and managing all AFRTS assets involved in the operation in accordance with the AFRTS CONPLAN 98-1.

The AFRTS Commander will be a designated member of all public affairs meetings as a member of the staff.

The AFRTS Commander is authorized direct coordination with other members of the unified command's staff to work specific AFRTS support requirements.

All requests for command internal information or emergency announcements from AO organizations or personnel will be forwarded to the director of public affairs for approval.

All public information released by public affairs officials will be available for AFRTS use.

AFRTS radio and television electronic news gathering (ENG) will be dedicated for the AFRTS "on-air" mission and in direct support of the Unified Commander's internal information program.

AFRTS will provide full, factual and timely internal information and news to military audiences in the AO, consistent with national and operational security, and host country sensitivities.

AFRTS will follow Operations security (OPSEC) and communications security (COMSEC) rules.

AFRTS OPERATING PARAMETERS

AFIS is responsible for all AFRTS satellite programming services and overall policy and guidance for their use.

The AFRTS Broadcast Center (AFRTS-BC) is responsible for providing non-local and non-theater radio and television programming material to AFRTS facilities in the AO, except as outlined in Flexible Response Options (FROs).

The Television-Audio Support Activity (T-ASA) in Sacramento, California, is responsible for providing technical and logistical support to AFRTS.

The AFRTS facility in the AO will provide service based upon initial Flexible Response Options (FROs) and continue operations until directed

to modify its services by AFRTS, the Unified Command or as the mission requirement dictates.

AFRTS will provide AO-wide announcements as required on both radio and television in order to facilitate unified command needs.

At unmanned repeaters and cable distribution systems, local officials may have AFRTS personnel make local announcements, if possible, in coordination with the AFRTS commander or on-site command representative, if approved by the director of public affairs for the operation.

AFRTS NETWORK COMMANDER OR DESIGNATED REPRESENTATIVE IN THE AREA OF OPERATIONS

The AFRTS network commander or designated representative will be co-located with the unified command director of public affairs.

The AFRTS network commander or designated representative will have a command function with direct operational command authority over all resources assigned to support the AFRTS mission in the AO.

The AFRTS commander or designated representative will ensure a logistics and engineering function responsible for providing advice and assistance to maintenance personnel assigned to AFRTS outlets, and maintaining unmanned equipment. This function will assist the AFRTS chief engineer in developing new equipment support requirements as changes occur in the AO.

The AFRTS network commander or designated representative will ensure internal information ENG coverage of unified command activities of interest to the members assigned in the AO. In joint service situations, Army AFRTS representatives may also be responsible for the production and duplication of radio and television internal information products for use at AFRTS outlets and television programming for DoD, or satellite cabled sites in the AO.

UNIFIED COMMAND RESPONSIBILITIES

The unified command provides logistic support for AFRTS. This includes vehicles, POL, and supply requirements in the AO as noted in the OPLAN. Also included is vehicle maintenance and POL for all AFRTS contingency vehicles. If additional forces are deployed to support AFRTS, the unified command assigns additional vehicles to support the expanded maintenance and production requirements.

If security and/or intelligence forces determine that AFRTS facilities have been identified as a potential target by hostile forces, the unified command will notify the AFRTS facility and provide security to targeted facilities.

If contract communications support is terminated during the implementation of the OPLAN, the unified command provides communications support for AFRTS use in the AO.

This includes existing long-wire or microwave systems for distributing the AFRTS signal and support for telephones, facsimile transmission and computer equipment for AFRTS.

If support cannot be obtained from existing assets, the unified command should be prepared to augment the AFRTS mission as outlined in the OPLAN.

The unified command provides personnel, administrative, vehicle and other logistic support for all AFRTS personnel assigned in the AO and those deployed to supplement that force. This includes unit line numbers and entry clearances required for all deployed personnel supporting the AFRTS mission.

The unified command obtains country clearance for construction of any temporary transmitter towers required due to expanded AFRTS service, which may occur as the operation unfolds.

The unified command provides electrical backup power for AFRTS facilities if contract services are terminated during the implementation of the OPLAN.

The unified command is responsible for obtaining necessary broadcast frequencies in consultation with the host-nation government to meet AFRTS broadcast requirements.

Flexible Response Options

Although each operation will differ, the following are general concepts of AFRTS Flexible Response Options (FROs) available for peacetime engagements, wartime operations and stability and support operations in an area where little or no AFRTS service exists or where crisis situations require a modification to existing AFRTS services. The unified command AFRTS planner (UCAP) is responsible for developing specific equipment, support and manning requirements to implement the AFRTS FROs that best support the specific operation.

The Unified Commander for the area of operations must request AFRTS radio and/or television services or for a change in present level of service before deployment. The Unified Commander requests AFRTS assistance through the unified command AFRTS planner responsible for the area of operations. The request will then be forwarded to ABS and AFIS for final approval.

FRO One: Direct to Ship (DTS) Service Support System. DTS is an U.S. Navy peacetime capability that provides news, sports, information and entertainment to audiences on ships at sea. A wartime adaptation of the service can provide immediate access to three radio and two television channels for land-based audiences including geographically separated units down to the lowest level. A deployable AFRTS kit containing an individual receiver decoder (IRD) provides service. This service provides a single-source 24-hour capability of receiving all services, but only one channel can be accessed at a time and no local or theater command information would be available.

FRO Two: Satellite Direct Radio and Television (SDRTV). SDRTV is an unmanned AFRTS satellite service that can be provided to virtually any land based audience on the globe with up to 10 stereo radio channels and six television news, sports, information and entertainment channels. In the European theater it will include a regionally generated signal. Service is provided at a single location using a deployable AFRTS kit containing a simultaneous receiver decoder (SRD) that provides a capability of receiving all services and accessing up to six radio and television programming sources at a time. As a public affairs option,

SDRTV provides an internal information data stream that can be accessed with the addition of a computer, printer and proprietary software to the SDRTV equipment package for use by public affairs activities in providing support to deployed populations. Unified command public affairs offices and the UCAP should consider coordinating the use of the additional capability whenever a manned public affairs activity is deployed.

FRO Three: Manned Radio Systems. Signal Distribution Systems. These deployable systems include audio and video transmission and cable systems that provide a capability to distribute, DTS, SDRTV or manned radio service to an expanded autonomous geographic area such as a base camp or Air Force base in an AO.

FRO Four: Manned Radio Systems. These deployable systems provide a capability for local, live internal information and radio news. Various types and sizes of local radio systems exist that can be used to establish a range of services from simple local break away “radio-in-a-box” to a full service facility with local production capability. Some of these systems will include radio transmitter that can provide limited signal distribution without deployment of FRO Three. This system can provide a limited single-source radio service to outlying populations that are not served by FRO One or Two, are not available or would not be appropriate programming sources.

FRO Five: MOOTW Management, Local TV and Network Live Radio. These deployable personnel and systems support the development of an AFRTS management function to oversee dispersed AFRTS operations and will add local television and network-wide live radio capability using organic distribution systems. The capability will establish a network to support operations in an AO comprising a large peacetime engagement of medium to long duration encompassing a large geographic area where the operations commander requires near real-time internal information capability. The system provides network administrative, computer, maintenance, engineering and operations support functions. These functions provide the unified command director of public affairs with AFRTS management expertise not normally available on the public affairs staff. The television service system is designed to produce AO information that can also be fed to the AFRTS Broadcast Center for rebroadcast to DTS/STRTV audiences worldwide.

FRO Six: Theater Satellite Radio and Television Operations (TSRTO). In a major regional conflict where large force deployments are planned the AFRTS Broadcast Center will dedicate one channel of radio and one television channel for use by the UCAP to broadcast directly to the theater of operations. Programming will include time shifting “prime time” so that each 12-hour shift receives prime time programming in the first four and-one-half hours of off time. In conjunction with FRO One or Two, this will provide a virtual network capability to the AO commander and the PAO. It will appear to the audience as if the broadcast was occurring in the AO when in fact it is originating from the Broadcast Center. Initial spots can be unsophisticated radio readers and character-generated (CG) messages on television. If there is a manned radio facility providing theater and operation-specific internal information in place, they will forward copies of all AO specific spots via computer to the Broadcast Center for use initially as television CG messages within the

dedicated TV channel. As with all internal information, they will be developed in coordination with the PAO in the AO. If there is insufficient AFRTS manning in place which would be the case if there were numerous geographically-separated operating locations, the internal information will be supplied, via computer, by the AO public affairs office. Base and component command PAOs will be advised of the scheduling of theater programming and encouraged to provide service-unique spots for use in theater. Service will continue until a significant drawdown occurs, the operation stabilizes to the point where local TV spots are not needed and the presumption of pre-conflict programming will serve the majority of the deployed population or an AO based network begins serving the operation.

Appendix U
COMMUNITY SURVEY

COMMUNITY SURVEY EXAMPLE

I.The area

- A. Geographical description
 - 1. Of areas surveyed--size of cities, counties.
 - 2. Of surrounding area, if pertinent.
 - 3. Climate, topography, annual and seasonal temperatures, rainfall, etc. (one sentence will suffice for each.)
 - 4. Are the industries dispersed or centralized? Attach a map of the Area indicating the location of the principal plants. The map should show the names and numbers of principal streets and highways furnishing access to these plants.
- B. Population
 - 1. Of city
 - 2. Of area.
 - 3. Of labor market area, if different from above.
 - 4. Breakdown by sexes, color, native or foreign born, educational level, percentage of homeowners, etc.
- C. Industrial data
 - 1. Types of industries and number of each, labor force of each, key products of the area, and additional data as considered applicable.
 - 2. Does one type of industry dominate the area? If so, give pertinent information regarding the industry.

II.Manpower

- A. Labor market rating
 - 1. Is department of labor market classification, a,b,c, or d?
 - 2. Include supporting statistical data.
- B. Unemployment
 - 1. Totals and percentages of skilled, semiskilled, and unskilled.
 - 2. What types of skills are most commonly available?
- C. Source of labor supply

1. Compared to the World War II years, what are the reserves of women, handicapped, older-age groups, part-time workers, and school graduates?
 2. Has there been much intermigration to total population?
- D. Occupational classification of area workers. What are the most common occupations of the area? The less common?
- E. Skills in shortage category. List, with numbers of each, if available. Make a comparison of this list with the national shortage list.
- F. Area wage schedules
1. List the wage schedules of major occupations and industries.
 2. How do they compare with national averages?
 3. How do they compare with neighboring areas? With competing areas?
- G. Requirement of defense industry in area
1. Is manpower available for present production schedules? Current planned production?
 2. What skills are lacking for production schedules, both present and future?
 3. Do employers ordinarily use training programs? If so, give some Examples.
- H. Other pertinent information
1. Include current work stoppages, if any; record of work stoppages During last 10 years.
 2. Are workers highly organized? Principal unions?

III. Industrial facilities

- A. Facilities suited or adaptable for defense production.
- B. List facilities with current and World War II products.
- C. Give current and capacity employment.
- D. Give types of machinery.
- E. What defense contracts are held or sought?
- F. Vacant factory space. Describe space and indicate production potential.

IV. Housing

- A. Housing regulations.
 1. Is it a critical defense housing area under public law 96? P. L. 139?
 2. Local rent control?
- B. Housing units available.
 1. Number for sale, including 1, 2, and 3 bedrooms. Price ranges. Are the prices reasonable?
 2. Number for rent, including above information. Apartments available. Number, size, price ranges. Are the rents reasonable?

3. Sleeping rooms available. Number, price ranges. Are the prices reasonable?
4. Building permits issued (in past 12 months)
5. Number for houses--1, 2, 3, or more bedrooms.
6. Number for apartments.
7. If houses, number for rent and contemplated rental prices.
8. Housing units contemplated .
9. Number and sizes. How many bedrooms?
10. Number of these for rent.
11. Estimated rental rates.

C. Builders

1. Adequate number of experienced builders?
2. Do they have trained skeleton force?
3. Can other necessary housing construction workers be secured?
4. Is land available? Under option?
5. Can materials be obtained?
6. What bottlenecks?

D. Building capital.

1. Is capital for the building of housing and rental units readily available? If so, on long- or short-term loans?
2. What are the sources of this capital?
3. Does the community object to construction of more housing units now?

V. Adequacy of housing

For present work force? For expanded production? (quote a figure or percentage, such As peak load in world war ii or 50 percent above present.) This figure should be adequate to cover planned defense expansion known to you at time of Survey.

VI. Other community facilities and services

Discuss each of the following items as to adequacy for the present work force and for an expanded work force; give specific facts for each, as pertinent (yes and no answers are not adequate.)

- A. Water
- B. Electric power
- C. Gas
- D. Sewerage

*Note: for items 1 through 4 above, describe sources of supply, capacity, reserve storage, current use, reserves on hand, plans for expansion--whether on hand or projected.

- E. Transportation: types and numbers
- F. Highway and road systems: are the roads serving the area adequate and in good? What is the present traffic load and the peak capacity of these roads? Describe any unsatisfactory factors. What action is contemplated or considered necessary to assure free traffic movement within the area? (survey requests will furnish, whenever possible, specified information on any industrial and

defense manpower requirement changes under consideration for the area.) Contact with local, state, and federal highway authorities should be made, if necessary, to explore fully this phase of the survey.

1. Schools: number of each type of school, crowding, shifts, new construction, etc.
2. Hospitals: number, number of beds, population per bed.
3. Doctors: number, population per doctor and per dentist.
4. Fire protection: size, ratios, and ratings.
5. Police protection: size, ratios, and ratings.
6. Shopping centers and shopping hours.
7. Recreational facilities: number of each type.
8. Churches: all denominations.
9. Sanitation service (garbage collection).
10. Laundries, dry-cleaning businesses, barber shops, beauty shops, etc.
11. Banking facilities (include arrangements for shift workers).
12. Hotels: number and number of rooms, scale of rates, etc.
13. Restaurants and other eating places.
14. Newspapers: number (morning, evening).
15. Municipal government (form, etc.).
16. Tax rate: local, county, state.
17. Cost of living index: get whatever information is available. Compare local figures to national index.

*Note: include reference material, maps, booklets, etc., If possible.

Appendix V

AUDIENCE SURVEY

Audience surveys systematically gather information about the effectiveness of CI programs and products as they relate to a particular group of people. The commander and the PAO to make decisions about management and direction of an internal information program or product use the results.

PUBLIC AFFAIRS REQUIREMENT

The PAO will conduct a readership survey at least every two years (every three years for the Reserve Components). Coordination with the DOIM for possible computer and analysis support is recommended. Additionally, AR 600-46 can provide information on conducting surveys. The survey will provide data on distribution effectiveness, reader awareness and acceptance, readership and perceived usefulness of standing features and topics covered, and opinions of the value and effectiveness of the publication. Repeated surveys will provide trend data.

The survey may include any or all of the 20 questions listed in the Readership Survey (RCS: SAOSA-223) (app H) in AR 360-81. However, surveys not using these tested questions must be pretested to ensure validity before being used in a survey. Survey respondents will be selected using probability-sampling techniques.

Informal surveys, such as those included in a newspaper or conducted randomly/haphazardly with a few people, are not substitutes for readership surveys. This does not preclude an editor from periodically publishing a coupon or set of questions to solicit informal feedback that is not statistically projectable.

Before administering the survey, the survey managers must coordinate with the agency that will provide response analysis to be sure questionnaires; answer sheets, data entry program, or any other materials are appropriate and usable. Survey conduct may be included in the command's CE publication contract and may also be contracted by the command for Army Funded newspapers, providing funds are available.

When civilian employees are surveyed, PAOs should also coordinate with the civilian personnel officer for local union notification requirements. Completed questionnaires may be analyzed by the local Director of Information Management (DOIM) to provide percentages of responses to survey questions. Where computer support is available (from the local DOIM or DRM), responses will be analyzed using a program such as the Statistical Program for the Social Sciences package. Questionnaires must be constructed using the parameters of available software.

A written discussion of findings and conclusions drawn from the survey will be forwarded within 60 days after the survey is completed through

the local commander, appropriate major command, to HQDA (SAPA-CI-PMN), Room 2E625, The Pentagon, WASH DC 20310-1510.

As a minimum, the report will contain the survey statistics, an analysis of the data, identification of strengths and problem areas (e.g., distribution, more sports, etc.), recommended improvements and changes to editorial policy, and an indication that the commander has reviewed the results.

Surveys may be conducted any time. However, no newspaper's survey report on file at HQDA should be older than 3 years (4 years for the Reserve Components). This allows for the time to conduct a survey.

A copy of the most recent survey will also be submitted with the annual CI Program Assessment Report (DA Form 510-R), unless the survey was previously submitted to the MACOM and OCPA-HQDA.

The PAO will conduct electronic media surveys at least every two years (every three years for the Reserve Components).

SURVEY ADMINISTRATION

Among the more common methods of conducting surveys are the mail survey, face-to-face interview, and telephone interview. The mail survey is the preferred method for purposes of this requirement, although other methods, managed properly, may be used.

Survey respondents will be selected in a totally random manner (e.g., simple random, stratified, or systematic, using probability sampling procedures). Survey managers will select samples, which achieve at least a minimum of a +/- 5 percent reliability (error margin) at the 95 percent confidence level.

Sample sizes shown for the various reliability levels (e.g., +/- 5 percent error margin) are the number of usable responses received, not the number of questionnaires to be sent out. For a population of 5,000, 357 usable responses will accurately reflect, to within +/- 5 percent, what the entire 5,000 member audience would have said, had it completed the survey.

Experience with mail audience surveys shows that they realize an approximate 30 to 35 percent response rate. Therefore, send out at least three times as many questionnaires as are needed for analysis. Remember that incentives encourage responses.

Maybe the local MWR office or similar staff agency could provide bumper stickers, discount coupons, or other incentive for completed responses.

FOCUS GROUPS

Focus groups. One of the most effective ways to learn how CI products are being received is to conduct focus group interviews. Focus group interviews are structured group discussions in which representative members of the audience are brought together to discuss one or more CI products or issues. These interviews or sessions can examine the effectiveness of products or programs, gain suggestions for improving existing products or programs, and determine the need for new products or programs.

The key to effective focus group interviews is proper planning. Focus group organizers must determine who will participate, and what are the

specific objectives of the session (e.g., what topics or issues will be discussed, what specific questions will be asked, what is to be done with the results, etc.). The method of selecting participants should be determined and the location for the meeting secured. While there is no optimal size for focus groups, generally groups of six to 10 individuals are manageable. Group makeup (officer/NCO/enlisted, men/women, military/civilian, active/reserve, retired/family member) depends on the objectives of the session. Generally, homogeneous groups are preferable. Often it will be necessary to hold more than one focus group session to obtain information needed to evaluate a particular CI program or product.

The moderator or group leader should be someone skilled in interview techniques and knowledge about the product or program being evaluated. It is often best not to have a high-ranking individual as the moderator with a group of junior enlisted or young family members, as free flow of information and opinions may be inhibited. The group leader must facilitate the discussion, not serve as an interrogator.

Focus group sessions should be informal. Participants should be encouraged to speak whenever they wish; the moderator should focus the discussion on the topics without being overbearing. If participants agree, it will be useful to videotape their comments for use in evaluating the session.

It is important that all group members understand that their honest opinions are being sought, and that the session is intended as a positive method of improving CI within the organization. No punitive actions should occur as a result of these sessions.

Appendix W

PA Lessons Learned

"What this century's history teaches us is that the Army's real strength is its ability to change and adapt to the period's requirements. Our ability to change was the key to victory in two world wars and a cold war, and it will be the foundation for our future success."

--General Dennis J. Reimer

INTRODUCTION

Explosive developments in information age technology have made the prospect of sharing lessons and ideas across a wide audience a reality today. With ready and easy access to E-mail and the Internet, soldiers can distribute documents, graphics, and photographs with lightning speed.

This appendix is based on an article published in the Center for Army Lessons Learned (CALL) ***News from the Front!***

This section provides public affairs officers (PAOs) with a tool for capturing observations and an outlet for rapid analysis and dissemination of tactics, techniques and procedures (TTPs) to the force. The initial focus is on defining and narrowing the scope of TTPs. It is important for officers and soldiers in the field to clearly understand the process before proceeding to methodologies of collection. The next section provides a structure for developing a narrative product for publication by CALL. Such a product will provide a coherent article of information, which can be quickly used by the force. The final section describes the observation-gathering process. Understanding the process for collecting data will prove invaluable to the operational planner and for producing effective training tools for the future.

DEFINITION AND LIMITS

Focusing the collection effort is central to capturing meaningful observations. Although CALL regularly sends combined arms assessment teams (CAATs) to major exercises and actual operations to gather observations, units from the field, including any public affairs section or detachment, can provide great insight by planning for the collection of information. In fact, only the Army as a whole can make CALL a continuing conduit of information for use by soldiers.

By using the structure and tools described below, units can provide useful TTP by establishing a collection effort as part of the originating operation order (OPORD), with almost no interference with normal operations. Indeed, the tools will enhance planning for future (and remedial) training by incorporating the capturing of TTP into the plan.

TTP are often limited to the specific operation or exercise. The function and use of TTPs are analogous to legal precedents. In law, if given

circumstances of a case are generally similar to a prior case, it is assumed that a judgmental decision for the present case should be the same. However, circumstances in law often have aspects that are unique and must be considered before rendering a new decision. When applying TTP, study prior situations in context and use the lessons prudently.

STRUCTURING THE PAPER FOR USE BY CALL

PAOs at all levels can build upon the after-action review (AAR) process in the plan by producing a publishable document. In almost all exercises, units learn and consequently implement improvement measures. By employing the structure below, units can effectively share information throughout the force -- not only from Combat Training Center (CTC) rotations but also from home-station training and exercises away from the training centers.

Do not view the structure below as a rigid construct. Rather, it should serve as a point of departure for unit writers. Although quantitative material is useful for commanders and researchers, make this document narrative in format. Use graphics to support the narrative, if possible. Bring together data into a cohesive product that other units can readily use without resorting to sifting through large amounts of charts, lists, and disjointed bullets.

- Type of unit. Describe the type of unit the PAO supported (mechanized infantry division, separate brigade).
- Context of event. Summarize the general setting for the exercise or operation. (See Exercises and Actual Operations below. More operational context information is provided in this section.)
- Commander's comments. If possible, the commander can provide a brief (one or more paragraphs) commentary on public affairs operations. Work closely with the unit's executive officer or chief of staff for such input.
- Interaction with PSYOP, Civil Affairs, Signal. As information operations continues to grow and doctrine is further developed, interaction between various agencies will also continue to expand. While ensuring coordination with PSYOP and civil affairs operations, PAOs will continue to recognize the separation in functions of the organizations required by law. Discuss the coordination measures used.
- Media Relations.
- Summary of events. Provide a summary of events. Were press conferences and interviews scheduled and executed? What was the pace of daily operations? What was the routine daily schedule?
- Command messages. In developing this section, answer the following questions in detail: What were the command messages? More importantly, did the command messages come through to print or broadcast? Were any command messages distorted or misinterpreted? How can clarity be improved for the next operation?
- Summary of higher headquarters' public affairs guidance (PAG). Write a one or two paragraph summary of the initial and follow-up PAG received from higher headquarters. (Provide a complete copy as an appendix.) Provide answers to the following questions

following the summary: How did PAG influence operations? Was the PAG clear and meaningful? Were excerpts used to create lower level command messages?

- **Media contacts.** Describe the types and numbers of media contacts. Did the unit encounter numerous print-journalist requests? Electronic requests? Were there patterns in the requests? What could a future media preparation package contain to answer some questions in advance? How did the PAO prioritize media access? Were major outlets afforded more opportunities?
- **Summary of Media Releases.** Summarize media releases in one or two paragraphs. What were the major themes? What media received the releases? Were releases used in stories? Were there any comments from members of the media about the releases?
- **Media Content Analysis.** During and following an event, gather press clippings and, if possible, record electronic media stories about the event. What was the nature of the coverage? What was the tenor of editorial comments? Did command messages get exposure? Was the content of articles generally accurate? What could PAOs do in the future to improve the accuracy of content?
- **Command Information Products.** The command information program in the field is fundamental in the minds of American

CIVIL WAR

"When the (Civil) war entered Pennsylvania, the Philadelphia Inquirer often sold up to 25,000 copies of a single issue to the men in the field. During a lull in the Battle of Cedar Creek in October 1864, observers later remarked that the first thing the men did along the line was to sit down, boil coffee, and pull out their newspapers."

soldiers. And, this phenomenon is nothing new to this culture.

- Because of this intense internal interest in events surrounding the operation and events back home, it is imperative that PAOs adequately address methods and practices used to inform the soldiers. Answer the following questions in the narrative: Did soldiers in the field receive consistent and timely information about operations and world events? What was the distribution method? How was it evaluated for effectiveness? Were reproduction resources available and used adequately?
- **Changes Incorporated in the Tactical Standing Operating Procedures (SOPs).** From the TTPs gathered, what changes will the unit make to the SOP? Briefly describe why the unit is making the change and what mechanisms to put in place to test the effectiveness of the change.

EXERCISES AND ACTUAL OPERATIONS

Operational information is important for the reader to understand the context in which the PAO operated. Provide the following information for

the CALL document to contribute to the reader's full understanding of the event(s):

- Mission - Summarize the unit's mission. (The focus here is not on the PAO's mission, but on the mission of combat headquarters.)
- Commander's Intent - This information is available on the OPORD. By incorporating this information, the reader will have an appreciation of the context in which the PAO operated. Emphasize the components of the intent:
 - Purpose
 - Method
 - Endstate
- New Equipment Used - Was new equipment available and used in the operation? Describe the equipment. Was it useful? What were the additional training requirements for using the equipment?
- New Techniques Used - Did the PAO incorporate techniques which are not described in doctrinal manuals? Describe the techniques employed.
- Structure - What was the structure of the PAO unit or shop? What manning -- required versus on-hand? (Note: Do not provide information that is classified under provisions of unit strength reporting (USR) regulations. Seek to provide a document that is free of classified material.)
- Operational Developments - How did the headquarters change its plan during the operation? How did the change(s) affect PAO operations? The descriptions here will bridge the gap between the original plan and its actual implementation.
- TTPs applied during the mission and for future operations - In bullet narrative, describe TTPs gathered in the operation. The bullets must contain sufficient detail for the reader to understand the situation and application possibilities for future operations. Support the bullets by providing individual observations (see TTP-Gathering Process below) as a combined appendix. The narrative in the base document must stand alone, with the appendix of individual observations providing additional detail.

TTP-GATHERING PROCESS

Units can contact CALL when developing plans for collecting TTP. CALL analysts can provide observer guidance, assist in delineating responsibilities of observers, identify documents or reference for use in developing a collection plan, and describe collection methodology.

- Observations. Individual observations assist in providing the basis for the narrative document described above. Use the form below to capture observations and develop a database for use in narrative development. Provide a copy of each observation to CALL as an appendix to the narrative. (Note: Any document published by CALL will not list units nor individuals by name. Refer to units by level ("the division" instead of "the 101st Airborne Division") and personnel by position ("a brigade chaplain" instead of "Chaplain Jones"). The purpose of CALL publications is to share ideas - not to point fingers.

- Observation Forms. The observation form ([Appendix A](#)) can be used for individual observations. A Microsoft Word version is available. Contact CALL via E-mail at call@leavenworth.army.mil or DSN 552-9571 (commercial 913-684-571) to receive a copy of the document. The document contains key components which aid the researcher in preparing analyses:
- Observer Name - The observer's name is used administratively only. No observer's name will appear in a CALL product.
- Administrative Information - Like the observer's name, unit information is used administratively only. Unit names do not appear in CALL products.
- Observation Indicators - Check all the appropriate blocks.
- Interoperability Indicators - Check all the appropriate blocks.
- Environmental Indicators - Check the appropriate block.
- File Name - Employ a system that differentiates each observation. One method is for observers to use name initials combined with sequence number and date (John Smith's first observation of May 5th would read, jsmay0105). Other systems are acceptable if plainly explained.
- Observation Title - Give the observation a brief, distinct title.
- Observation - In one sentence, summarize the observation.
- Discussion - Provide as much detail as necessary to provide a clear picture to the analyst or future reader. The length of the discussion will vary.
- Lesson Learned - In the context of your observation, provide a TTP.
- DTLOMS Implications - Describe how the observation impacts one or more areas in DTLOMS:
 - Doctrine
 - Training
 - Leadership Development
 - Organization
 - Materiel
 - Soldier Support

Include other media support, such as photos, sketches, or slide presentations in support of the narrative text.

Provide the narrative text, appendices and other material to CALL at the following locations: call@leavenworth.army.mil, or Department of the Army, Center for Army Lessons Learned, 10 Meade Avenue, Fort Leavenworth, Kansas 66027-1350.

In addition to maintaining and expanding a database of information, CALL publishes ***News From the Front!***, and a host of other publications for easy use by the force. Importantly, much of what is available has originated from the field -- from soldiers just like you. ***News From the Front!*** is published six times per year and provides a forum for a wide variety of topics of interest to the field. Other publications, including newsletters, CTC Bulletins, special editions, Handbooks, and more, focus on specific topics. Much of the published holdings of CALL can be found on the CALL website, <http://call.army.mil>, post libraries, or by contacting

CALL at the E-mail address listed above. Various search engines are available on the website to assist researchers.

CONCLUSION

Sharing information is possible with rapid and potentially colossal results. Leaders and soldiers who understand the TTP-gathering process can build plans for the future into every OPORD. By incorporating a plan to collect data and produce a clean narrative product for use by the force, soldiers throughout the Army gain maximum benefit from existing and future advancements in information technology. PAOs can focus on critical elements for successful media relations operations and command information programs in the field. Planners can easily adapt collection plans to exercises or actual operations -- anywhere in the world.

Learning is crucial for continued success on the battlefield. PAO planners must inculcate a practice of gaining a full understanding of the process and incorporating it into future exercises and actual operations.

Appendix X

MEDIA GROUND RULES

OPERATION DESERT STORM GROUND RULES

The following information should not be reported because its publication or broadcast could jeopardize operations and endanger lives:

(1) For U.S. or coalition units, specific numerical information on troop strength, aircraft, weapons systems, on-hand equipment or supplies (e.g. artillery, tanks, radars, missiles, trucks, water), including amounts of ammunition or fuel moved by support units or on hand in combat units. Unit size may be described in general terms such as "company-size, multi-battalion, multi-division, naval task force and carrier battle group." Number and amount of equipment and supplies may be described in general terms such as "large, small, or many."

(2) Any information that reveals details of future plans, operations or strikes, including postponed or cancelled operations.

(3) Information, photography and imagery that would reveal the specific location of military forces or show the level of security at military installations or encampments. Locations may be described as follows: all Navy embark stories can identify the ship upon which embarked as a dateline and will state that this report is coming "from the Persian Gulf, Red Sea or North Arabian Sea." Stories written in Saudi Arabia may be datelined "Eastern Saudi Arabia, near the Kuwaiti border, " etc. For specific countries outside Saudi Arabia, stories will state that the report is coming from the Persian Gulf region unless that country has acknowledged its participation.

(4) Rules of engagement details.

(5) Information on intelligence collection activities, including targets, methods and results.

(6) During an operation, specific information on friendly force troop movements, tactical deployments and dispositions that would jeopardize operational security and lives. This would include unit designations, names or operations and size of friendly forces involved until released by CENTCOM.

(7) Identification of mission aircraft points of origin, other than as land or carrier based.

(8) Information on the effectiveness or ineffectiveness of enemy camouflage, cover, deception, targeting, direct and indirect fire, intelligence collection or security measures.

(9) Specific identifying information on missing or downed aircraft or ships while search and rescue operations are planned or underway.

(10) Special operations forces methods, unique equipment or tactics.

(11) Specific operating methods and tactics, (e.g. air ops angles of attack or speeds, naval tactics and evasive maneuvers). General terms such as "low" or "fast" may be used.

(12) Information on operational or support vulnerabilities that could be used against U.S. forces, such as details of major battle damage or major personnel losses of specific U.S. or coalition units, until that information no longer provides tactical advantage to the enemy and is, therefore, released by CENTCOM.

* Damage and casualties may be described as "light," "moderate," or "heavy."

Glossary

AFRTS— Armed Forces Radio and Television Services

BOD—Broadcast Operations Detachment

C2 protect—command and control-protect—see **command and control warfare**

C2W—**command and control warfare**

command and control warfare—The integrated use of operations security (OPSEC), military deception, psychological operations (PSYOP), electronic warfare (EW), and physical destruction, mutually supported by intelligence, to deny information to, influence, degrade, or destroy adversary command and control capabilities, while protecting friendly command and control capabilities against such actions. Command and control warfare applies across the operational continuum and all levels of conflict. Also called C2W. C2W is both offensive and defensive:

C2-protection—To maintain effective command and control of own forces by turning to friendly advantage or negating adversary efforts to deny information to, influence, degrade, or destroy the friendly C2 system.

civil affairs—the activities of a commander that establish, maintain, influence, or exploit relations between military forces and civil authorities, both governmental and nongovernmental, and the civilian populace in a friendly, neutral, or hostile area of operations in order to facilitate military operations and consolidate operational objectives. Civil affairs activities (1) embrace the relationship between military forces and civil authorities and population in areas where military forces are present; and (2) involve application of civil affairs functional specialty skills, in areas normally the responsibility of civilian government, which enhance conduct of civil-military operations. These activities may occur prior to, during, or subsequent to other military actions. They may also occur, if directed, in the absence of other military operations.

combined operation—an operation conducted by forces of two or more allied nations acting together for the accomplishment of a single mission.

command information—see **internal information**

community relations—establishing and maintaining effective relationships between military and civilian communities through planning and active participation in events and processes which provide benefits to both communities.

community relations program—that command function which evaluates public attitudes, identifies the mission of a military organization with the public interest, and executes a program of action to earn public understanding and acceptance. Community relations programs are conducted at all levels of command, both in the United States and overseas, by military organizations having a community relations area of responsibility. Community relations programs include, but are not limited to, such activities as liaison and cooperation with associations and organizations and their local affiliates at all levels; armed forces participation in international, national, regional, state, and local public events; installation open houses and tours; embarkation in naval ships; orientation tours for distinguished civilians; people-to-people and humanitarian acts; cooperation with government officials and community leaders; and encouragement of armed forces personnel and their dependents to participate in activities of local schools, churches, fraternal, social, and civic organizations, sports, and recreation programs, and other aspects of community life to the extent feasible and appropriate, regardless of where they are located.

GIE—global information environment

global information environment—all individuals, organizations, or systems, most of which are outside the control of the military or National Command Authorities, that collect, process, and disseminate information to national and international audiences.

ground rules—conditions established by a military command to govern the conduct of news gathering and the release and/or use of specified information during an operation or during a specific period of time.

information age—the future time period when social, cultural, and economic patterns will reflect the decentralized, nonhierarchical flow of information.

information architecture—Description and specifications of information systems to include identification of communicators, information transmitted, equipment specifications and network designs. Includes operational, system and technical architectures.

information operations—continuous military operations within the military information environment that enable, enhance, and protect the friendly force's ability to collect, process, and act on information to achieve an advantage across the full range of military operations; information operations include interacting with the global information environment and exploiting or denying an adversary's information and decision capabilities.

information strategy—a synchronized plan for using all available and appropriate methods of communication to achieve specific goals of informing target audiences.

internal information—communication by a military organization with service members, civilian employees and family members of the organization that creates an awareness of the organization's goals, informs them of significant developments affecting them and the organization, increases their effectiveness as ambassadors of the organization, and satisfies their desire to be kept informed about what is going on in the organization and operation (also known as command information).

JIB—joint information bureau

joint information bureau—facilities established by the joint force commander to serve as the focal point for the interface between the military and the media during the conduct of joint operations. When operated in support of multinational operations, a joint information bureau is called a Combined Information Bureau or an Allied Press Information Center.

joint force—a general term applied to a force composed of significant elements, assigned or attached, of two or more Military Departments, operating under a single joint force commander.

joint operations—a general term to describe military actions conducted by joint forces, or by Service forces in relationships (e.g., support, coordinating authority), which, of themselves, do not create joint forces.

JOPES—Joint Operations Planning and Execution System

joint task force—a joint force that is constituted and so designated by the Secretary of Defense, a combatant commander, a subunified commander, or an existing joint task force commander. Also called JTF.

media facilitation—the range of activities such as providing access and interviews that assist news media representatives covering military operations.

media operations center—facility that serves as the focal point for the interface between the military and the media covering an event or operation.

media pool—a limited number of news media who represent a larger number of news media organizations for news gathering and sharing of material during a specified activity. Pooling is typically used when news media support resources cannot accommodate a large number of journalists. The DoD National Media Pool is available for coverage of the earliest stages of a contingency. Additionally, the combatant commanders may also find it necessary to form limited local pools to report on specific missions.

METT-TC—mission, enemy, terrain, troops, time available and civilians

MIE—military information environment

military information environment—the environment contained within the global information environment, consisting of the information systems and organizations—friendly and adversary, military and nonmilitary—that support, enable, or significantly influence a specific military operation.

MPAD--Mobile Public Affairs Detachment

multinational operations—a collective term to describe military actions conducted by forces of two or more nations, typically organized within the structure of a coalition or alliance.

news media representative—an individual employed by a civilian radio or television station, newspaper, newsmagazine, periodical, or news agency to gather information and report on a newsworthy event.

NGO—nongovernmental organization

nongovernmental organizations—transnational organizations of private citizens that maintain a consultative status with the Economic and Social Council of the United Nations. Nongovernmental organizations may be professional associations, foundations, multinational businesses, or simply groups with a common interest in humanitarian assistance activities (development and relief). “Nongovernmental organizations” is a term normally used by non-United States organizations. Also called NGO. See also private voluntary organizations.

PAD—Public Affairs Detachment. The smallest of the PA units.

PAG—public affairs guidance

PAOC—Public Affairs Operations Center.

private voluntary organizations—private, nonprofit humanitarian assistance organizations involved in development and relief activities. Private voluntary organizations are normally United States-based. “Private voluntary organization” is often used synonymously with the term “nongovernmental organization.” Also called PVO. See also nongovernmental organizations.

psychological operations—operations to convey selected information and indicators to foreign audiences to influence their emotions, motives, objective reasoning, and ultimately the behavior of foreign governments, organizations, groups, and individuals. The purpose of psychological operations is to induce or reinforce foreign attitudes and behavior favorable to the originator’s objectives. Also called PSYOP.

PSYOP—psychological operations

public affairs assessment—an analysis of the news media and public environments to evaluate the degree of understanding about strategic and operations objectives and military activities and to identify levels of public support. Includes judgments about the public affairs impact of pending decisions and recommendations about the structure of public affairs support for the assigned mission.

public affairs estimate—as assessment of a specific mission from a public affairs perspective.

public affairs guidance—normally, a package of information to support the public discussion of defense issues and operations. Such guidance can range from a telephonic response to a specific question to a more comprehensive package. Included

could be an approved public affairs policy, news statements, answers to anticipated media questions, and community relations guidance. Public affairs guidance also addresses the method(s), timing, location and other details governing the release of information to the public.

public information—A general term describing processes used to provide information to external audiences through public media.

sustaining base—the home station or permanent location of active duty units and Reserve Component units (e.g., location of armory or reserve center) that provides personnel, logistic and other support required to maintain and prolong operations or combat.

Preface

FM 3-61 provides guidance on communication strategy and public affairs operations. The Army defines the Public Affairs Program as the guide to conducting public communication strategy for information, command information, leader engagements, and community outreach activities directed toward both the external and internal publics with interest in the Department of Defense.

The principal audience for FM 3-61 is all members of the profession of arms. Commanders and staffs of Army headquarters serving as joint task force or multinational headquarters should also refer to applicable joint or multinational doctrine concerning the range of military operations and joint or multinational forces. Trainers and educators throughout the Army will also use this publication.

Commanders, staffs, and subordinates ensure that their decisions and actions comply with applicable United States, international, and in some cases host-nation laws and regulations. Commanders at all levels ensure that their Soldiers operate in accordance with the law of war and the rules of engagement. (See FM 6-27/MCTP 11-10C.)

FM 3-61 uses joint terms where applicable. Selected joint and Army terms and definitions appear in both the glossary and the text. Terms for which FM 3-61 is the proponent publication (the authority) are marked with an asterisk (*) in the glossary. When first defined in the text, terms for which FM 3-61 is the proponent publication are boldfaced and italicized, and the definitions are boldfaced. When first defining other proponent definitions in the text, the term is italicized and the number of the proponent publication follows the definition. Following uses of the term are not italicized.

FM 3-61 applies to the Active Army, Army National Guard/Army National Guard of the United States and United States Army Reserve unless otherwise stated.

The proponent of FM 3-61 is the Office of the Chief of Public Affairs. The preparing agency is the Army Public Affairs Center, Office of the Chief of Public Affairs. Send comments and recommendations on DA Form 2028 (*Recommended Changes to Publications and Blank Forms*) to Director, Army Public Affairs Center, SAPA-PAC, 4500 Parade Field Lane, Fort Meade, MD 20755-5650; or by email to usarmy.meade.hqda-ocpa.mesg.apac-policy-and-doctrine-division@mail.mil or submit an electronic DA Form 2028.

Introduction

Army public affairs doctrine is consistent and compatible with joint public affairs doctrine and policy as well as Department of Defense and Department of the Army public affairs policies. It describes the fundamental principles and concepts that provide information to internal and external international and national key actors who have a vest interest and involvement, audiences, and publics.

This publication includes public affairs functions, core tasks, tenets, and characteristics for commanders, planners, and other users of Army public affairs. Public affairs professionals use this manual to plan and execute public affairs strategy, planning, operations, and training.

This publication is based on current force structure and materiel capabilities. It is authoritative but not prescriptive. Public affairs professionals apply their professional knowledge, skills, and judgement when recommending command transformations to the principles in this publication to meet specific situations.

This updated version of FM 3-61 adds discussion of communications strategy within public affairs operations, fully coinciding with the 2020 update of AR 360-1. Revisions were designed with commanders in mind, as the first three chapters are now dedicated to the commander's public affairs program, responsibilities, and communication synchronization. The merge between public affairs and visual information led to the change to include visual activities and planning. In addition, this version incorporated more inclusivity, in alignment with Department of Defense and joint policy and guidance.

FM 3-61 contains 9 chapters:

Chapter 1 provides an overview of communication strategy from the commander's perspective. It first explains commander's communication strategy, outlines the public affairs mission and explains the public affairs mandate under Title 10, United States Code. Chapter 1 details how public affairs activities, core tasks and tenets, and characteristics support the commander and aid mission accomplishment. Lastly, the chapter describes how a communication strategy is integrated into operations through mission command, the operational framework, synchronization, and visual information.

Chapter 2 details methods used by public affairs personnel to advise the commander on the development and execution of an effective communications strategy. The chapter then explains the importance of the commander's guidance to public affairs in developing the commander's communication strategy and establishing the priorities for public affairs operations. Next, the chapter stresses the importance of the commander granting timely access to the public affairs officer. Finally, it describes the relevance of time to public affairs operations in achieving the desired effects.

Chapter 3 addresses the Army public affairs staff and its organization to support commanders and their communication strategies at all levels of command. It describes the roles and responsibilities of various public affairs personnel, including commissioned officers, noncommissioned officers, Soldiers, and Army Civilians, in providing public affairs support to Army operations. The chapter also details the various public affairs organizations and which echelon they are tailored to support.

Chapter 4 examines the relationship between public affairs training and an effective communication strategy. It outlines individual and collective training requirements for public affairs Soldiers and units. The chapter also emphasizes the importance of conducting public affairs training for non-public affairs units and highlights the roles, responsibilities, and methods that public affairs leaders and Soldiers use to provide this training.

Chapter 5 describes how public affairs planning is integrated within the operations process. Planning is an activity of command and control and involves effective use of the military decision-making process. Public affairs planning occurs during all activities of the operations process. The public affairs officer is responsible for producing the public affairs estimate, proposed public affairs guidance, and Annex J (Public Affairs). This chapter introduces the commander's communication synchronization process as a method for

coordinating and synchronizing public affairs activities during operations. Information on how Army public affairs develops and implements a crisis communication strategy and the essential components and process of developing a communication plan are also presented in this chapter.

Chapter 6 provides information on media facilitation. Public affairs provides the capability to assist civilian news media representatives at home station and in a deployed environment. The objective of media facilitation is to support news media agencies' efforts in covering operations to tell the Army's story.

Chapter 7 defines the role of public affairs in managing an organization's communication to various audiences. It examines the concept of segmentation and describes public communication from the perspective of audiences, stakeholders, and key publics. Additionally, this chapter covers basic principles of command information, community engagement, and communication synchronization, while introducing various supporting products. Finally, this chapter concludes with an examination of various regulations, laws, and policies that apply to the conduct of ethical and effective public affairs operations.

Chapter 8 describes the role of public affairs in countering misinformation and disinformation. It defines and describes misinformation and disinformation while emphasizing the importance of countering disinformation effects. This chapter explains disinformation tactics and offers methods for identifying misinformation and disinformation. The chapter emphasizes expedient release of information to counter disinformation and deter adversaries. Finally, the chapter outlines tactics for countering misinformation and disinformation in various media, including social media. It also describes the strategic narrative and how public affairs counters the adversarial narrative.

Chapter 9 defines the role of public affairs in digital media management and social media presence. It first defines digital media management, as it differs from social media maintenance. Additionally, this chapter covers the components of a digital media management strategy. It concludes with a definition of social media and the requirements for establishing a social media presence.

This publication contains seven appendixes. Appendix A details the format and content for public affairs running estimates. Proposed public affairs guidance is discussed in appendix B. Appendix C illustrates and explains the details in Annex J (Public Affairs) to the base order or plan. The communication plan is covered in appendix D. Appendix E gives an overview of media facilitation products. Appendix F details a message map and ways to use it to interact with the media. The final appendix covers public affairs professional development.

The introductory table-1 outlines changes to Army terminology reflected in FM 3-61.

Introductory table-1. New and modified Army terms

<i>Term</i>	<i>Remarks</i>
disinformation	New term and definition.
media representatives	New term and definition.
misinformation	New term and definition.
official information	New term and definition.

PART ONE

Communication Strategy

Part One of this manual is for commanders. Commanders play a critical role in the Army communication strategy. The Army must continue to maintain the trust and confidence of the American people while using information to deter competitors and defeat adversaries. Commanders employ their qualified public affairs personnel, staff, and unit personnel through all phases of the operations process to achieve communication objectives. Communication objectives nest with the Army communication plan. Part One explains which parts of public affairs directly relate to commanders and the role that they play in the public affairs process. Part One provides commanders with the Army's public affairs and visual information structure and organization to give commanders a better understanding of their responsibilities for public affairs and visual information.

Chapter 1

Communication Strategy Overview

COMMUNICATION STRATEGY

1-1. The commander's communication strategy, also known as commander's intent for public affairs, is the communication process and activities for public information, command information, crisis communication, visual information, communication synchronization, and community engagement directed toward external and internal audiences with interest in the Department of Defense (DOD). In public affairs, a *public* is a segment of the population with common attributes to which a military force can tailor its communication (JP 3-61). By implementing the DOD principles of information, Army public affairs (PA) operations help to establish conditions that lead to trust and confidence in the Army and its readiness to conduct multi-domain operations, deter competitors, and defeat adversaries. Commanders conduct PA operations while deployed and at home station in support of those objectives. To ensure synchronization with Department of the Army (DA) and DOD communication efforts, commanders align and nest PA operations with PA guidance from the Office of the Secretary of the Army as distributed through the Chief of Public Affairs. (See DODD 5122.05 for the DOD principles of information.)

COMMUNICATION SYNCHRONIZATION

1-2. Modern technology provides commanders with a greater ability to shape and affect the information environment by implementing their PA and visual information capabilities. The commander's communication synchronization, formerly known as strategic communications or STRATCOM, helps commanders operate in the information environment. *Commander's communication synchronization* is a process to coordinate and synchronize narratives, themes, messages, images, operations, and actions to ensure their integrity and consistency to the lowest tactical level across all relevant communication activities (JP 3-61). Commanders' communication influence internal and external audiences, as communication links information to decisions and decisions to actions. In public affairs, an *audience* is a broadly defined group

that contains stakeholders and/or publics relevant to military operations (JP 3-61). Information imparts structure and shape to military operations for internal and external audiences alike.

1-3. Commanders formulate and communicate their intent to their Soldiers, subordinates, and various audiences to describe the boundaries in which they may exercise initiative while maintaining unity of effort. The qualified public affairs officer (PAO) is the commander's principal advisor and counselor for public information, command information, crisis communications, visual information, communication synchronization, and community engagement. As a skilled communicator and member of the commander's personal staff, the PAO remains closely and continuously involved in all operational phases.

1-4. The PAO normally leads the commander's communication synchronization (CCS) and coordinates themes, messages, narratives, talking points, images, operations, and actions. The PAO implements higher-level communication guidance to the lowest tactical level across all relevant communication activities. The PAO supports the development and execution of the commander's communication lines of effort and objectives. These communication objectives guide the CCS, and conversely, the CCS ensures that the commander's communication objectives nest and align with the broader DOD strategic narrative. (See paragraph 1-20 for more on CCS.)

PUBLIC AFFAIRS AND THE COMMANDER'S INFORMATION ENVIRONMENT

1-5. JP 3-61 defines *public affairs* as communication activities with external and internal audiences. PA is a primary capability supporting the commander's operations in the information environment. Through this capability, the commander provides information to global and domestic audiences in efforts to accurately describe operations or provide information to affected publics in the area of operations. PA provides these audiences with facts explaining why the Army does certain things and conducts specific operations to create a shared understanding and to help those audiences make decisions. Providing credible, accurate, and timely information serves as the best means to counter misinformation, disinformation, and propaganda, which can lead to deterred competitors and defeated adversaries. Maintaining trust, transparency, and credibility is critical when providing public information. Soldiers must never compromise this.

1-6. All information dissemination, regardless of the communicator or medium, is intended to either inform or influence. The intent of the communication guides the commander's decision to either inform or influence the public to achieve the desired end state. Commanders must use PA with various groups providing accurate information within authorities, laws, regulations, and operations security guidelines. Commanders are required to have a public affairs program that includes communication with internal and external audiences.

COMMANDER'S SUPPORT TO THE PUBLIC AFFAIRS MISSION

1-7. Commanders will support their PA teams and staffs when executing the PA mission. The Army PA mission is to fulfill the obligation to keep the American people informed. It helps to establish the conditions maintaining confidence in America's Army and its readiness to conduct operations across the range of military operations. This obligation is established in Title 10, United States Code (USC).

1-8. Implicit in a democratic republic is the right of citizens to know the activities of their elected government. The government, in return, has an obligation to inform its citizens of its activities. This right also applies to the activities of the military as it is established by the Constitution to provide for the common defense and general welfare of the United States.

1-9. One of the most significant conduits through which information is passed to our citizens is the free press guaranteed by the Constitution. Since the nation's founding, the Army has communicated information to the American people through the media in both traditional and emergent platforms.

1-10. Commanders use the science of control—which includes information and communication as part of the commander's command and control system—to conduct operations successfully. When properly employed, PA assists in meeting the commander's communication intent. PA enables the commander to establish and maintain the trust and confidence between the Army and the American people that is essential to the legitimacy and support of the Army as a profession. All stakeholders are affected—whether negatively

or positively—by the flow of information. Army PA contributes to ethical behaviors, respect for laws of war, and the rights of noncombatants.

PUBLIC AFFAIRS MANDATE

1-11. The Secretary of the Army is required to designate a single career field to conduct PA. Commanders, through their PA operations and the communication strategy, are responsible for informing the American people of the Army's mission and goals as well as communicating to the public what the Army does. Informing the American people assists the Army in establishing conditions that lead to the public's understanding and support. Effective PA generates and enables the sustainment of Army credibility with international, national, and local publics, while deterring competitors and defeating adversaries.

1-12. PA is a commander responsibility. PA doctrine and principles of information apply across the range of military operations. At each level of command, PAOs report directly to the commander. Commanders at all levels ensure that PA coordinate and de-conflict planning with other information-related capabilities (IRCs) through command working groups, planning groups, and the CCS.

1-13. Commanders are authorized to designate only DOD-qualified personnel as official spokespersons. Commanders educate and encourage all their Soldiers and DA Civilians to provide timely information appropriate for public release to tell the Army story. By projecting confidence and commitment during engagements and other interactions with families and friends, Army personnel promote public understanding of military operations and activities. (See AR 360-1 for PA spokespersons.)

THE PUBLIC AFFAIRS MISSION

1-14. The structure of the public affairs mission visibly resembles the Parthenon. The overarching public affairs mission consists of the activities, the tasks, and the tenets (see figure 1-1 on page 1-4). PA activities are the guiding functions of the PA mission, which directly enable the commander's efforts to inform and educate audiences in the operational environment. Commanders use PA activities to achieve their communication strategies.

1-15. The tenets form the base of PA mission and represent the best practices or actions by PA staff. The tenets support the core tasks. PA professionals conduct the core tasks in support of the commander's communication strategy to complete the public affairs mission.

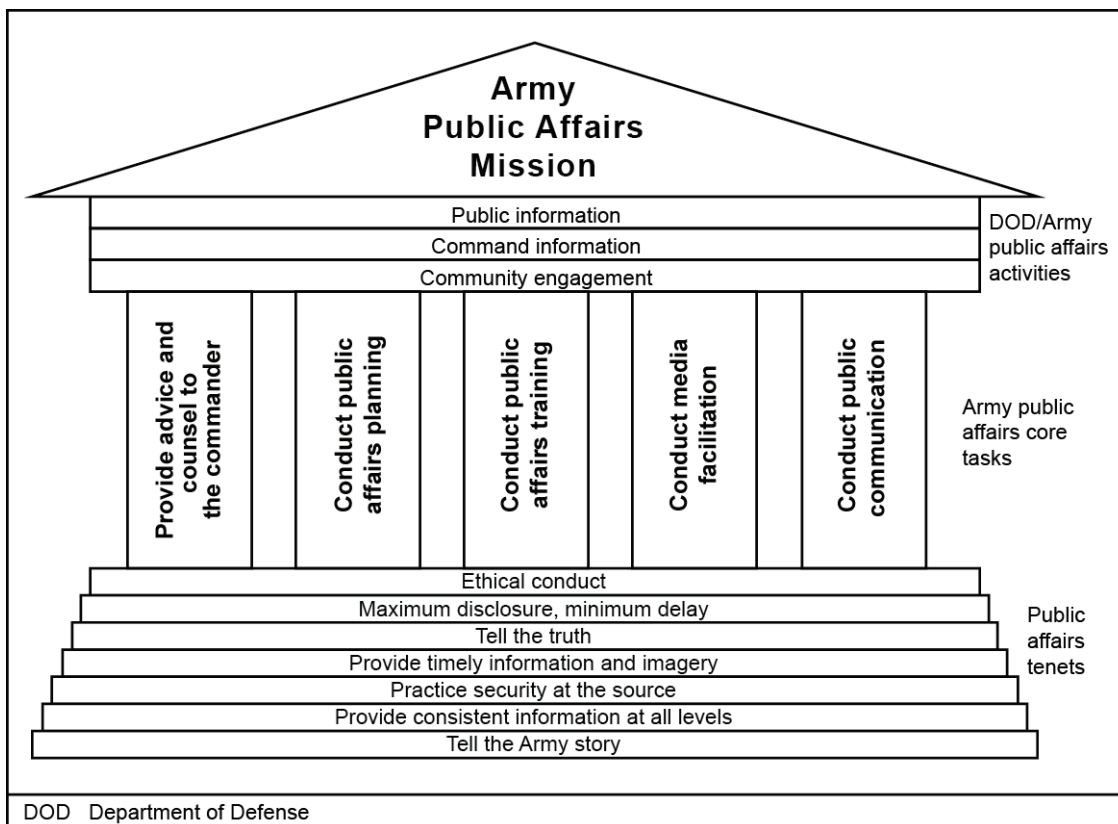

Figure 1-1. Army public affairs structure

PUBLIC AFFAIRS ACTIVITIES

1-16. PA activities support the commander's communication strategy. There are five PA activities: public information, command information, CCS, community engagement, and visual information. Planning and assessment throughout the course of operations support the activities. With today's technological advancements, some PA activities may converge or overlap as information becomes instantly available throughout the information environment. Army PA core tasks and tenets—with communication characteristics—support the five activities. Commanders ensure PA professionals have access to manpower, resources, technology, public networks, and professional equipment to facilitate PA activities.

1-17. PA requirements and actions are inherent in all military activities and are key enablers for managing and delivering information through public communication. Army public information dissemination is consistent with security and DOD principles of information. (See JP 3-61 for the formal definition of public information; see paragraph 2-9 and DODD 5122.05 for the principles of information.) Information technology advances provide new public information opportunities. In addition to the deliberate use of these technologies, commanders must include media engagement activities in fully developed communication plans. Media facilitation activities provide information to international and domestic publics. Commanders and their PA staffs should conduct briefings and interviews, issue statements, respond to queries, arrange for access to operational units, maintain digital communication tools and platforms, and provide appropriate equipment, transportation, and communications support to the media. (See paragraph 1-34 for more on media facilitation. See appendix G for media facilitation products.)

Command Information

1-18. Command information is communication from the commander to help members of the command understand organizational goals, operations, and significant developments. (See JP 3-61 for a discussion of command information.) Although installation and organizational publications provide traditional ways of

communicating with the command, other forms of communication—including digital media platforms—provide quicker and more efficient means of communication. PA professionals understand digital media operations and methods to communicate quickly and effectively with local publics, such as using social media in announcing weather hazards, gate closures, or traffic issues. During a military operation, commanders consider all available dissemination capabilities to communicate releasable details and the role of the military in the operation.

1-19. Commander's intent drives public affairs activities. Command information reflects commander's intent. Command information is an excellent venue to incorporate and reinforce the five essential characteristics of the Army Profession (trust, military expertise, honorable service, *esprit de corps*, and stewardship), the Army Ethics, and the three-certification criteria of Army professionals: competence, character, and commitment. While command information is intended to communicate internally, commanders must recognize that in today's information environment, once information is released, it becomes readily available to all publics.

Commander's Communication Synchronization

1-20. CCS synchronizes communications and information across all echelons to ensure unity of effort and to reduce and eliminate information fratricide. Failing to synchronize communications across echelons results in conflicting messages, reduces credibility, and directly impacts communication effectiveness. It also allows the adversary to undermine the commander's credibility and narrative and, ultimately, the broader DOD strategic narrative. CCS stresses the importance of the human dimension and the effect that the commander's communication objectives have throughout an operational environment.

1-21. CCS is driven by the commander's operations in an operational environment. During operations, CCS provides operational planners insight on foreign audience perception of the operations. This insight helps build a better understanding that should help guide and synchronize operations with supporting words and images that further the commander's objectives. As the primary coordinator of public information within the military, PA plays a key role in—and often leads—CCS to maximize alignment of all communication efforts held by other IRCs. CCS is integral in ensuring that the commander's communication objectives align with the broader DOD strategic narrative. (For more on CCS, see AR 360-1, JP 3-61, and JDN 2-13.)

Community Engagement

1-22. Community engagement encompasses all Army community relations activities regardless of name, activity, or sponsorship. This includes community engagements associated with recruiting, Soldier and leader engagement, or any other terms adopted for the purposes of face-to-face interaction with civilian publics (see DODI 5410.19 and JP 3-61 for community engagement). Army community engagement is a PA activity that supports the relationship between military and civilian communities. PA personnel work collaboratively with groups of people affiliated by geographic proximity or a special interest to enhance the understanding of and support for the Army, its operations, and its activities. All community engagement activities should support the commander's communication objectives. PA assists in identifying key leaders and recommending opportunities for military engagement. Military leaders at echelon have a responsibility to engage key community leaders, including those from other government agencies and nongovernmental organizations (NGOs). (See paragraph 7-31 for more on community engagement.)

Visual Information

1-23. Visual information is visual media with or without sound and is a visual subset of military information used to support communication synchronization, command information, community engagement, public diplomacy, operational planning, decision making, and training. (See JP 3-61 for a formal definition of visual information.) Visual information (VI) enhances information activities with visual context that supports PA themes and messages. VI comes from two sources: directed sources, such as PA activities and combat camera (COMCAM), and derivative sources including manned, unmanned, and remotely piloted platforms that collect imagery.

1-24. Regardless of the mission and conditions under which VI is created, it becomes an official record and may be releasable under the Freedom of Information Act (FOIA), as a request for evidence in litigation cases,

or under other sources of legal authority. In accordance with the *DOD Captioning Style Guide*, all producers, editors and users of VI select, label, and retain VI with complete captions and metadata to describe the content accurately. Users can obtain information about, and access to, imagery from or through central DOD VI information systems. Army PA professionals establish and operate such information systems in compliance with DODI 8320.02. One system is CORE, the Army's official content management system. Central DOD VI information systems provide tools to build a digital presence for organizations and the Defense Visual Information Distribution System (DVIDS), which provides a connection between world media and Service members serving at home.

PUBLIC AFFAIRS CORE TASKS

1-25. The Army Universal Task List (known as AUTL) outlines the Army PA core tasks. Core tasks are key activities PA personnel perform to ensure mission success. PA core tasks make the PA section or unit essential for commanders, staffs, media representatives, and publics. The core tasks, as outlined in the Army Universal Task list, are:

- Provide advice and counsel to the commander.
- Conduct PA and VI planning.
- Conduct PA training.
- Conduct media facilitation.
- Conduct public communication.
- Counter misinformation and disinformation.
- Conduct communications assessments.

Provide Advice and Counsel to the Commander

1-26. The PAO is the commander's senior advisor on communication strategy and PA activities. The PAO establishes and sustains commander and staff relationships and maintains direct and timely access to the commander. The more the PAO understands the operational environment, the more valuable the advice and counsel and the more developed the communication strategy.

1-27. PAOs ensure commanders understand implications of their decisions as well as the strength of public perception. Commanders understand the implications of their actions and decisions on PA. With the evolution of the global information environment, PA activities have become an increasingly critical element in determining the success of support to strategic end states. Commanders recognize the strength and influence of public opinion and perception on the morale, confidence, and effectiveness of Soldiers' abilities to achieve mission success.

1-28. PA professionals assist the commander in providing complete, accurate, and timely information to the public while developing the commander's communication strategy and the plans that achieve that strategy. All information must abide by the constraints of operations security (OPSEC). Providing timely information within such constraints enables the commander to achieve a balanced, fair, and credible information exchange and relationship with the public while deterring competitors and defeating adversaries.

1-29. PA professionals assist the commander in understanding the information needs and expectations of Soldiers, Family members, the home station community, and all other affected publics. Commanders consider these expectations when developing their communication strategies. PA professionals also tailor communication plans to meet the information needs and expectations of the affected publics both foreign and domestic.

Conduct Public Affairs and Visual Information Planning

1-30. PA section or unit conducts PA and VI planning. Communication strategy takes continuous, collaborative planning. Developing a synchronized, cohesive, and comprehensive PA and VI plan is vital in meeting the commander's communication objective requirements. The PA and VI section or unit must articulate and synchronize PA and VI planning within the military decision-making process (MDMP), to include incorporating COMCAM assets where necessary. Commanders incorporate the communication strategy and objectives in the initial plan. The PA section or unit provides detailed analysis of PA activities

beyond article counts and positive, neutral, and negative evaluations. PA professionals also plan for and incorporate traditional, nontraditional, and digital media platforms into the PA plan, analysis, and assessment. (For more on planning, see the discussion beginning in paragraph 5-1.)

Conduct Public Affairs Training

1-31. PA professionals conduct PA training. PA and VI qualification training occurs through the Defense Information School as a joint Service program. PA leaders and Soldiers are trained to follow the operations process of plan, prepare, execute, and assess in unit training and leader development by using unit training management as discussed in ADP 7-0. PA professionals participate in and use the MDMP to plan PA training. (See Appendix H for more of leader and unit development.)

1-32. The training may be group media familiarization, one-on-one interview techniques with subject matter experts, and appropriate use of digital media that can impact the information environment and strategic level actions. Such training applies to all Soldiers within the command. PA professionals must be prepared to train and assist unified action partners. Effective training replicates operational realities and teaches the fundamentals of media and military interactions. Such training emphasizes that the media is a communication channel to internal and external audiences and not an adversary. OPSEC must be a consideration for all PA training.

1-33. Commanders are responsible for establishing a unit public affairs representatives (UPARs) training program in their commands. (Refer to AR 360-1 for UPAR.) Commanders provide Soldiers who have been officially designated and placed on additional duty orders the requisite training in PA. (For more on UPAR training, see paragraph 4-33.)

Conduct Media Facilitation

1-34. PA staff conduct media facilitation. Media facilitation involves planning, preparing, executing, and assessing a media engagement. A media engagement is a specified instance of media interaction between a spokesperson and a member or members of the media. Media interactions occur when the media interacts with Soldiers, often on the battlefield, without PA presence.

1-35. The meaning of the word media has evolved from radio, televised, and print mass communication and now includes information technology and social media. PA staff also evolve media facilitation to support digital media platforms needs and increased nontraditional media interest in Army activities. Facilitation must include traditional, nontraditional, and digital media. PA personnel require access to information and operations centers, along with adequate media facilitation facilities, to assist the media in reporting the Army story properly.

1-36. Media facilitation includes the support of embedded media. Media embeds can be included into a command over an extended period. Commanders ensure that media embeds are credentialed and that they are provided a set of ground rules. (For more on media embeds, see discussion beginning in paragraph 6-45.)

Conduct Public Communication

1-37. PA professionals conduct public communication in all military activities. Through public communication, PA personnel manage and deliver public information. Public communication is communication through coordinated programs, plans, themes, and messages among the Army and international, national, and local publics, as well as competitors and adversaries. It involves the receipt and exchange of ideas and opinions that contribute to shaping public understanding of, and discourse with, the Army. (See Chapter 7 for a discussion of public communication.)

Counter Misinformation and Disinformation

1-38. PA professionals counter misinformation and disinformation. **Misinformation is a subset of information that includes all incorrect information. Disinformation is the deliberate use of incorrect or false information with the intention to deceive or mislead.** Army PA enables commanders to preempt, identify, and counter adversary attempts at malign narrative. PA distribute legitimate, timely, and truthful

information regarding Army operations, equipment, and personnel across multiple platforms within OPSEC constraints.

1-39. Commanders play a critical and strategic role in countering misinformation and disinformation. Misinformation, disinformation, or a combination of both is not an adversary but a tactic used by adversaries. Adversaries use information as propaganda to minimize the effect of military operations and programs. To combat this use, commanders must understand that the release of timely and accurate information is paramount. While conducting this task along with conducting communication assessments, PA personnel can identify the adversarial narrative. With an identified narrative, the commander can shape the communication objectives to counter the narrative through timely and accurate information.

Conduct Communications Assessments

1-40. Commanders and staff conduct communications assessments. Communications assessments follow the general assessments process discussed broadly in ADP 5-0 and in detail in FM 6-0. ADP 5-0 provides overarching guidance on assessment. However, commanders have unique considerations for PA assessment. Proper PA assessments may require additional resources not readily available within the command. Additionally, commanders must examine legal authorities when considering aspects of assessing an operational environment as it relates to use of capabilities not typically available within the PA staff.

1-41. Commanders and staff conduct communications assessments throughout an operation and measure whether the unit achieved communication objectives as planned. These assessments inform the commander's decision on whether or not to change course. Commanders and staff continuously assess an operational environment and the progress of the commander's objectives within it. The PAO and other staff representatives monitor the operational environment, which influences the outcome of operations and then provide the commander timely information needed for decisions. Planning for the assessment identifies key aspects of the operation in which the commander is interested in closely monitoring and where the commander wants to make decisions. The assessment identifies and evaluates the information environment relevant to the commander's intent, mission, area of operations, and echelon of unit. It includes an examination of the physical and social infrastructure from a PA perspective. (For more information on assessments, see paragraph 5-64.)

PUBLIC AFFAIRS TENETS

1-42. Effective application of the PA tenets follows the DOD principles of information and can result in more effective and efficient communication activities, improved relationships with the media, successful countering of misinformation and disinformation, deterrence of competitors, and defeat of adversaries. The tenets describe best practices. Successful PA personnel review and appropriately apply these tenets during all stages of PA activities, PA core tasks, and the operations process. (See DODD 5122.05 for the principles of information.)

Practice Ethical Conduct

1-43. The practice of PA centers on truth, trust, and credibility. To be effective in a profession that relies heavily on institutional and individual credibility, effective PA professionals require a solid ethical foundation. The Army Profession is built on trust, and PA professionals are charged with establishing conditions that lead to trust and confidence in America's Army in peace and war.

1-44. Lapses of ethical judgment often become controversial media topics, garner negative publicity, and significantly damage reputations and credibility. As a result, these lapses potentially result in the loss of trust. Adversaries may exploit and magnify any loss of discipline by Soldiers through propaganda and the media. Such negative publicity damages the Army's reputation; adhering to the tenets of PA can minimize the effects of negative publicity and maintain public trust and confidence in the Army.

1-45. PA professionals communicate to internal and external audiences the importance of careful and responsible management of the Army Profession. These professionals communicate with their actions by adhering to the highest standards of military ethics and morality. This stewardship helps solidify the trust among the American people, host nations, and the Army.

1-46. To maintain credibility, PA professionals abide by journalistic ethics and can identify when media representatives fail to adhere to fair and balanced reporting. Although PA professionals cannot control the media, PA professionals must be accurate and accountable. They treat all media representatives with respect, integrity, and equal consideration to maintain credibility.

Provide Maximum Disclosure, Minimum Delay

1-47. The Army has an obligation to keep its publics informed in a thorough and timely manner. Open and independent reporting is the norm. Commanders grant media representatives access to units, activities, and operations within the bounds of OPSEC. **Media representatives are individuals representing civilian radio or television station, newspaper, magazine, periodical, independent blog, or news agency to gather and report on a newsworthy event.** Commanders delegate authority to PAOs to release information to the public as stipulated in AR 360-1. PAOs avoid withholding or delaying the release of information solely to protect the installation, command, or the Army from criticism or embarrassment. Being open and forthcoming enhances the Army's credibility and trustworthiness.

Tell the Truth

1-48. PA professionals release only accurate information in a timely manner. The long-term success of a commander's communication strategy through PA activities depends on maintaining the integrity and credibility of officially released information. Deceiving the public undermines trust in the Army. Accurate, balanced, and credible presentation of information leads to public confidence in the Army and the legitimacy of Army operations. Attempting to deny unfavorable information or failing to acknowledge its existence leads to media speculation, the perception of a cover-up, and the loss of public trust. Commanders, along with their PAOs, should address issues openly and honestly as soon as possible.

Provide Timely and Accurate Public Affairs and Visual Information

1-49. Commanders remain prepared to release timely, factual, coordinated, and approved information and imagery. The public release of information and imagery has a powerful effect on friendly, neutral, adversary, and enemy decision-making cycles and perceptions. The source that releases more timely and accurate information and imagery often controls the information environment. As part of the commander's communication strategy, PAOs establish a timely and accurate process for the release of information.

Practice Security at the Source

1-50. All Army personnel must be aware of OPSEC and are responsible for safeguarding sensitive information. Therefore, it is critical that the appropriate PA section approve official information and imagery prior to public release. (Refer to AR 360-1 for public release of information.) **Official information is information that is owned by, produced for or by, or is subject to the control of the United States government.** OPSEC applies to media interviews and the sharing of information and imagery with families or friends to include email and digital media platforms. Commanders ensure PAOs and PA noncommissioned officers (NCOs) responsible for the release of information are OPSEC level II qualified. (See AR 360-1 for security of information.)

Provide Consistent Information at All Levels

1-51. The public often receives information simultaneously from multiple sources. The Army's and the commander's credibility are jeopardized if the information conflicts. PAOs need to appropriately coordinate information and imagery and ensure it complies with command guidance before releasing it to the public. The CCS supports consistent information at all levels.

Tell the Army Story

1-52. The commander's communication objectives—through the communication strategy—aim to tell the Army story accurately, honestly, and completely to as many publics as possible. The commander tells the story through a timely release of information to internal and external audiences and digital media platforms. The civilian media serve as a link between the Army and the American public. That link is critical as the

Army cannot carry out its mission without public support. Commanders recognize the legitimate role of news media and digital media platforms in reporting military operations and accept the presence of these platforms wherever the U.S. military operates.

COMMUNICATION CHARACTERISTICS

1-53. Communication characteristics are those qualities, behaviors, skills, abilities, and knowledge that directly and positively impact the success of PA and the Army communication strategy. PA leaders measure characteristics objectively and improve PA professionals through mentoring and training. Communication characteristics help PA professionals focus attention on key command goals, improved credibility and public understanding and support.

1-54. PA professionals must—

- Exercise a proactive approach to determine second- and third-order effects and develop plans to shape possible outcomes.
- Exercise disciplined initiative by adapting to operational conditions through flexible and agile creative thinking to solve problems.
- Comprehend the strategic vision by seeing the big picture and strategic implications of tactical events.
- Use sound judgement in recommending appropriate communication objectives to the commander.
- Create a collaborative understanding of the impact of PA activities on an operational environment, mission, and operations.
- Enhance relationships and communication through cultural awareness by understanding the cultural differences among military, U.S., international, competitor, and adversarial publics and knowing how PA activities impact each differently.
- Apply ethical reasoning to make informed choices and provide counsel to the commander when faced with tough issues and ethical concerns concerning the ramifications of an organization or leadership's actions.

PUBLIC AFFAIRS AND THE JOINT INFORMATION FUNCTION

1-55. PA operations are conducted, using proper authorities, as an information function. Synchronizing PA operations with military IRCs helps the commander shape the information environment. The *information environment* is the aggregate of individuals, organizations, and systems that collect, process, disseminate, or act on information (JP 3-13). The information environment consists of the physical, informational, and cognitive dimensions.

1-56. The complexity of the information environment creates many challenges for commanders. The global expanse of the information environment and technology enables news reports and analyses to inform public opinions and decisions concerning military operations rapidly. Information is constantly being gathered and disseminated as evidenced by the continuous news cycle as well as by digital media platforms with a seemingly unimportant post or update going viral. Geographic boundaries no longer limit information dissemination; therefore, information about an event in the United States can directly affect operations in a theater of operations halfway around the world and vice versa. Misinformation and disinformation can negatively affect U.S. operations and must be considered in the CCS.

1-57. PA professionals analyze information across traditional and digital media platforms to assess effectiveness of Army communication and to identify risks created by misinformation, disinformation, or both. Identifying misinformation and disinformation that places commander objectives at risk is a critical PA task within the information function. Public information about Army activities may have positive or negative effects in the information environment. Technological advances have made collection and dissemination of information available to broader and more diverse publics faster and on a larger scale. The American public, allies, competitors, and adversaries view military operations in real-time, which results in the increased analysis, critique, and editorial commentary by the media and publics.

PUBLIC AFFAIRS SUPPORT TO MULTI-DOMAIN OPERATIONS

1-58. Information requirements exist across all domains and during all operations. Army PA, as a unique IRC, supports the joint force in multi-domain operations by enabling commanders to identify, target, and respond to near-peer adversaries' efforts to fracture alliances, partnerships, and resolve. Multi-domain operations assert that near-peer adversaries—in a state of continuous competition with the United States, its allies and partners—seek to weaken resolve by exploiting conditions of an operational environment. An *operational environment* is a composite of the conditions, circumstances, and influences that affect the employment of capabilities and bear on the decisions of the commander (JP 3-0). Within the information environment, modern near-peer adversaries use misinformation and disinformation tactics in both the competition and armed conflict of multi-domain operations, and distribute the resulting false narratives through traditional and digital media platforms.

1-59. Information is the pervasive backdrop to an operational environment and is continuously changing. To help shape a conducive information environment, commanders use PA and design a communication strategy engaging key publics within an operational environment and throughout the competition and armed conflict of multi-domain operations. Army leaders plan, prepare, execute, and assess operations by analyzing an operational environment. Commanders and staff synchronize PA with the operations process.

1-60. In multi-domain operations, PA seeks to counter adversarial misinformation and disinformation by actively conducting and facilitating communication among the Army and international, national, and local publics through coordinated programs, plans, themes, and messages.

1-61. The perception of the Army and its conduct of operations is as important to the success of an operation as decisive action on the battlefield. Through proper planning, integration, synchronization, and coordination, Army units conduct PA operations to help address the five problems the Army confronts in multi-domain operations: compete, penetrate, disintegrate, exploit, and re-compete.

1-62. PA staff, when directed or required, coordinates and often leads using military IRCs and other staff components through CCS in support of multi-domain operations. Effective PA personnel thoroughly understand the essential characteristics of the Army Profession, the fundamentals of Army operations, and the strategic context within which the Army conducts multi-domain operations. PA leaders recognize the links tying public opinion, political decision-making, and the National Defense Strategy together as well as the Army's application of the multi-domain operations concept to fulfill its role to the Joint Force.

PUBLIC AFFAIRS AND INFORMATION OPERATIONS

1-63. PA and information operations (IO) both directly support military objectives, but their activities differ with respect to commander's intent, scope, and audience and are governed by separate procedures. PA is the principal capability for keeping the American public and Army informed and educated. IO is the integrated employment of IRCs in concert with other lines of operation to influence, disrupt, corrupt, or usurp the decision making of adversaries and potential adversaries while protecting our own. (See JP 3-13 for more on IO.)

1-64. Commanders, through non-PA information-related activities, communicate to select, non-American publics to change attitudes, beliefs, and behavior. In tactical and operational environments, and when appropriate, staff sections in the IO working group conduct synchronization and coordination of communication objectives. The working group conducts coordination in which PA and command-designated IRCs participate during tactical and operational missions; however, the capabilities retain their own distinct identities and staff organization.

1-65. PA Soldiers participate in the IO working group by continually assessing the information environment to determine the degree and nature of media coverage. They take steps to correct misinformation and propaganda. They also seek to leverage other military IRCs—such as COMCAM or civil affairs operations—to provide greater accuracy, context, and characterization to the information. Additionally, PA operations provide reinforcing messaging for other IRCs.

1-66. The commander designates IRC capabilities in the IO working group to shape an information environment. Mission requirements determine if a staff for each IRC operates independently or with other

IRCs staffs. Based on command guidance and assessments, the coordination through the working group allows for message alignment, reinforcement, and consistency in support of the commander's overall concept of operations. The commander resolves any differences in courses of actions developed in the IO working group.

1-67. The PA and commander's designated IRCs establish rapid processes robust enough to quickly understand, shape, engage, and assess information through dynamic engagements of opportunity as well as to make changes to the planned engagements or objectives. Engagements of opportunity could have been identified too late, or not selected for action in time to be included in deliberate engagements. Subjects engaged as part of dynamic engagements are previously unanticipated, unplanned, or newly detected. Examples range from crisis communication to command information response. Units develop a tiered information engagement model that supports deliberate and dynamic engagements through collaborative efforts. Units provide the appropriate authorities to each commander for each activity of an operation or engagement.

1-68. The PA and commander's designated IRCs establish a process that enables the commander and staff to plan for deliberate engagements based on planned missions and objectives. Deliberate engagements are known events for the unit. Examples range from command information engagements to community engagements.

1-69. The PA and commander synchronize the unit's IRCs and resources toward engaging the high pay-off engagement list and commander's priorities in information engagement. The high-payoff engagement list and command response matrix are created during the Army targeting methodology's decide function. They use this list and matrix during the rest of Army targeting methodology to provide the overall focus and set priorities for information engagement planning. The plan addresses priorities for each activity or critical event of an operation. Engagement selection standards (developed in the command response matrix) address accuracy or other specific criteria that units must meet before engagements can occur. The decisions made are reflected in visual products. The command response matrix, approved by the commander, addresses which, how, and when subjects will be engaged, and the desired effects. (See FM 3-13 for details on Army targeting methodology.)

PUBLIC AFFAIRS IN THE OPERATIONS STRUCTURE

1-70. Other IRCs—military information support operations (MISO), civil affairs, military deception operations—may communicate to deliberately influence, persuade, coerce, or spark compliance or thought reform. (See FM 3-53 and JDN 2-13 for more on IRCs.) Commanders who seek to use PA as an influencing instead of an informing capability risk the public's perception of participation in propaganda.

1-71. The operations structure—the operations process, combat power, and the operational framework—is the Army's common construct for unified land operations. PA personnel plan, coordinate, and synchronize activities during CCS as part of the operations process. (See chapter 5 for PA and the operations process.) PA activities help Army leaders communicate their visualization of operations in time, space, purpose, and resources.

1-72. Commanders and staff incorporate PA into every activity of operations. PA planners actively contribute to the operations process and Army design methodology. PA planning begins with the receipt of the mission. PA leads CCS, coordinating with other IRCs in an operational environment during the MDMP. PA provides the following products during CCS:

- Media analysis products.
- Media engagement plan.
- Higher headquarters communication plan.
- Incorporated themes and messages from higher headquarters.
- Command information plan.
- Key leader engagements and outreach activities.
- Public communication and digital media plan.

1-73. The result is the development of Annex J (Public Affairs) and the commander's communication strategy for inclusion into paragraph 3 of the operation order. The PA staff continually assesses the

information environment to determine the degree and nature of media coverage. (Chapter 5 discusses PA planning. See appendix D for more on Annex J [Public Affairs].)

PUBLIC AFFAIRS SUPPORT TO DEFENSE SUPPORT OF CIVIL AUTHORITIES

1-74. PA supports defense support of civil authorities (DSCA) through its PA assessment. DSCA operations are vital aspects of the military's service to the Nation. DSCA is support provided by Federal forces and assets for domestic emergencies, law enforcement support, and other domestic activities, or from qualifying entities for special events. (See DODD 3025.18 for details on DSCA.) A *public affairs assessment* is an analysis of the news media and public environments to evaluate the degree of understanding about strategic and operational objectives and military activities and to identify all levels of public support (JP 3-61). PA staff will monitor and assess public opinion, media coverage, and sentiment analysis.

1-75. Critical differences exist between operations conducted in DSCA and operations conducted outside the United States. Differences include the roles of civilian organizations; the relationship of military forces to federal, state, tribal, and local agencies; and the legal authorities under which military forces operate. Military forces train to understand the domestic environment so they can employ appropriate military capabilities efficiently, effectively, and legally.

1-76. State and local officials provide information and directions to the public (such as evacuation and shelter in place) during DSCA. Each state determines who has the authority to provide directions to the public (such as the sheriff, mayor, or judge). In no case does the Army take the initiative to provide directions to the public. Army agencies may assist the appropriate authorities with disseminating information as long as the instructions properly attribute the source. For example, "The mayor has directed a mandatory evacuation for the city" attributes the source of the information to the mayor.

1-77. Army PA personnel coordinate PA activities and comply with PA guidance from the media operations center (MOC) or, if one is not set up, the joint field office. Normally the incident PAO, press officer, public information officer, or MOC releases general information to the public and media. Supporting agencies may assist in the release of information but are limited to providing specific agency actions only. For the Army, this means PA activities are limited to supporting the primary agency or focusing on Army actions that support the incident (in coordination with the primary agency). In no case will Army PA activities place the Army in the forefront; the PAO portrays the Army as a partner and participant in the incident response.

1-78. The PAO ensures Soldiers are aware of the potential consequences associated with questionable on-camera behavior or speaking to the media without authorization. PAOs complete mandatory training posted on the Army Social Media website as required.

1-79. DSCA operations often times create a higher demand signal for VI. These images routinely depict displaced persons and content, which PAOs review before posting. PAOs carefully select and seek legal guidance when considering releasing Army photos during DSCA operations.

PUBLIC AFFAIRS SUPPORT TO JOINT, MULTINATIONAL, AND INTERAGENCY OPERATIONS

1-80. Although the Army may operate as an independent element, it normally conducts operations as part of a joint, multinational, or interagency team. The Army regularly works with other military forces (both other Services and unified action partners), non-DOD government agencies, and NGOs.

1-81. The DOD principles of information do not differ in a joint environment from an Army operation. The primary goal still aims to expedite the flow of complete, accurate, and timely information about the activities of joint forces. Joint PA includes planning, media facilitation, execution of internal and external information strategies, and, when appropriate, training and community engagement. Unless delegated to subordinate commanders, the Office of the Secretary of Defense for Public Affairs is the coordination function for military communication synchronization processes and retains sole release authority of public information concerning all DOD personnel, assets, and operations. (See JP 3-61 for joint PA coordination.)

1-82. Many radio, television, and internet (including wireless) systems have minimum spectrum requirements. These systems might have access to public networks through commercial means or indirectly through tactical networks. The PA office ensures the systems used by PA teams are mutually compatible with the intended electromagnetic environment. (See DODI 3222.03 for more on this compatibility.) To ensure compatibility, PA personnel conduct a spectrum supportability risk assessment (SSRA) for all spectrum-dependent systems. (See DODI 4650.01 and AR 5-12 for using the electromagnetic spectrum.) PA personnel submit SSRA findings to Headquarters, DA, Chief Information Officer, G-6, Army Spectrum Management Office. Additionally, PA personnel complete and submit a DD Form 1494 (*Application for Equipment Frequency Allocation*) to begin the equipment certification process, as required for all spectrum-dependent systems, prior to employment within the United States and Possessions or worldwide. (See AR 5-12 regarding DD Form 1494 and SSRA requirements.)

Chapter 2

Advice and Counsel to the Commander

COMMANDER'S PRIORITIES AND GUIDANCE

2-1. The commander has a responsibility to ensure the American people and Army personnel remain informed and educated on the operations and activities of the Army. The PAO is the commander's key advisor on public communication and communication strategy. Commanders should expect competent PA professionals to provide timely and accurate advice and counsel to ensure that the trust and understanding of the American public is not lost.

2-2. As the face of the organization, the commander is the most visible and credible spokesperson for the command, guiding and integrating successful PA operations. The PAO, the commander's senior advisor on PA activities and communication strategy, is a member of the commander's personal staff. This officer continuously maintains direct and timely access to the commander and other senior-level staff.

2-3. The commander not only ensures the PAO understands the commander's intent for PA activities and communication strategy but also establishes the direct relationship between the commander and PAO. The PAO, in turn, has responsibility to stress the importance of communication and a trusted relationship between the commander and PAO. Failure to convey the importance of a trusted relationship between the commander and PAO may hinder the ability of the commander to communicate timely and accurate information, which can develop into crises that facilitate loss of trust and confidence in the commander and the Army.

2-4. The commander conveys priorities and guidance first hand to ensure the PAO has the necessary requirements to begin developing the commander's communication strategy. Communication plans require command support and involvement. The PAO helps to ensure the commander understands the importance of the commander's role in communicating to internal and external audiences and at times acting as the spokesperson.

2-5. As the primary spokesperson for the command, the commander relies on advice and counsel from the PAO. When communication opportunities arise, the PAO identifies those opportunities and advises the commander on the proposed approach. The commander may sometimes be the subject matter expert required to speak to the public through the media, digital media, or directly at an event. Preparation is usually necessary to ensure the commander can engage effectively in media interviews, engagements, or a speech to an internal audience. (For more information on commander's role, see Chapter 4.)

TIMELY ACCESS

2-6. The commander has numerous staff and limited time available. Nevertheless, the commander should always grant the PAO immediate access using a set of predetermined criteria. Commanders expect the PAO to engage early, articulate the need for timely access, and identify potential risks. Gaining an understanding and assisting in developing the commander's critical information requirements, essential elements of friendly information, and friendly force information requirements is a first step in establishing the criteria for timely access to the commander.

2-7. Commanders expect the PAO, as a member of the personal staff, to work in a command structure that includes a deputy commander, chief of staff, and an executive officer. To develop a sound working relationship with the staff, the PAO communicates regularly with these officers. PAOs gain appropriate access to commanders without circumventing the responsibility and authority of this key leadership element.

INFORMATION RELEASE

2-8. Commanders expect the PAO to advise them on the importance of timely release of public information. The timely release of public information has positive factors as well as negative consequences that may occur when the information appears withheld or delayed unnecessarily. The PAO understands that decisions regarding the timely release of information often depend on the situation.

2-9. The DOD ensures a free flow of news and information to the news media, the American public, the internal audiences of the DOD, and other relevant audiences. The security restraints in DODI 5200.01 and any other applicable statutory and regulatory requirements or exemptions impose limits. DODD 5122.05 explains the DOD principles of information. See figure 2-1 for the DOD principles of information.

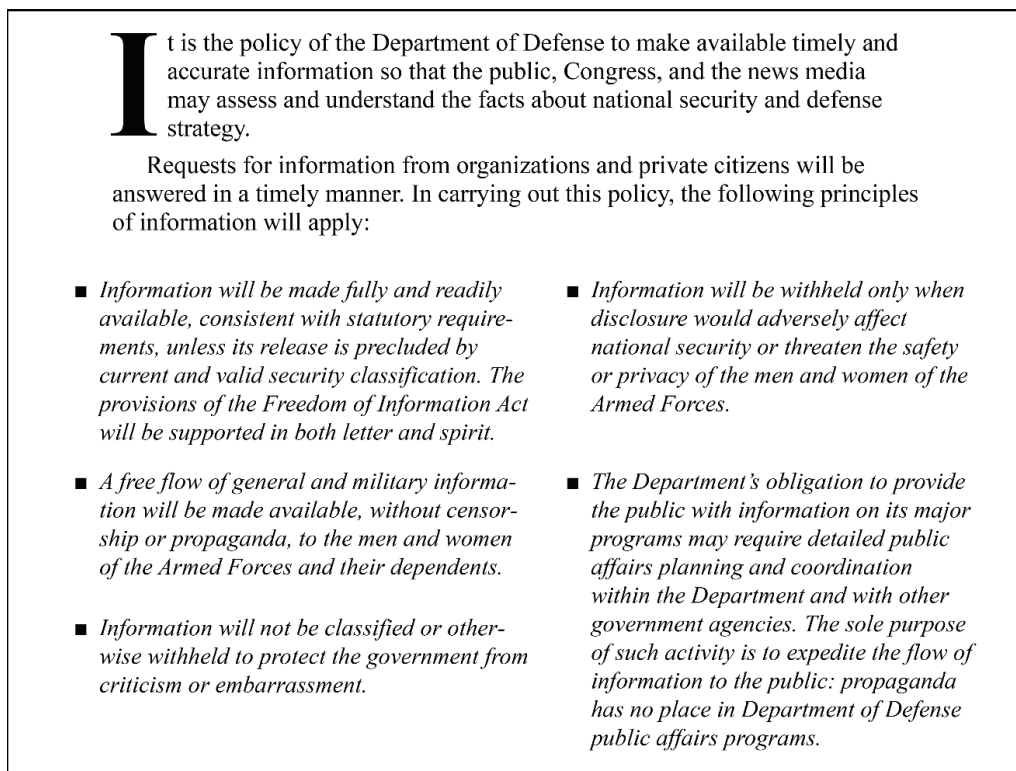

Figure 2-1. DOD principles of information

2-10. Commanders consider the following regarding releasing timely and accurate public information:

- Early release of information sets the pace and tone for solving a problem. It also ensures that PA presents facts accurately from the beginning, rather than attempting to correct the record later. PA professionals ensure they have correct facts, since inaccurate information risks doing more harm than releasing information too slowly.
- Uncontrolled release or leaking of information jeopardizes trust and credibility.
- Information released as early as possible from the correct source assists with accuracy.
- Information released prompts meaningful dialogue and public involvement.
- Information released can prevent similar situations elsewhere.
- Information released counters or mitigates misinformation and disinformation.
- Information released builds public trust and confidence in the command.
- Information released prevents perceptions of scandal or cover-up.

2-11. PAOs coordinate the release of information with the proper release authorities. PAOs reference AR 360-1 and pertinent DOD issuances and directives for guidance when preparing to release information. Implementing this guidance ensures information released to the public is done so correctly.

Chapter 3

Public Affairs Staff and Organization

STAFF AND PERSONNEL

3-1. PA personnel—including commissioned officers, NCOs, and DA Civilians—stand ready to support the commander with knowledge of communication strategy, the information environment, and potential impacts of PA on operations. Ideally, PA leaders are among the most informed in the command. PAOs must be aware of all aspects of an operation. They prepare to convey information and determine how publics may perceive the releasable information.

3-2. PA staffs at all echelons are small and often require augmentation to conduct PA activities, fulfill PA tasks during training, and complete objectives that are essential to the mission. PA planners assess requirements and plan for and request necessary personnel to provide the commander with the effective capability required. Linguists and cultural advisors often work PA activities and are a required consideration during planning. Knowledge of Army PA personnel, staff, units, organizations, and PA activities is necessary to conduct effective PA operations and communication strategies.

PUBLIC AFFAIRS OFFICERS

3-3. Army PAOs are either commissioned officers of the Army primarily in the rank of major or above, or DA Civilians selected and specifically educated, trained, and experienced as PA professionals. PAOs serve on the commander's personal staff with primary responsibilities to assess the information environment, advise senior leaders on PA issues, develop the commander's communication strategy, assist leaders in making well-informed decisions, and translate those decisions into effective PA operations. PAOs develop PA themes and messages for the command that nest with Army messages, plan and execute communication strategies to achieve desired objectives, and evaluate the effectiveness of PA programs. The PAO analyzes the situation, anticipates issues, assesses implications, and develops comprehensive operations to meet the news and informational needs of internal and external audiences. PAOs also facilitate public communication with international and domestic news media. They lead and supervise CCS, public information, engagements, and command information. PAOs oversee PA and VI specialists who create PA and VI products for print, broadcast, and digital media platforms.

3-4. PAOs provide commanders with the expertise and guidance to conduct PA activities through communication strategy and enhance the commander's ability to acquire, process, and deliver information. Duties of the PAO can include the following:

- Maintain the trust of the American public.
- Develop the commander's communication strategy.
- Lead CCS.
- Communicate to deter competitors and help defeat adversaries.
- Develop and execute communication plans.
- Advise senior leaders on the implications of unit actions within the information environment.
- Provide media training for the unit.
- Supervise PA staff.
- Communicate news and information to the internal military audience.
- Respond to media queries.
- Plan and coordinate community events.
- Evaluate the effectiveness of the communication strategy.

PUBLIC AFFAIRS AND COMBAT CAMERA SOLDIERS

3-5. COMCAM NCOs are experts on VI. They supervise, plan, and operate photo, video, and illustration production equipment during operations. The COMCAM junior enlisted Soldier is trained to operate electronic still, video, and audio acquisition equipment to document combat and noncombat Army, joint, and coalition operations. They are trained to operate electronic multimedia imaging equipment and to create illustrations, layouts, posters, graphs, and charts in support of battlefield operations. They are trained and equipped to create VI products to document combat, special operations forces, military intelligence, medical, training, and other functions. They fulfill unit-level maintenance on assigned equipment and operator maintenance on assigned vehicles and generators.

3-6. PA NCOs are experts on the PA functions, core tasks, tenets, and characteristics. NCOs provide the essential functional area expertise and continuity required for successful PA programs and activities. PA NCOs work closely with the PAO. In the absence of a PAO, a PA NCO may serve as the commander's senior PA advisor. Therefore, PA NCOs must be prepared to perform the duties of a PAO.

3-7. The military occupational specialty (MOS) 46S Public Affairs Mass Communication Specialist may be assigned to brigade combat teams, multifunctional brigades, divisions, corps, and theater army staff sections, special operations units, separate PA units, and broadcast communications under the Defense Media Activity. There, they participate in and help execute, supervise, and administer Army PA programs and activities. They are trained and equipped to support the planning, coordination, execution, and supervision of PA operations that seek to inform identified key publics. These specialists use modern technology, equipment, and information systems to collect, process, and rapidly deliver multimedia products supporting public information, command information, communication strategy, and community engagement initiatives. They also fulfill media facilitation responsibilities, conduct PA training, and release information upon approval of the PAO. Finally, they fulfill unit-level maintenance on assigned equipment and operator maintenance on assigned vehicles and generators.

3-8. The MOS 46Z Chief Public Affairs NCO is a sergeant first class and above who supervises personnel performing the duties of PA mass communication specialists. This NCO advises the commander and PAO on all matters pertaining to PA, including command information, public information, and community relations. This NCO also supervises Army PA programs and VI in support of PA operations. The Chief PA NCO advises on accuracy, propriety, timing, and relative importance of information for release to the public and recommends methods of communicating information. This NCO develops, coordinates, and supervises plans and policies pertaining to PA organizations, training, and operations. The Chief PA NCO also serves as the principal NCO in PA and broadcast organizations.

DEPARTMENT OF THE ARMY PUBLIC AFFAIRS CIVILIAN CAREER PROGRAM 22

3-9. Career program (CP) 22 civilian employees perform critical roles in the Army's PA mission. CP 22 includes six occupational series applicable to the PA and communications media professions: 1035 Public Affairs; 1082 Writer-Editor; 0301 Miscellaneous Administration and Program Series (Strategic Communications and Legislative Affairs); 1001 General Arts and Information Series; 1087 Editorial Assistant Series; and 1099 Information and Arts Student Trainee Series.

3-10. PA civilians serve across the Army in support of the DA, Army commands, Army Service component commands, direct reporting units (DRUs), field-operating agencies, and other positions requiring professional communicators. They work as PAOs, communication planners, media relations officers, writers and editors, digital content managers, visual arts specialists, speechwriters, congressional affairs specialists, strategic communicators, and editorial assistants. CP 22 professionals develop and maintain working relationships with media representatives as well as serve as liaisons with academic, civic, business, and government organizations.

3-11. The CP 22 workforce has a centralized training and development program that provides sequential and progressive training for communication functional specialties and in leadership, supervision, and managerial development. The CP 22 Army Civilian Training, Education and Development System (ACTEDS) plan provides general information and guidance on managing the Public Affairs and Communications Media Career Program. This program includes career progression ladders, core functional competencies, master training plans, and mobility and continued service requirements. The CP 22 manager facilitates central

training, education, and development opportunities for PA careerists as defined by the ACTEDS plan and CP 22 career maps. PA specialists also attend the Civilian Education System leadership courses.

3-12. Civilian PA specialists have the same skills and competencies as their military counterparts. Continuity of operations is one of the civilian PA specialist's most critical roles. They support military operations by providing a direct and vital link between deployed forces and the home-station community. In some situations, civilian PA specialists deploy with units they support or as an individual augmentee. During disaster operations supported by the Army Corps of Engineers in the United States, a civilian PA specialist often serves as a primary Army liaison in affected communities. Civilian PA specialists participate in the full range of PA missions from community relations and outreach to communication planning and media operations. Senior civilian PA professionals develop and execute communication strategies, conduct analyses, and assess communications operations. They lead, manage, and train other PA personnel.

PUBLIC AFFAIRS AND VISUAL INFORMATION EDUCATION AND TRAINING

3-13. PAOs, Soldiers, and select DA Civilians receive their functional areas and MOS qualifications at the Defense Information School. PA NCOs receive additional PA training through the Army's Noncommissioned Officer Professional Development System schools. Like their Regular Army counterparts, Reserve Component Soldiers must meet the same basic and advanced educational requirements. All initial entry and accessions Soldiers attend the Military Communication Foundation course to qualify as a MOS 46S Public Affairs Mass Communication Specialist. (See DA Pam 611-21 for MOS classification structure.)

3-14. Both FA 46 Officers and CMF 46 Soldiers have additional opportunities. They can apply to attend advanced PA training at the Defense Information School, to train with industry, and to enroll in advanced civilian education options. (See DA Pam 600-3 for officer professional development programs and DA Pam 600-25 for NCO professional development programs.)

PUBLIC AFFAIRS ORGANIZATIONS AND ROLES

3-15. The Secretary of the Army has sole responsibility for the function of Army PA and designates the Office of the Chief of Public Affairs to perform the duties of formulation and promulgation of Army PA policy. (See Title 10, Section 7014, USC for the Secretary of the Army's responsibilities.) Commanders or their designated official spokespersons, who must be military or Army civilian officials, conduct PA in accordance with policy.

3-16. The commander is responsible for PA at all levels of command. PAOs serve on the commander's personal staff. In accordance with AR 360-1, commanders cannot delegate this function to any other staff function.

3-17. Commanders staff PA sections of operational units at their minimum-essential wartime requirements. When validating for readiness, mobilizing, or deploying, a unit may require PA unit augmentation to support the mission through appropriate operations channels. Commanders include PAO in planning and are able to request PA augmentation, which may be provided in alignment with mission requirements. Without proper planning and additional PA support, the commander may have degraded PA capability and capacity.

3-18. At home station, operational units and installation tenant organizations, with and without assigned PA staffs, receive limited PA support from the garrison PA office.

OFFICE OF THE CHIEF OF PUBLIC AFFAIRS AND DIRECTOR OF ARMY COMMUNICATIONS

3-19. The Chief of Public Affairs (CPA) is a general officer who is primary staff to the Secretary of the Army and answers to the Chief of Staff of the Army. The Secretary of the Army assigns the CPA the responsibility of personnel developer and force modernization proponent for Army PA. The Office of the Chief of Public Affairs (OCPA) is a headquarters, DA element at the Pentagon. It has several field operating agencies:

- OCPA West in Los Angeles: the principal PA liaison between the Army and the entertainment, television, and motion picture industries.
- OCPA Northeast in New York City: the principal PA liaison with broadcast, print, publishing, advertising, theatrical, and independent creative communities.

- OCPA Midwest in Chicago: the PA liaison that develops public support for the Army and its Soldiers through community outreach, media engagements, and support to veterans and military support organizations across the 16-state Midwest region.

Regional branch offices, as directed by the CPA, provide liaison and support to the Army, other Services, and local Army commands throughout the continental United States. (For more information on OCPA, see AR 360-1.)

ARMY PUBLIC AFFAIRS CENTER

3-20. The Army Public Affairs Center serves as the proponent executive agent for the CPA. This center develops, provides guidance for, and prepares Army PA doctrine, organizations, training, materiel, leadership and education, personnel, facilities, and policy (known as DOTMLPF-P).

ARMY BANDS

3-21. The OCPA has policy oversight of Army bands. Army bands promote the Army and national interests and enable commanders to shape the environment to accomplish their missions. These bands set the conditions that lead to public trust and confidence in the Army and its readiness to conduct operations in peace, conflict, and war. (For more information on bands, refer to ATP 1-19.)

3-22. The OCPA manages policy for the U.S. Army Field Band (known as USAFB). The Army Field Band conducts international and national concert tours in support of Army PA objectives. Its mission is to inspire the American people by telling the Army story, honoring Soldiers and veterans at home and abroad, and acting as the musical ambassadors of the Army.

ARMY COMMANDS PUBLIC AFFAIRS SECTION

3-23. Army commands (ACOMs) include Forces Command, Army Materiel Command, Training and Doctrine Command, and Futures Command. Commanders of ACOMs are senior Army leaders. They report to the Chief of Staff of the Army and to the Secretary of the Army for the organization, training, and equipping of the Army.

FUNCTIONS

3-24. The ACOM communications staff provides PA counsel to the ACOM commander and staff. This staff exercises functional planning, preparation, execution, and assessment authority for subordinate unit PAOs by, with, and through the chain of command. All ACOM directors of communications coordinate leader communication activities as part of Army strategy. They represent subordinate unit initiatives and issues in the OCPA communication process. The ACOM commander adequately organizes and resources the structure and capabilities of ACOM staffs to provide core communication functions within doctrinal staff organizations.

ORGANIZATION

3-25. ACOM PA staffs organize to sustain core functions appropriate to their echelons. ACOM staffs participate in design and planning activities like operational planning teams and working groups. An effective ACOM PA staff responds promptly to subordinate unit requests for guidance, planning, and assessment assistance. The ACOM PA staff represents subordinate units to OCPA's synchronized communication activities to include ACOM submissions for Army-level support on behalf of subordinate unit PA activities.

ARMY SERVICE COMPONENT COMMAND COMMUNICATIONS SECTION

3-26. The Army Service component command (ASCC) communications section provides PA support to the ASCC commander.

FUNCTION

3-27. The ASCC communications section exercises planning and supervisory authority over all PA and COMCAM units assigned, attached, or under the operational control of the theater army command. The ASCC PA section coordinates closely with the PA sections of other government agencies, coalition commands, and other forces, when appropriate, to conduct PA and communications activities. The ASCC director of communications leads CCS and directs theater-wide PA planning, priorities, and activities to ensure alignment with the ASCC commander's communication strategy and guidance.

STRUCTURE AND CAPABILITIES

3-28. The ASCC PAO is a FA 46 qualified colonel who serves on the commander's personal staff and may not be delegated to any other staff function. A sergeant major serves as the senior PA enlisted advisor. The PA section is organized, staffed, trained, and equipped to support Army theater-level operations and to direct PA activities in support of the commander's communication strategy. The ASCC PAO leads the assessment of the theater PA situation and information environment. This PAO analyzes guidance from higher headquarters to include campaigns, themes, messages, narratives, talking points, and communication objectives and coordinates with unified action partners and any other publics in the theater. The ASCC PAO and staff identify factors in the information environment that have potential implications for the planning and execution of operations, as well as the information requirements and needs of internal and external audiences. The ASCC PAO also develops PA planning through PA running estimates, proposed PA guidance, and development of Annex J (Public Affairs) in the operation order. PA planning includes any necessary PA unit augmentation, such as a theater public affairs support element or COMCAM support. A theater public affairs support element is the primary PA unit designed to augment an ASCC. (See paragraph 3-77 for more on theater public affairs support element.)

CORPS PUBLIC AFFAIRS SECTION

3-29. A corps or theater army PA section provides PA support to a corps commander and assigned units.

FUNCTION

3-30. A corps PAO exercises planning and supervisory authority over PA units attached, assigned, or under the operational control of the corps headquarters. The commander cannot delegate this PAO to any other staff function. A corps PAO leads CCS and coordinates closely with PA sections of higher, lower, and adjacent commands, and other forces to carry out the corps commander's PA activities. This PAO also ensures alignment with higher command communication strategies and guidance.

STRUCTURE AND CAPABILITIES

3-31. A corps PAO is a FA 46 qualified colonel who serves on the personal staff of a corps commander and leads a PA section within the corps headquarters. The commander cannot delegate this corps PAO to any other staff function. A sergeant major serves as the senior PA enlisted advisor. The section is organized, staffed, trained, and equipped to deploy rapidly in support of military operations. The section assesses the PA situation by analyzing guidance from higher headquarters to include campaigns, themes, messages, narratives, talking points, and communication objectives. The section also coordinates with unified action partners and any other entities within the corps area of operations. The corps PAO identifies factors in the information environment that have potential implications for the planning and execution of operations, as well as the information requirements and needs of internal and external audiences. The corps PAO also develops PA planning through PA running estimates, proposed PA guidance, and development of Annex J (Public Affairs) in the operation order. Such detailed planning includes any necessary PA unit augmentation, such as mobile public affairs detachment or COMCAM support. The mobile public affairs detachment is the primary PA unit designed to augment a corps. (See paragraph 3-69 for more mobile public affairs detachment.)

DIVISION PUBLIC AFFAIRS SECTION

3-32. The division PA section provides PA support to the division commander and assigned units.

FUNCTION

3-33. The division PAO exercises planning and supervisory authority over all PA units attached to or under operational control of the division headquarters or within the division operational area. The division PAO leads CCS and carries out the division commander's communication priorities by closely coordinating lower echelon PA sections and ensuring alignment with higher command communication strategies and guidance.

STRUCTURE AND CAPABILITIES

3-34. The division PAO is a FA 46 qualified lieutenant colonel who serves on the personal staff of the division commander. The division PAO may not be delegated to any other staff function. A master sergeant serves as the senior enlisted advisor and NCO in charge. The staff section is organized, staffed, trained, and equipped to deploy rapidly in support of division-size task force operations. The section assesses the PA situation by analyzing guidance from higher headquarters to include campaigns, themes, messages, narratives, talking points, and communication objectives, and coordinating with unified action partners and any other entities within the division area of operations. The division PAO identifies factors within the information environment that have potential implications for the planning and execution of operations, as well as the information requirements and needs of internal and external audiences. The division PAO also develops PA planning through PA running estimates, proposed PA guidance, and development of Annex J (Public Affairs) in the operation order that will include any necessary PA unit augmentation, such as a public affairs detachment or COMCAM support. A PA detachment is the primary PA unit designed to augment a division. (See discussion beginning in paragraph 3-66 for more on public affairs detachment.)

BRIGADE COMBAT TEAM PUBLIC AFFAIRS SECTION

3-35. The brigade combat team (BCT) PA section supports the brigade commander and assigned units.

FUNCTION

3-36. The BCT PAO exercises planning and supervisory authority over PA units assigned, attached, or under operational control to the brigade headquarters. The BCT PAO leads CCS and coordinates closely with higher echelons and other forces to carry out PA activities and ensure alignment with higher commander communication strategies and guidance.

STRUCTURE AND CAPABILITIES

3-37. The BCT PAO is a FA 46 qualified major and serves on the personal staff of the brigade commander. A staff sergeant serves as the PA noncommissioned officer. The staff section is organized, staffed, trained, and equipped to deploy rapidly in support of brigade task force operations and may not be delegated to any other staff function. The section assesses the PA situation by analyzing guidance from higher headquarters to include campaigns, themes, messages, narratives, talking points, and communication objectives, and coordinating with unified action partners and any other entities within the brigade area of operations. The BCT PAO identifies factors within the information environment that have potential implications for the planning and execution of operations, as well as the information requirements and needs of internal and external audiences. The BCT PAO also develops PA planning through PA running estimates, proposed PA guidance, and development of Annex J (Public Affairs) in the operation order that will include any necessary PA unit augmentation, such as a public affairs detachment or COMCAM support. Depending on mission requirements, a public affairs detachment will augment a BCT or COMCAM team. (See discussion beginning in paragraph 3-68 for more on public affairs detachment.)

MULTIFUNCTIONAL AND FUNCTIONAL BRIGADES PUBLIC AFFAIRS SECTIONS

3-38. Multifunctional and functional brigade PA professionals provide PA support to the commander and assigned units. Multifunctional brigades include fires, maneuver enhancement, military intelligence-expeditionary, combat aviation, and sustainment brigades. Functional brigades include air defense artillery, chemical, engineer, military intelligence, military police, signal, explosive ordnance disposal, medical, regional support groups, and theater aviation brigades.

FUNCTION

3-39. The brigade's PA section coordinates closely with the supported command to plan and conduct PA activities and ensures those activities are aligned with higher echelon command communication strategies and guidance.

STRUCTURES AND CAPABILITIES

3-40. The brigade PAO is a FA 46 qualified officer or senior PA NCO and serves on the personal staff of the brigade commander. A sergeant serves as the PA NCO. The section assesses the PA situation by analyzing guidance from higher headquarters to include campaigns, themes, messages, narratives, talking points, and communication objectives, and coordinating with unified action partners and any other entities in the brigade area of operations. The brigade PAO identifies factors in the information environment that have potential implications for the planning and execution of operations, as well as the information requirements and needs of internal and external audiences. The brigade PAO also develops PA planning through PA running estimates, proposed PA guidance, and Annex J (Public Affairs) in the operation order that will include any necessary PA unit augmentation, such as a PA detachment.

3-41. Depending on mission requirements, a PA detachment augments a multifunctional or functional brigade. When augmented by a public affairs detachment team, the public affairs detachment officer in charge may serve as the brigade PAO in the absence of an assigned or authorized PAO. (See discussion beginning in paragraph 3-66 for more on PA detachment.)

SPECIAL OPERATIONS FORCES PUBLIC AFFAIRS AND COMBAT CAMERA

3-42. Special operations forces (SOF) have assigned Army PA and COMCAM personnel at the U.S. Special Operations Command, Joint Special Operations Command, Theater Special Forces Commands, U.S. Army Special Operations Command, 1st Special Forces Command, special forces groups, and MISO battalion level.

FUNCTIONS

3-43. The SOF PA staff is responsible to advise the SOF commander on the impact their operations might have in the public realm and to serve as the spokesperson for the unit. Due to the nature of special operations, SOF PA personnel have a unique responsibility to ensure that policies regarding the release of information and imagery are followed in accordance with local command policy.

3-44. The SOF PAO, or commander-designated representative, may serve as the link between the command and the senior U.S. Department of State representative or other designated authority responsible for releasing information to the host-nation media during foreign internal defense and unconventional warfare operations, exercises and missions involving extensive interaction with the host-nation population.

3-45. The SOF PA staff often reports or coordinates directly with a theater special operations command (TSOC), special operations command (SOC), or joint special operations command (JSOC) PAOs for planning, guidance, and release authority.

STRUCTURE AND CAPABILITIES

3-46. A SOF PA section is normally composed of a PA-trained officer who serves on the commander's personal staff and NCO who serves on the special staff. The rank and grade structure of individual SOF units depends on their authorizations. The PA staff section supports and receives support from higher echelon PA staffs.

UNIT PUBLIC AFFAIRS REPRESENTATIVES

3-47. The UPAR program is designed to facilitate commanders' operations in the information environment. In accordance with AR 360-1, PAOs are responsible for cultivating UPARs in their units. At a minimum, PAOs train UPARs on PA plans and policies, embedded media, engaging local media, and conducting media opportunities at the battalion level and below. The required training for UPARs can be found on the Army Learning Management System (ALMS) website. The PAO and the UPAR both must maintain the certificate gained from the UPAR course.

3-48. UPARs are assigned through additional duty appointment orders to represent their units for PA functions. UPARs increase PA capability across a command and provide products to the PAO for editing and formatting. While UPARs can create products, the PAO maintains release authority, which cannot be delegated. When UPARs are designated and assigned UPAR duties through additional duty orders, the commander is responsible for equipping them. The UPARs require professional photography equipment. The higher echelon PA office provides guidance for selecting the correct equipment. Ideally, commanders equip UPARs with the same program of record equipment that Army PA professionals use to maintain continuity and facilitate further UPAR training.

GARRISON PUBLIC AFFAIRS OFFICE

3-49. The garrison PA office provides standard PA services to an installation. Garrison PA support depends on staff size, which varies based on mission and tenant unit requirements.

FUNCTION

3-50. Normally on Army installations, the garrison PA staff support the senior mission commander, garrison commander, and tenant commanders. The PA staff plan and execute PA activities in close coordination with partner and higher echelon commands to ensure the Army speaks with one voice. On a joint base, garrison PA support may vary based on tenant unit make-up and the military service of the senior commander.

STRUCTURE AND CAPABILITIES

3-51. The garrison PA office is primarily composed of DA Civilians (CP 22) who serve on the staff of the garrison commander. The garrison PAO supports and coordinates with tenant and partner units on PA operations affecting the installation by identifying factors in the information environment that have potential implications for the planning and execution of garrison operations, as well as the information requirements and needs of internal and external communities and audiences. Garrison PAO develops PA plans through PA running estimates, proposed PA guidance, and Annex J (Public Affairs) of the operation order when applicable.

EXTERNAL ORGANIZATIONS

3-52. Army PA have relationships with organizations, such as the Defense Media Activity, Office of the Assistant to the Secretary of Defense for Public Affairs, Defense Information School, U.S. government agencies, and NGOs.

U.S. GOVERNMENT

3-53. Effective PA activities require close coordination among the U.S. military, the Department of State, Department of Homeland Security, and other U.S. government agencies. Normally, executive orders define agency roles, functions, and interagency relationships.

DEPARTMENT OF STATE

3-54. The Department of State implements foreign policy. Due to its mission, the Department of State has a stake in PA activities. PA and other capabilities contributing to defense support to public diplomacy coordinates communication with the respective American Embassy PAO to optimize effects and the achievement of goals. In the area of PA, the Department of State has a primary or shared role with the DOD for policy concerning—

- The extent U.S. forces will aid host-nation governments.
- Matters that may affect U.S. relations with other nations, principally allies or neutrals.
- The level at which a country's economy will be maintained by U.S. operations.
- Matters involving MISO, PA, civil affairs, information synchronization, or other measures to inform or influence the attitude of a public.

3-55. The Department of State engages international key publics on issues of U.S. policy, society, and values to help create an environment that can be receptive to America's national interests. Commanders must coordinate and synchronize their plan for PA activities with these and other national-level communication initiatives.

DEPARTMENT OF HOMELAND SECURITY

3-56. During national emergencies in the United States, Army PA personnel may be called upon to provide support. The Department of Homeland Security, through the Federal Emergency Management Agency (known as FEMA) and in coordination with affected state and local governments, is normally the lead agency for the federal response. Army PA personnel must understand and abide by the release authorities established by the civil authorities. (See paragraph 1-74 for more on DSCA.)

DEFENSE MEDIA ACTIVITY

3-57. The Defense Media Activity consolidates several DOD and Service media capabilities and is the DOD's direct link to U.S. forces worldwide for news and information. The agency presents news, information, and entertainment via radio, television, internet, print media, and emerging media technologies. Located at Fort Meade, Maryland, the Defense Media Activity reports to the Office of the Assistant to the Secretary of Defense for Public Affairs.

DEFENSE INFORMATION SCHOOL

3-58. The Defense Information School (DINFOS) is a component of the DOD's Defense Media Activity. Its primary purpose is to train Service members of all military branches in the fields of mass communication, PA, and VI. In addition, selected DOD civilians and international military personnel can attend DINFOS for many of its courses. DINFOS is a DOD school located at Fort Meade. (See paragraph H-4 for more information on DINFOS.)

NGONGOVERNMENTAL ORGANIZATIONS

3-59. NGOs and humanitarian groups, such as the International Committee of the Red Cross, American Red Cross, and other humanitarian organizations, are often located in geographic areas before, during, and after military operations. They are often present before the media arrive and initial sources of information for journalists. NGOs also may serve as major sources of information during an operation. In many cases, the unit PAO, public affairs detachment, or mobile public affairs detachment may be tasked to support the Civil Affairs Command in the civil-military operations center.

3-60. Before deploying, PA personnel learn the agencies and organizations in their assigned area. These organizations may conduct short-term humanitarian or long-term developmental operations. Sponsoring groups or agencies can include private corporations, foundations, professional associations, or religious groups. PA personnel must understand the agencies and organizations' goals, establish an understanding of their potential PA needs, and understand the legal parameters of cooperation with NGOs. NGO representatives may have valuable local knowledge to assist PA activities.

PUBLIC AFFAIRS UNITS

3-61. Army PA units augment ASCC, corps, division, and brigade as well as special forces groups (Airborne), and other organic PA staffs to provide PA capabilities.

3-62. PA units are designated as standard requirements code (SRC) 45 units. They require administrative and life support functions from the commands to which they are assigned or attached. These units may support any of the following centers: joint information centers, MOCs, press information centers, allied press information centers, or coalition press and information centers as the situation and mission dictate. SRC 45 units may be attached or directed to support partner nations during multinational operations, exercises, and training.

3-63. Most SRC 45 units are in the United States Army Reserve and Army National Guard. These units integrate with Regular Army units to meet the commanders' requirements through the deliberate planning process and various operation and contingency plans.

3-64. Because of their modular design, SRC 45 units often provide Army support to other Services, such as a Marine expeditionary force, a joint special operations task force, or an air expeditionary wing. These units routinely support interagency requirements of national importance, such as DSCA.

3-65. There are four types of PA SRC 45 units:

- Public affairs detachments.
- Mobile public affairs detachments.
- Broadcast operations detachments.
- Theater public affairs support element.

PUBLIC AFFAIRS DETACHMENT

3-66. During deployment a public affairs detachment (PAD) supports the PAO of the augmented unit at a brigade or higher. A PAD consists of two fully functional teams that may deploy independently. See figure 3-1 for the PAD task organization.

Figure 3-1. Public affairs detachment task organization

Mission

3-67. A PAD provides direct PA support to units of armored, infantry, or Stryker BCTs, a special forces group, civil affairs brigade, or headquarters and headquarters company and special troops battalion sustainment brigade.

Structure and Capabilities

3-68. PADs are led by a FA 46-qualified captain who provides command and control over the two PAD teams during home station training. This captain serves as a deputy PAO or planner for the supported command PAO during deployment. The two teams may deploy independently to support operations including stability, transition, and reconstruction operations. PADs provide assistance and advice to the supporting unit's PA office; augment command information programs; transmit command information products between higher and lower echelon headquarters; provide limited electronic audio support, video support, and news gathering; and assist in managing digital media platforms.

MOBILE PUBLIC AFFAIRS DETACHMENT

3-69. Mobile public affairs detachments (MPADs) support the PAO of an augmented unit at the division echelon or higher or as missions require. See figure 3-2 for task organization of a MPAD.

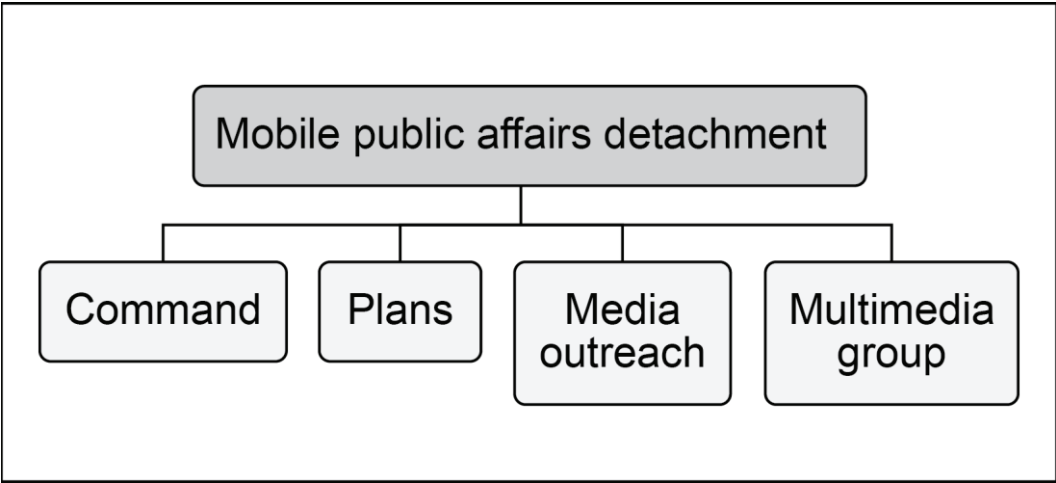

Figure 3-2. Mobile public affairs detachment task organization

Mission

3-70. A MPAD provides direct PA support through planning, coordination, execution, and supervision of expeditionary and campaign PA operations in support of theater army, joint, interagency, intergovernmental, and multinational and unified operations. On an as needed basis, MPADs augment the supported command PA staff.

Structure and Capabilities

3-71. MPADs are commanded by a FA 46-qualified major who provides command and control over the MPAD teams during home station training. This major serves as a deputy PAO or planner for the supported command PAO during deployment. A MPAD consists of a detachment headquarters section, plans section, media outreach section, and multimedia section. MPADs provide PA staff support to the mission commander including planning, analysis, synchronization, and supervision in support of the commander's information strategies and communication objectives. These PA capabilities encompass personnel and equipment to facilitate media relations, engagements, and operations, to include establishing, operating, and maintaining MOCs. Other PA support includes providing logistics support of media pools and embed programs, conducting live media interviews and briefings, and providing appropriate technologies to facilitate

international, national, and local media. MPADs acquire, produce, transmit, and distribute complete, accurate, and timely digital multimedia print and broadcast products in support of PA activities. MPADs can also conduct and evaluate PA training programs.

BROADCAST OPERATIONS DETACHMENT

3-72. A broadcast operation detachment (BOD) provides audio-visual and broadcast support at the theater level. See figure 3-3 for task organization of a BOD.

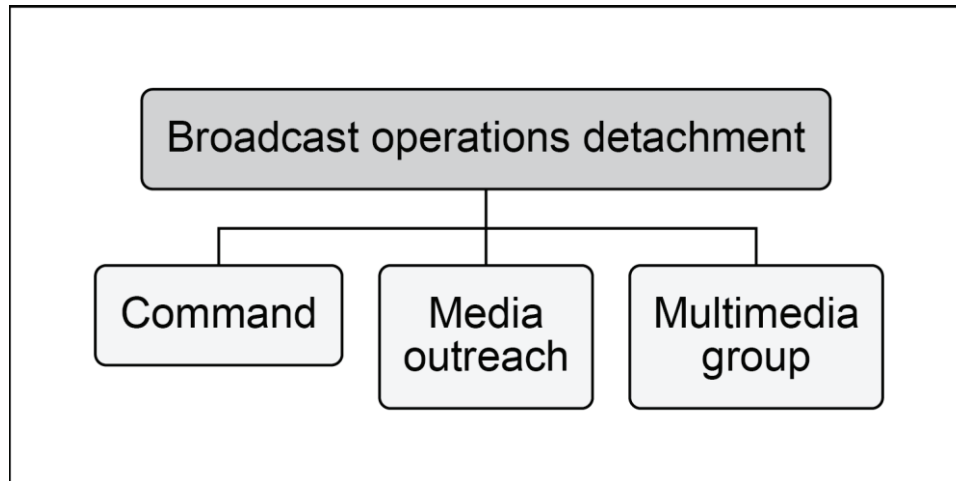

Figure 3-3. Broadcast operations detachment task organization

Mission

3-73. The BOD operates and maintains an established theater-level radio, an established television broadcast facility, and multimedia platforms to meet the senior commanders' internal and external communication objectives and information requirements.

Structure and Capabilities

3-74. BODs are commanded by a FA 46-qualified major. A BOD consists of a detachment headquarters, a multimedia team, and a maintenance team. BODs are assigned to a theater army as needed. They can support the higher echelon PAO or staff with planning and information strategy requirements. BODs can operate a 24-hour-a-day internal information, over-the-air broadcast service as well as manage and maintain broadcast facilities when coordinating with the Defense Media Activity or theater command-provided studio equipment. BODs perform digital multimedia, video, and audio electronic news gathering in the theater of operations, provide limited post-production services for audio and video news feature material supplied in unedited format by other units, and provide electronic audio and video support to the Defense Media Activity operations.

THEATER PUBLIC AFFAIRS SUPPORT ELEMENT

3-75. A theater public affairs support element (TPASE) is the most capable and tactically diverse PA unit. It provides PA support at the theater level or as a mission requires. See figure 3-4 on page 3-13 for the task organization of a TPASE.

Figure 3-4. Theater public affairs support element task organization

Mission

3-76. The TPASE provides direct PA support through planning, coordination, execution, and supervision of PA operations in support of theater army, joint, interagency, intergovernmental, and multinational operations.

Structure and Capabilities

3-77. A TPASE is normally assigned at the corps, theater army, or combatant command-level to provide the organic PA staff with increased capabilities. The TPASE is commanded by a FA 46-qualified lieutenant colonel who provides control over the TPASE during home station training. This officer serves as a deputy PAO or MOC director for the supported command PAO during deployment. The TPASE is organized with a command section, media operations section, multimedia team section, and plans and operations section. This element provides advice and counsel; conducts PA planning; conducts PA training; facilitates media relations; and facilitates public communication and community engagement. Generally, the TPASE is the lead element for the gaining command to facilitate media operations in theater. The commander may task and deploy the TPASE in teams according to the mission and gaining command PA augmentation requirements.

COMBAT CAMERA

3-78. A COMCAM company is a force enabler composed of highly trained VI professionals prepared to deploy to the most austere environments at a moment's notice. Skilled in acquiring and using still and motion imagery, COMCAM teams attached to a BCT, divisions, corps, or theater army provide commanders with directed imagery capability. This capability supports operational planning, PA, IO, operations assessment as well as forensic, legal, intelligence, and other requirements during crises, contingencies, and exercises around the globe.

Mission

3-79. COMCAM forces perform unique and highly specialized missions with digital and analog VI documentation capabilities. They support armed forces in war, natural disasters, and training activities.

Structure and Capabilities

3-80. COMCAM companies are commanded by a field grade officer trained on VI management. COMCAM consists of a company headquarters, a tactical operations section, an airborne support section, and three support platoons. Army COMCAM companies provide command, control, and supervision of the operations and activities of assigned COMCAM platoons. They also serve as liaison to supported units, a joint

COMCAM team, and other Service COMCAM elements. COMCAM companies acquire still and video imagery of land, static airborne, and air assault operations and provide presentation and exploitation of visual imagery in support of operational requirements. COMCAM companies establish, operate, and maintain COMCAM facilities required to support theater-level and subordinate tactical command post headquarters. These companies have the training and equipment to operate in all weather and lighting conditions with conventional and special operations units. They maintain airborne qualified Soldiers and conduct other advanced tactical training that may include air assault, combat lifesaver, and advanced marksmanship techniques, enabling them to operate with airborne forces and SOF in areas inaccessible to media or other VI personnel.

PART TWO

Public Affairs Operations

Part two of this publication covers and discusses public affairs operations. Commanders expect public affairs leaders, Soldiers, and civilians to conduct public affairs operations. Public affairs operations encompass all the collective and individual tasks of public affairs organizations and personnel. Effective public affairs personnel understand the information discussed in this part of the publication. Part two is intended to assist public affairs personnel in executing their tasks. It is not intended to provide instructions on how to perform those tasks. Readers can find instructions on how to perform the tasks and procedures involved at the Central Army Registry (CAR) website.

Chapter 4

Public Affairs Training

4-1. Providing PA training to non-PA units is a U.S. Army public affairs core task. PA provides commanders with trained units, leaders, and individuals in support of the mission. PA Soldiers and civilians begin their training when they take their oath and enter Army service. Proper PA training enables commanders, staffs, and Army leaders to recognize, understand, and plan for the strategic, operational, and tactical impact of communications in the information environment.

4-2. Operational success depends on commanders ensuring forces receive well planned, standardized, realistic, rigorous, and performance-based training. Training requires adaptation and flexibility to ensure forces are prepared to engage adversaries using emerging and ever-changing strategies, tactics, and technology. All command echelons focus PA training on integrating PA equities into planning during the MDMP, and taking the necessary steps to synchronize and coordinate communications with other IRCs.

4-3. PA leaders train Soldiers for the range of military operations. These include low-intensity conflicts with violent extremist organizations as well as multi-domain operations designed to deter and defeat near-peer aggression in both competition and conflict. All training ensures PA personnel are ready to deploy, fight, and win. PA training follows the operations process. Commanders and PA leaders assess unit training and leader development through unit training management systems. (See Appendix H and FM 7-0 for detailed information regarding Army training.)

4-4. The presence of media representatives in the Army's operational theaters is a fact. Media interaction is more a question of when as opposed to if it happens. Conducting interviews is an important part of the PA mission and a part of public communication. Soldiers, leaders, DA Civilians, and Family members are the Army's best spokespersons. They must be prepared to interact with civilian reporters, in some cases, without direct assistance from PA personnel. Conducting media interaction training with non-PA personnel helps tell the Army story.

4-5. PA planners identify non-PA assets that could assist in executing the commander's communication strategy. Non-PA assets can directly impact communication throughout an operation and must be taken into consideration while developing training. PA conducts media engagement training for non-PA personnel to

ensure effective communication and support to the commander's information objectives. Media engagement is deliberate engagement with the media by public affairs or a unit command team. Media engagement will always involve PA presence. Organizations, units, and individuals may require media engagement training depending on the requirements of the commander's communication strategy. PA staff conducting the training reference the approved communication plan for information necessary to facilitate media engagement training such as tactics, messages, and talking points.

4-6. Effective PA sections and units conduct challenging training to prepare commanders and spokespersons to communicate the Army message. PA professionals conduct PA training ranging from familiarization training in an auditorium to focused one-on-one interview rehearsals with subject matter experts as well as general training of allies and unified action partners.

4-7. PA professionals help prepare commanders and leaders for public speaking engagements. Commanders, often through their PAOs, maintain a continuous dialogue with media representatives covering military activities. Most media representatives strive to publish accurate, truthful, balanced stories. They aim to report fairly and not to undermine, interfere, or misrepresent the military, its operations, or activities. The PAO has no editorial control over media representatives. Commanders must understand that some media representatives do not always tell the story the commander wants them to tell. Because of this, some stories may result in misunderstandings, errors, or criticisms. In these cases, commanders and PAOs may seek to push back against inaccurate news reports, but balance this against an understanding of the impact of command actions on perceptions, attitudes, and beliefs of the media. The commander formulates and delivers timely and culturally attuned messages to counter potential misperceptions. Successful media engagements start with planning and training.

MEDIA FAMILIARIZATION TRAINING

4-8. The Army has recognized the importance of non-PA Soldiers, DA Civilians, and Family members interacting with the media. PA Soldiers have an individual task to conduct media interaction training for non-PA personnel. PA Soldiers train commanders, non-PA Soldiers, DA Civilians, and Family members on properly conducting a media interview and on understanding performance measures used to measure success.

TRAINING AUDIENCE

4-9. PA professionals provide training on interaction with the media. First, they identify the training audience. When planning the training, the instructor identifies the audience. After identifying the audience, instructors seek to understand it. Understanding includes identifying the audience's level of experience and mission. An instructor might seek answers to the following questions to prepare tailored training for the group:

- Is the audience a unit? Has it deployed recently?
- What media training has audience received at this point?
- Is the audience solely junior enlisted, NCOs, officers, or is it a diverse group?
- What is the primary mission and deployment destination of the audience?

TRAINING METHOD

4-10. Following identification and understanding of the training audience, the instructor selects the training method. Selecting the training method facilitates providing effective media interaction training. Instructors consider training objectives, location, time allotted, number of participants, training materials, and training resources such as number of instructors and evaluators. Instructors have several ways to conduct media interaction training with non-PA personnel. They consider creative new methods, opportunities, and technology. See table 4-1 for possible methods that increase in difficulty in skill.

Table 4-1. Methods of training

Method	Example	Purpose
Media training briefings	A slide presentation normally conducted in a garrison or off-site training facility.	Explains the role of public affairs, available public affairs support, nature and needs of the media, and guidance for spokespersons.
Mock interviews	Information, demonstration, and coaching with a facilitated mock media interview.	Provides realistic and mission-relevant interview questions using media role players. Demonstrates the difficulty of an interview, identifies the trainee's strengths and weaknesses, and teaches how to improve where needed. Records interview training session (on camera, print, or livestream) so trainees can see from a third-person perspective how they performed. Facilitates feedback for the entire training group.
Media on the battlefield training	Field training exercises in which media role players interact with Soldiers during operations.	Supports the principle of train as we fight by providing of the most realistic training environment possible. Affords the commander an opportunity to view their Soldiers' ability to communicate with the media and assess their capability under stressful conditions.
Troop cards	Wallet-sized, laminated cards printed using standard computer-based publication design programs. Dispersed during media training events.	Gives Soldiers, Department of the Army Civilians, and Family members a portable tool to reference before a media interaction. Provides command messages, talking points, media interview tips, common questions and answer suggestions, and public affairs points of contact information.

TRAINING STRATEGY

4-11. Selecting the training strategy is necessary and determines the amount, type, and pace of training required for the training audience or individual. A training strategy may be to conduct the training using either the crawl, walk, run method or a combination method.

4-12. The crawl, walk, run method works best when commanders allotted two weeks or months for training before the exercise or deployment. The crawl level can consist of a media training briefing. The walk level might consist of mock interviews. The run level might consist of media on the battlefield training. This method provides levels of training, builds on acquired skills, incorporates evaluation time, and identifies additional training requirements. The training increases in complexity and resource requirements as the trainee develops capability. While the crawl, walk, run training strategy can often result in a higher level of proficiency, it leaves less time for additional training if evaluator has noted any deficiencies. In some cases, combining various training events into one period may be a necessity when time or days between training events are not practical.

TRAINING DEVELOPMENT

4-13. Each training method requires different information, skills, and references. Instructors and trainers carefully research, plan, and develop a program of instruction or training tasks using the latest approved policy, doctrine, tactics, techniques, and procedures. PA professionals conducting media interaction training can reference PA individual and collective tasks located on the Central Army Registry website. PA personnel ensure the training audience receives the latest PA guidance, policies, and procedures regarding media interaction. This equips the training audience with the most current themes, messages, narratives, and talking points.

4-14. Some important topics to cover in the PA training include the following:

- Role of Army PA and the PAO.
- Responsibilities, types, and characteristics of the media.
- Tactics, techniques, and procedures to communicate with the media.
- PA guidance, policy, and OPSEC to prepare for interview.
- Use of relevant messages, talking points, and effective responses to conduct the interview.
- Communication through social media networks.

Regardless of the training method, instructors and trainers ensure the audience hears and understands the covered training. Instructors and trainers remove distractions and discourage cross conversation so trainees can hear the briefings. They facilitate audience practice of the material covered. Practice allows for immediate reflection and feedback, on the spot improvements, and assessment of time required.

CONDUCTING TRAINING

4-15. Instructors and trainers properly develop, prepare, and resource training tailored to the training audience. The training then better provides increased capability for Army PA to tell the Army story to international and national publics.

4-16. PA trainers answer questions, provide examples, and demonstrate what right looks like. Knowledge of references and resources supports the credibility of the training professional. PA professionals require patience and must remember that many personnel in any given training audience may have never received any media interaction training or had any experience speaking in public. This knowledge requires the trainer not just to instruct, but also to coach, mentor, and encourage.

4-17. Training events always require feedback upon completion. PA trainers seek improvement through queries from the audience and leaders receiving the training. Questions regarding relevance, clarity, and presentation method of topics, examples, and exercises are important to answer. Assessment of the training event helps ensure proper use and planning of time at training events. Training performed too quickly or that runs unnecessarily long can demotivate a training audience or diminish the effectiveness of the training. Instructors and trainers evaluate feedback to determine what portions to keep, to refine, to add, or to eliminate.

TRAINING SPOKESPERSONS

4-18. Media interaction training often consists of preparing a specific spokesperson to address the media or conduct an interview with a news media representative. The spokesperson requires personal media training and attention to be prepared to deliver the most accurate and timely information to the public. An Army spokesperson represents the Army, their unit or organization, profession, and even the United States. PA staff carefully plan and consider the preparation of spokespersons to ensure the information provided on the record is correct, lawful, and represents Army Values. The task of preparing a spokesperson may come with very short notice or as part of a communication plan. Once determined it is appropriate to conduct an interview, a commander needs to identify an appropriate spokesperson.

4-19. PA staff facilitates and supports the spokesperson and media interaction. The PA staff do not interfere with the media interaction. A media interaction is the Army's chance to tell the story accurately and effectively. Support to the spokesperson begins with the initial query and ends with assessment and evaluation of the media interaction. PA leaders provide positive support to the spokesperson, even when an event occurs that interrupts the process. Both the PAO and spokesperson remain calm and in control. Expect the spokesperson to have some anxiety regarding the media interaction. Through proper planning and preparation, the media interaction can achieve communication objectives and inform key publics.

SELECTING A SPOKESPERSON

4-20. Speaking to the public through the media requires commanders to select representatives who are best suited for the role of a spokesperson and trainer for preparing a spokesperson. Commanders are spokespersons for their command, but other individuals may be required to speak on various topics or areas of expertise. The commander, staff, and PA leader work together to determine the right person to be a

spokesperson. PA leaders are the most informed regarding requirements for successful media interactions and the spokesperson.

4-21. PA leaders ensure that individuals selected have the necessary training, skills, and experience to prepare spokespersons ranging from Army Family members to the most senior officers, NCOs, and civilians employees. Consideration of existing professional relationships, appropriate rank, interview subject matter, and abilities are some factors necessary to determine the right spokesperson.

4-22. Spokespersons sometimes need to have in-depth knowledge of a particular topic, which requires identification of a subject matter expert (SME) in the command. Public perspective may lead to the appropriate spokesperson being someone who either is actively involved in the issue or has studied it at length. See table 4-2 for selecting a SME once PA personnel identify the focus of the engagement.

Table 4-2. Spokesperson selection

<i>Focus Type</i>	<i>Information</i>	<i>Spokesperson</i>
Strategic focus	Issues that require a big-picture focus on a topic.	Commanders or senior officials who can discuss the issue at that level.
Technical or tactical focus	Issues that require a more narrow focus on a topic.	People closest to the topic, such as the ones doing the actual work and have the resident expertise on the topic.
Human interest	Any great news or feature story has human interest and emotion at its core.	The men and women in uniform and their families.

4-23. PA professionals help determine the narrowed focus, potential SME candidates, and an understanding of the SME topics. Then they help commanders identify the most effective spokesperson for the media interview or engagement. The following characteristics may help identify the best SME:

- Has the appropriate level of knowledge regarding the topic.
- Understands overall objectives and commander's communication strategy.
- Possesses the ability to tell the story within context.
- Holds confidence of leadership.
- Desires to do the interview.
- Is an effective presenter.

4-24. Effective preparation of a spokesperson requires a PA professional's respectful candor and expertise, especially during assessing and evaluating the spokesperson's strengths and weaknesses through the training and preparation session. Failure to identify a spokesperson's deficiencies during a personal training and preparation session may lead to substandard performance by that spokesperson during a real-world media engagement. A poorly advised spokesperson could compromise the credibility of the Army and the individuals involved.

4-25. Effective crisis communication always requires a competent spokesperson trained and ready when a crisis happens. Because of this, commanders designate the command spokesperson well before any sort of crisis develops.

SPOKESPERSON PREPARATION

4-26. Preparing a command spokesperson for a successful media engagement requires several steps. The PAO determines the experience level of the selected spokesperson to determine the needed preparation.

4-27. PA leaders present relevant information, cover necessary details regarding the media interaction, and answer questions or concerns the spokesperson may have. A PA leader can use a message map as a guide for discussion. (See Appendix G for message maps.) A message map helps leverage key messages and talking points while tying in facts, stories, and context. PA personnel explain answer why a recommended effective response to a question is most effective and appropriate. See table 4-3 on page 4-6 for considerations PA personnel apply during spokesperson preparation.

Table 4-3. Considerations for spokesperson preparation

Consideration	Reason
Identify communication objectives to accomplish with interview	The commander desires to communicate to key audiences and send key themes and messages through the media. Think of this in terms of the information desired in an article resulting from the interview. Understanding the communication objectives helps the spokesperson craft and articulate appropriate responses during an interview.
Provide information regarding the news outlet and the news media representative to the spokesperson	Providing baseline information helps the spokesperson break the ice during initial meeting. A news organization synopsis, the reporter's professional biography, and the reporter's recent news pieces usually suffice. This information also helps the spokesperson to anticipate possible questions that the media representative will ask. Supplying this information at least one day prior to the preparation session gives the spokesperson more time to synthesize it.
Review the media kit	The spokesperson needs knowledge of and copies of materials that the media representative received. A media kit provides the reporter information and facts about the unit, relevant topics, and spokesperson, all of which the spokesperson should expect questions on during the actual interview. (See paragraph 6-9 for more on media kits.)
Provide approved talking points and messages to the spokesperson	The spokesperson requires effective responses and response techniques to answer anticipated questions using approved messages and talking points. The spokesperson must fully understand the talking points and messages.
Review the Do's and Don'ts during an interview	The spokesperson reviews security, accuracy, policy, and propriety topics to help provide the necessary response without compromising operations security, misinforming, speculating, violating established policies, or speaking on inappropriate matters.
Complete a message map	Commanders and their designated spokespeople use message mapping to help connect with audiences on key topics. These maps use a variety of approved, relevant, command-focused messages.
Ensure the spokesperson understands the ground rules	The spokesperson understands the ground rules that clarify the left and right limits of the media representative or media organization during the interview or engagement. The spokesperson recognizes and reacts accordingly when the media or the media representative violates any ground rules. The PAO present during the interview normally interjects on behalf of the spokesperson to keep the interview on course.
Provide spokesperson an opportunity to rehearse	Rehearsal helps the spokesperson gain a higher level of confidence. Rehearsal can reveal unforeseen problems and issues regardless of the topic, type of media engagement, and spokesperson's experience. A technique such as role-playing effectively provides rehearsals that help identify issues, mispronunciations, body language, eye contact, and technical difficulties to correct before the media interaction.
Provide feedback to the spokesperson.	The feedback should be in the form of an after action review. Pre-interview and post-interview feedback is essential in assessing the effectiveness of the training and the spokesperson's performance. This feedback should be candid and professional.

4-28. Appendix F contains various media training product templates for use in unit media training. Appendix G contains message mapping techniques and media facilitation guidelines for preparing command spokespeople or SMEs for media engagements.

MEDIA ENGAGEMENT TRAINING

4-29. Effective media engagement training encompasses the entire media engagement process of planning, preparation, and evaluation. The training facilitates the commander and PA staff in identifying any actual and potential issues before an actual engagement occurs.

4-30. PA staffs ensure spokespersons are equipped well before media engagements with proper training and pre-interview preparation. Expecting a spokesperson to execute a media interview well with little or no preparation is unreasonable. See table 4-4 for factors to consider for media engagement training.

Table 4-4. Considerations for media engagement training

Factor	Reason
Date, time, and location	Plan training well in advance of any expected media engagement. Conduct the pre-interview in the exact or similar location where the interview will occur. This ensures the environment is suitable for the engagement and gives the spokesperson time to get accustomed to the surroundings.
Media interview type	Tailor media engagements for print media, television or film interviews, live television interviews (livestreaming interviews), or radio interviews. Anticipate and plan for large media engagements to include a combination of interview types.
Preparation	Gather facts, review public affairs guidance, collect background information, and develop a media kit with key information related to the interview subject matter.

SOCIAL MEDIA TRAINING

4-31. The use of social media has its inherent risks; therefore, it is important for commanders to understand these risks as well as the power and benefits associated with using social media platforms. Effective social media training reinforces a climate where members of the Army including Soldiers, DA Civilians, contractors, and family members understand that online misconduct is inconsistent with Army Values. This training emphasizes preventing, reporting, and addressing online-related incidents at the lowest possible level. Social media training is one tactic to mitigate the risks of social media use.

4-32. PA guidance, policies, and training resources for social media training occurs in all three training domains. PA professionals and unit leaders can reference the Army Social Media website (<https://www.army.mil/socialmedia/>) for information regarding policies and guidance regarding the proper use of social media as well as education and training resources. It also provides content on social media best practices and up to date trends.

UNIT PUBLIC AFFAIRS REPRESENTATIVE TRAINING

4-33. UPARs represent their units for PA functions. UPAR duty provides additional developmental opportunities and training to motivated individuals desiring to tell the story of their unit, organization, and the Army. UPAR selection and training increases the higher echelon PA leader's capability to communicate for the commander. UPAR products are subject to normal editing and PA release procedures. UPARs must receive training outlining their required PA duties and responsibilities.

4-34. UPARs gain and develop basic PA skills through traditional training methods and may gain additional skills from working with PA professionals in their units and organizations. The course prepares enlisted Soldiers and officers with the training required to serve as a UPAR. At a minimum, UPARs receive training on the following:

- The official release authority.
- Basic news writing (5W's and How).
- Basic photography.
- Media facilitation:
 - Monitoring and facilitating media embeds.
 - Coordinating media engagements through a higher echelon PA office.

Chapter 5

Public Affairs Planning

PUBLIC AFFAIRS PLANNING IN THE OPERATIONS PROCESS

5-1. PA planners focus on communication-related activities that occur in the information environment. Planning is a major activity of command and control. PA is involved in planning, providing critical input with G-2, MISO, and IO offices, to ensure mutual support and consideration that may be provided to the commander's critical information requirements (CCIRs) for the commander's approval. Small PA sections, such as the brigade, require planning support by the higher headquarters or public affairs unit augmentation. PA staffs are actively integrated in each step of the operations process.

5-2. PA leaders must understand that while planning may start as an iteration of the operations process, it continues upon completion of the initial order and as leaders revise the plan based on changing circumstances. PA staffs remain involved in planning from the beginning. This includes participation in the targeting process. PA leaders and staff must observe the broad spectrum of PA connections. PA terrain is extensive and should be involved in planning.

5-3. PA operations require continuous and collaborative planning. PA planning is followed by the preparing, executing, and assessing activities. Developing a synchronized, cohesive, and comprehensive PA plan is vital in implementing the commander's communication strategy. The communication synchronization approach fulfills adaptive planning and execution requirements and describes how the commander and staff will coordinate and synchronize themes, messages, images, operations, and actions to the lowest level to support joint force commander objectives. (See JDN 2-13.) PA planners articulate and synchronize the plan throughout the MDMP. The PA plan provides a detailed overview of PA activities and associated support requirements from across the staff and subordinate units. PA planners incorporate VI capabilities, including COMCAM, during planning activities. See JP 3-61 for more information on VI.

5-4. PA leaders employ a mix of three methodologies for planning:

- Troop leading procedures.
- Army design methodology.
- Military decision-making process.

See discussions of planning and the operations process in ADP 5-0.

PRINCIPLES OF THE OPERATIONS PROCESS

5-5. PA professionals must understand the principles of the operations process:

- Drive the operations process.
- Build and maintain situational understanding.
- Apply critical and creative thinking.

COMMANDER DRIVEN

5-6. Commanders drive the operations process through understanding, visualizing, describing, directing, leading, and assessing operations. The *commander's visualization* is the mental process of developing situational understanding, determining a desired end state, and envisioning an operational approach by which the force will achieve that end state (ADP 6-0).

5-7. Communication of the commander's visualization across the staff facilitates shared understanding and purpose and aids course of action development during planning. Commanders express their visualization through the following:

- Commander's intent.
- Commander's planning guidance.
- CCIRs.
- Essential elements of friendly information.

5-8. PA leaders must understand the commander's intent. Chapter 2 explains that the PA leader must have unfettered and timely access to the commander. It is through this access that Soldiers gain the commander's intent directly from the commander. By receiving and fully understanding the commander's intent, PA staffs can develop PA courses of action and take appropriate initiative when unforeseen opportunities arise.

5-9. The commander's planning guidance broadly describes when, where, and how the commander intends to employ combat power to accomplish the mission within the higher commander's intent. PA leaders and staffs use this planning guidance to develop flexible and effective options. PA leaders and staffs must also provide concise and accurate input to the commander to help modify plans throughout the planning process.

5-10. Identification of CCIRs focus information collection on the relevant information required to make critical decisions throughout the conduct of operations. The two components of CCIRs are friendly force information requirements and priority intelligence requirements. PA leaders play a critical role in identifying CCIRs in the information environment. PA leaders play a critical role in identifying CCIRs in the information environment, as they are trained to recognize OPSEC. PA leaders continuously assess information environments for elements that pertain to CCIRs. The PA staff submit CCIRs to the commander during the staff planning process. When approved, the commander dedicates assets to collecting the information. PA CCIRs should identify and support assessments on items in the information environment that will directly aid the commanders' understanding of the impact of tactical and operational activities on the mission objectives. CCIRs can include physical activities of friends, allies, or opposition forces as well as social media activities or opposition activities to influence publics against the commander's desired outcomes.

5-11. Essential elements of friendly information identify those elements of friendly force information that, if compromised, can jeopardize mission success. PA planning incorporates constant awareness of essential elements of friendly information in conjunction with communication planning throughout the execution of the commander's communication strategy.

SITUATIONAL UNDERSTANDING

5-12. Situational understanding is the product of applying analysis and judgment to relevant information to determine the relationships among the operational and mission variables to facilitate decision making. Throughout the operations process, PA staffs share their understanding of their particular situation and provide feedback to the higher headquarters. Several tools assist PA leaders in building situational understanding and creating a shared understanding across the command and force:

- Operational and mission variables.
- Running estimates.
- Intelligence.
- Collaboration.
- Liaison.

CRITICAL AND CREATIVE THINKING

5-13. PA planners apply critical and creative thinking throughout the operations process. This process assists in situational understanding, decision making, and directing action. Critical thinking helps PA leaders identify causes of problems, arrive at justifiable conclusions, and make good judgements. Creative thinking involves creating something new or original. Creative thinking leads to new insights, perspectives, approaches, and new ways of understanding problems and conceiving ways to solve them. (See ATP 5-0.1 for creative thinking tools and techniques.)

MILITARY DECISION-MAKING PROCESS

5-14. PA participates in all steps of the MDMP. PA planners work with the staff during mission analysis to help commanders understand the situation and develop their commander's visualization. During steps 3 and 5 of the MDMP, the PA staff provides recommendations to support the commander in selecting a course of action. After the commander makes a decision, the staff prepares the operation plan or order that reflects the commander's intent, coordinating all necessary details.

5-15. The PA staff contributes products and input throughout the MDMP. Unit and organizational planning standard operating procedures (SOPs) dictate specific requirements, templates, and products. Generally, PA planners prepare the following products as part of the MDMP and staff briefing:

- Appendix 1 (Public Affairs Running Estimate) to Annex J (Public Affairs) of the operation order.
- Commander's communication strategy.
- PA input into mission analysis.
- Proposed PA guidance.
- Proposed themes, messages, narratives, and talking points.
- Information environment assessment.
- Communication plan.
- PA input to paragraph 3 of the operation order.
- Annex J (Public Affairs) of the operation order.

5-16. The MDMP consists of a series of steps that have various inputs, a method (step) to conduct, and outputs, that lead to an increased understanding of the situation and facilitate the next step. Planners generally perform these steps sequentially; however, they may revisit several steps as they learn more about the situation before producing the plan or order. ADP 5-0 provides a detailed explanation and diagram of the seven MDMP steps, key inputs, and key outputs.

5-17. PA leaders and staffs must articulate and synchronize PA planning within the MDMP. Commanders do not develop separate communication plans. Instead, commanders develop plans with communication built in from the beginning.

STEP 1: RECEIPT OF MISSION

5-18. During the receipt of mission step of the MDMP, PA planners seek to ascertain higher headquarters PA guidance, determine the commander's intent, gather necessary tools and information required to advance planning, and begin to organize initial information to foster effective planning coordination and collaboration across the staff.

Public Affairs Key Inputs

5-19. Key PA planning inputs during this step include higher headquarters orders, PA guidance, and directed PA posture (if applicable). PA planners should also accumulate and make frequent reference to Army and joint PA doctrine, unit planning SOPs, and any other existing information relevant to the mission. Such information can include existing information environment or media assessments.

Public Affairs Key Outputs

5-20. Key PA outputs for step 1 of the MDMP include development of the initial PA running estimate and the proposed commander's communication strategy. (See paragraph 5-26 for the commander's communication strategy in step 2 of the MDMP.)

Public Affairs Running Estimate

5-21. The PA running estimate is a planning product that captures factors capable of impacting the mission. PA staff use it to comprehensively capture and present section-specific information to the commander and staff with limited time available. As a continuously evolving tool and product, the PA running estimate can differ in form and information depending on the step of the MDMP in which it is being used.

5-22. PA planners develop an initial PA running estimate early in the MDMP. As soon as possible after the receipt of a mission or guidance from a higher headquarters, PA planners seek out specifics. They determine the facts, assumptions, and constraints that may affect possible courses of action (COAs). They also help to determine any essential, specified, or implied tasks in step 2 of the MDMP specific to PA delivered in the higher headquarters orders or guidance.

5-23. PA running estimates build on initial running estimates as planning continues or once an operation commences or develops. As PA planners receive more information during mission analysis and subsequent steps of the MDMP, they incorporate it into their running estimate. PA running estimates continuously capture and present both PA-related information and planning factors as well as outline proposed PA actions capable of supporting the commander's intent.

5-24. As planning finalizes and operations commence, PA running estimates evolve. These estimates include a PA assessment intended to provide the commander and staff with an overall snapshot of the information environment. PA running estimates also include proposed and ongoing PA actions and their intended or observed effect on an overall operational area.

5-25. PA running estimates and assessments take many different forms, but present much of the same information. Unit planning SOPs should locally formalize expectations and requirements for planning products and their associated submission timelines. (See Appendix B for PA running estimate templates.)

Commander's Communication Strategy

5-26. The commander's communication strategy is essentially the commander's intent for PA. Initially PA staff develop the commander's communication strategy during the receipt of mission and mission analysis steps of the MDMP. These planners brief the strategy for approval during the mission analysis briefing.

STEP 2: MISSION ANALYSIS

5-27. During the mission analysis step of the MDMP, PA planners continue to receive and analyze higher headquarters orders and updated PA guidance. Information is organized within the PA running estimate and is capable of being shared across the staff to facilitate planning.

Public Affairs Key Inputs

5-28. Key PA planning inputs during this step continue to include higher headquarters orders and PA guidance. The mission analysis step of the MDMP tends to yield a large amount of new information about the operational area, environment, and enemy. PA planners should seek out existing information environment assessments or those assessments being updated at higher headquarters echelons or within parallel staff sections (such as intelligence and IO). PA planners work with other staff sections to both ascertain and provide available information of value for respective planning initiatives.

Public Affairs Key Outputs

5-29. Key PA outputs include an updated PA running estimate and the proposed commander's intent and commander's communication strategy. Additionally, PA planners develop recommended themes, messages, narratives, and talking points supporting the commander's communication strategy. PA staff present proposed outputs for approval at the mission analysis briefing.

STEP 3: COA DEVELOPMENT

5-30. During COA development, PA planners work with the staff to help develop proposed COAs capable of meeting the commander's intent. As different COAs begin to emerge, PA planners determine how to align and employ PA assets and capabilities within a specific COA to best support the commander's communication strategy.

5-31. Throughout COA development, the commander and staff depend upon the PA planner to help answer:

- What are the PA assets and capabilities available or needed to support this COA?
- How should available PA assets be used to support accomplishment of this COA's key tasks?

- What is the proposed task-organization and associated support requirements?
- What are the risks to the commander's communication strategy associated with this COA?
- What opportunities present themselves within the proposed COA?

Public Affairs Key Inputs

5-32. Key PA planning inputs during this step include PA running estimates and updated information environment assessments.

Public Affairs Key Outputs

5-33. Key PA outputs include a proposed concept of PA support capable of supporting the COAs that the staff and commander consider as well as an updated PA running estimate. Proposed concepts of support for PA often identify associated tasks to units and staff to support PA actions proposed in COAs. Staff need to identify and highlight these proposed tasks as early as possible in both the PA running estimate and orders to avoid surprising the staff and subordinate units.

5-34. The concept of PA support identifies how PA assets will align and operate to support the commander's communication strategy in a proposed COA. Typically, PA staff present COAs on a single page slide or document. The staff includes important and relevant information such as—

- PA assets available and their proposed task organization.
- Locations of PA assets, identified media, and key communications nodes and infrastructure.
- Key tasks supporting the commander's communication strategy.
- Identified communications risks or opportunities.

5-35. Concepts of PA support focus around a common operational picture (COP) with those of other staff sections. Frequently a map diagram contains important graphic control measures. COPs provide a single display of relevant information within a commander's area of interest and are based on common data and information shared by more than one commander. PA assets and augmentation must be annotated and incorporated into the unit COP for commander awareness and planning. Retasking is then required to support new mission sets.

5-36. Formats and methods vary regarding the presentation of proposed concepts of support for PA. Unit planning SOPs should locally formalize content, format, submission timelines, and briefing requirements for PA planning products. No single format is required when presenting proposed concepts, refer to higher headquarters PA units for a template.

STEP 4: COA ANALYSIS

5-37. During COA analysis, PA planners participate in war gaming and other analysis aimed at identifying difficulties or coordination problems associated with various proposed COAs and what effect they may have on the overall operation. In identifying and considering the possible effects of a proposed commander's communication strategy within a specific COA, PA planners seek out all available sources of information and historical assessment.

5-38. Throughout step 4's COA analysis, the commander and staff depend upon the PA planner to help answer:

- How will identified key publics perceive the COA's proposed actions?
- How will critical or adversarial media spin the results of the COA's proposed actions?
- What overall impact will the COA's proposed actions have on the information environment?
- What opportunities could emerge as a result of the proposed COA?
- What are the residual risks associated with the proposed COA?

Public Affairs Key Inputs

5-39. Key PA planning inputs during this step include the proposed concept of PA support for all COAs being considered as well as an updated PA running estimate. During COA analysis PA planners gather and analyze as much information about the current information environment as possible, to include on-ground media elements and target audience in the operational area.

Public Affairs Key Outputs

5-40. Key PA outputs include refined concept of PA support that reflect and incorporate what was learned during war gaming and analysis. PA planners also leave COA analysis with criteria they will use to assess the effectiveness of the commander's communication strategy. The last output PA planners have is an updated PA running estimate.

STEP 5: COA COMPARISON

5-41. During COA comparison, PA planners work with the staff to evaluate proposed COAs independently of each other and against set evaluation criteria approved by the commander. Step 5 aims to identify the strengths and weaknesses of proposed COAs, weight them accordingly, and recommend a sole COA most likely to accomplish the commander's intent.

5-42. Throughout the COA comparison, the commander and staff depend upon the PA planner to help answer:

- Which proposed COA best facilitates the commander's communication strategy?
- What are the assessment criteria used to measure the effectiveness of the commander's communication strategy?

Public Affairs Key Inputs

5-43. Key PA planning inputs during this step include a refined concept of PA support for each COA under consideration. Another input for step 5 is an updated PA running estimate. Lastly, PA planners clearly define assessment criteria for each COA's ability to facilitate the commander's communication strategy.

Public Affairs Key Outputs

5-44. Key PA outputs for COA comparison include a recommended concept of PA support that aligns with the staff's recommended COA. Additionally, PA planners produce an updated PA running estimate focusing on the recommended COA and its associated concept of PA support.

STEP 6: COA APPROVAL

5-45. At the COA approval step of the MDMP, the commander reviews the staff's evaluations of proposed COAs, the proposed COA, and ultimately selects and approves a COA. During this step, PA planners advise the commander of the proposed concept of PA support in each COA and their methods of assessing each COA's ability to facilitate the commander's communication strategy.

5-46. Throughout this step, the commander and staff depend upon the PA planner to help answer the following:

- What are the advantages and disadvantages of each COA at implementing the commander's communication strategy?
- Which proposed COA best facilitates the commander's communication strategy?
- What is the proposed concept of PA support for the recommended COA?

Public Affairs Key Inputs

5-47. Key PA planning inputs during this step include refined concepts of PA support for each COA under consideration as well as an updated PA running estimate. The PA planner stands prepared to present in detail the concept of PA support associated with the staff's recommended COA to the commander.

Public Affairs Key Outputs

5-48. Key PA outputs following COA approval include the approved concept of PA support that aligns with the commander's selected COA. An updated PA running estimate is produced capturing information intended as Appendix 1 (Public Affairs Running Estimate) to Annex J (Public Affairs) in the upcoming operation order. Lastly, the PA key outputs include a refined commander's communication strategy.

STEP 7: ORDERS PRODUCTION, DISSEMINATION, AND TRANSITION

5-49. During the final step of the MDMP, the staff prepares the order reflecting and directing implementation of the commander's selected COA. During this step, PA planners write the plan for implementing the concept of PA support aligned with the selected COA, ensuring inputs are included in the base operation order. Unit PAO ensures vertical and horizontal PAO coordination and sharing with higher, lower, left, and right of supporting and supported PA units. Often, this is done outside the operations process.

Public Affairs Key Inputs

5-50. Key PA planning inputs during this step include the approved concept of PA support and an updated PA running estimate.

Public Affairs Key Outputs

5-51. Primary PA outputs include Annex J (Public Affairs) and both associated appendices. Unit planning SOPs dictate required PA appendices, either Appendix 1, Public Affairs Running Estimate, or Appendix 2, Public Affairs Guidance. Frequent inclusions to these appendices are public affairs guidance (PAG); proposed public affairs guidance (PPAG); themes, messages, narratives, and talking points; and individual Soldier media cards intended for large-scale reproduction and distribution.

5-52. PA planners also develop a detailed communication strategy assessment. Annex J (Public Affairs) and the operation order without the annex do not require the communication strategy assessment. However, if input from staff sections or subordinate units is required to conduct an accurate assessment, PA planners must voice these requirements during orders production. Assessment plans include both measures of performance and measures of effectiveness relating to implementation of the commander's communication strategy.

COORDINATION AND SYNCHRONIZATION

5-53. The PAO is the primary coordinator of public information and often has responsibility to lead synchronization efforts with IRCs. Throughout planning, staffs meet and conduct mission analysis, develop or update running estimates, provide input to the planning process, and develop respective sections of the operation plan or order. PA planning requires coordination and synchronization of public information and events. PA staff integrate public communication into operational planning while coordinating and synchronizing communication efforts with other IRCs such as IO, MISO, and civil affairs as part of the IO working group. PA and IO have effects that overlap in the IO working group, which require coordination and synchronization with IRCs. Lines of effort relationships always require coordination and synchronization during planning and execution.

5-54. PA staff remain aware of communication implications during operations. Communication occurs with actions, words, and images while Soldiers execute an operation. During planning and execution, PA personnel consider the impact that actions, words, and images have on stakeholders. PA personnel also identify and plan for legal and operational risks. PA staff endeavor to ensure information and communication is consistent and credible.

5-55. PA staff coordinates with logistics and communications staff to ensure resources are available for PA support during operations. PA staff include coordination and support requirements between PA activities at higher and lower level headquarters in planning. This staff considers the necessary support requirements throughout the organization, including those without organic PA assets. PA and VI coordination and synchronization during the planning process helps to identify VI requirements. (Reference JP 3-61 for more information on VI.)

5-56. Coordination of PA tasks with staff sections and subordinate units is essential. PA personnel coordinate directly when possible. Proper coordination de-conflicts staff efforts and identifies the PA force requirements for the operation. A properly coordinated plan provides the commander and staff a comprehensive understanding of how PA supports operations.

THE ARMY COMMUNICATION SYNCHRONIZATION PROCESS

5-57. The Army communication synchronization is a process to coordinate and synchronize narratives, themes, messages, images, operations, and actions to ensure their integrity and consistency to the lowest tactical level across all relevant communication activities. PAOs conduct and normally lead the Army communication synchronization process. PAOs can adapt this process to meet the needs and systems of the Army while maintaining the inherently joint and interagency capability of CCS. Major organizations may dedicate military PAOs to assist their leaders by preparing talking points to align with key messages (JDN 2-13).

Plan

5-58. During planning, the PAO accounts for guidance from higher headquarters including the OCPA's current planning guidance. In support of the joint planning process or the MDMP, the PAO localizes themes and messages and ensures PA operations nest in the commander's intent. As needed, the PAO integrates these themes and messages with the unit targeting cycle to synchronize with nonlethal effects and IRCs.

5-59. The PAO integrates PA tasks with unit missions. Because units often establish battle rhythm and other recurring events at echelon, the PAO actively integrates PA tasks with higher headquarters PA, community engagement, and information synchronization as necessary. Common events include regularly scheduled PA meetings at the division and corps levels. PAOs often integrate installation PA events with events at other echelons, but events may be separate.

5-60. The PAO oversees a UPAR program in accordance with AR 360-1 and establishes procedures to synchronize the UPAR's efforts with the commander's intent. The PAO develops specific synchronization procedures.

Prepare

5-61. During preparation, the PAO develops command information products, conducts rehearsals for PA operations, prepares SMEs to speak with the media, and otherwise conducts those activities that enable successful PA operations. Common rehearsals include media facilitations, media interviews, and other types of PA training that enables personnel in the unit to speak with members of the media and the American public. Common communication synchronization requirements during planning include vetting command information with SMEs, informing and refining media engagement plans with higher headquarters PA staffs and commands, and coordinating with members of the media and public for administrative and scheduling requirements.

5-62. The PAO continues to coordinate IRCs with key staff members to synchronize themes, messages, narratives, and talking points throughout the preparation. In a joint environment, the PAO also participates in multi-Service coordination. In some situations, other government agencies may have authority over information-related operations. Recognizing that authorities differ based on areas of operations and intended audiences, the PAO actively seeks and includes representatives whose participation aids the communication synchronization process.

Execute

5-63. During execution of a plan, the PAO provides current assessments across echelons to assist in synchronizing and deconflicting IRCs (FM 6-0 and FM 3-90-2). Recognizing that public narratives are not directly controllable, the PAO seeks to constantly refine themes and messages to ensure they stay relevant and effective in shaping narratives and keeping identified publics informed. The PAO additionally identifies emergent misinformation and disinformation to synchronize other IRCs and to develop awareness of how this information affects current narratives. (See Appendix A for countering misinformation and disinformation.) The PAO may recommend addressing misinformation or disinformation via counter-

messaging. Release authority is a necessary and critical component to the capability to address misinformation and disinformation responsibly and rapidly. Unambiguous release authority is a necessary and critical component to the capability to address misinformation and disinformation responsibly and rapidly.

Assess

5-64. Assessments are an ongoing process. Commanders use assessment to integrate relevant, reliable feedback into planning and execution, thus supporting their decision making regarding plan development, adaptation, and refinement, as well as adjustment of operations during execution. Assessment provides information about the current state of an operational environment, the progress of an operation, and recommendations to mitigate or overcome discrepancies between actual and predicted progress. It also reveals how specific capabilities, such as IRCs, contribute to this progress. (See JP 5-0 for details on assessment.)

5-65. In support of communication synchronization, the PAO uses public relations research tactics, techniques, and procedures to inform key staff members. Common examples of assessments in the communication synchronization process are media content analysis, digital communication and social media metrics, key performance indicators, and estimation of the total exposure of identified publics to command messaging. Ultimately, PAOs seek to confirm or deny that identified publics have been successfully informed and have retained command messaging. When shared, these metrics assist PA staffs at multiple levels of command.

ARMY COMMUNICATION SYNCHRONIZATION FUNCTIONS

5-66. Specific communication synchronization events differ by echelon. PAOs adapt to whichever systems and processes staffs implement at their respective units. However, Army communication synchronization events fit broadly in two categories: integrating functions and coordinating functions.

Integrating Functions

5-67. Integrating functions, such as commander communication synchronization working groups, are activities that grant approval for planning, or seeking to modify, guidance already approved based on new information or intent. PAOs propose themes, messages, narratives, and talking points, for command guidance and approval. PAOs additionally update the chain of command on the progress of current PA objectives. During integrating functions, PAOs seek to gain or confirm command approval in the same manner commanders seek approval for training calendars.

5-68. Generally, PAOs lead communication-focused integrating functions and serve as participants, supporters, or principal briefers on other integrated functions. Common integrating functions are XO or chief of staff briefings, decision briefings, training meetings, and battle update briefings.

Coordinating Functions

5-69. Coordinating functions are those activities that Soldiers use to develop and coordinate activities to achieve objectives. As with integrating functions, PAOs often lead communication-focused coordinating functions. For example, a PAO may lead an operational planning team in support of an upcoming major media facilitation, or may coordinate with PA staffs at different installations and commands to ensure command information is accurate. Coordinating functions also serve the important purpose of synchronizing PA staffs across echelons.

5-70. PAOs execute coordinating functions after the commander has approved communication objectives, or before the commander has approved communication objectives in a pre-decisional capacity. For example, a PAO may coordinate with other staff sections while developing COAs to ensure the COAs are feasible, suitable, distinguishable, acceptable, and complete.

5-71. Common coordinating events can reoccur regularly or just one time. Regularly scheduled events can include UPAR meetings, monthly BCT or division PA meetings, staff synchronization meetings, and email

reports. One-time events can include content operational planning teams, direct coordination with SMEs, conference calls with geographically separated members of PA staffs, and installation or corps PA meetings.

COMMUNICATION PLANNING

5-72. Communication planning is a systematic process to develop and deliver intended messages that target audiences receive and understand. It involves selecting the audience and determining an appropriate channel to reach the audience. Communication planning is driven by the commander's focus on achieving communication objectives. Communication planning is continuous and occurs not only during deployed operations but also during training events and at home station. These objectives assist by giving focus and direction to those developing strategies and tactics, provide guidance and motivation to those implementing the program, and spell out criteria for monitoring progress and assessing impact.

5-73. Communication planning uses a four-step process—research, planning, implementation, and evaluation—commonly referred to as RPIE. The PA planner examines a problem or issue and analyzes available and necessary resources to execute the plan in support of the commander's communication objective. Through research, the PA planner thoroughly examines the nuances behind a particular problem or issue, identifies affected publics and stakeholders, and accounts for the time required to complete the plan in time for effective implementation. Communication planning that minimizes data collection and analysis may result in lackluster receipt or delivery of intended messages. During the assessment and evaluation of the communication plan's execution, planners ensure receipt and delivery meet the intent. Implementation of the plan is execution of the operations in the communications plan, or, as opportunities arise to enact the commander's communication strategy.

5-74. The PA staff assists the commander in communicating information and messages about the force and operations to internal and external audiences. The commander expresses communication objectives in terms of desired effects. PA staffs develop communication plans that result in clearly specified, meaningful communication objectives that support the commander's communication strategy and contribute to mission success.

5-75. During planning, PA planners further define communication objectives. They clarify execution of the commander's communication strategy supported by PA core tasks to achieve those objectives. PA staff receive, collect, analyze, and interpret data; identify and analyze publics; and develop tailored messaging designed for effective communication.

5-76. This planning process is ongoing and requires the PA staff to evaluate continually the effectiveness of the communication plan and overall communication efforts. Evaluation involves quantitative and qualitative analysis of the information environment and effectiveness of the execution of the plans and PA operations.

5-77. Communication planning is also necessary in times of crisis. Successful commanders anticipate and plan for crises ahead of time. PAOs assist in this planning. They advise the commander on issues, crises, or emergency communication as part of PAO responsibilities.

5-78. Communication planning results in a communication plan. See Appendix E for detailed guidance on communication plan. PA staff design a communication plan within the bounds of legal authority. The plan aims to impact the knowledge, attitude, and behavior of specific audiences. Commanders can use a communication plan to—

- Raise morale, build understanding, dispel rumors, affect attitudes, or change behavior. Commanders may want to encourage publics to think, act, or feel a certain way (for example to stop smoking). This encouragement can involve appealing to feelings, self-interest, or a person's imagination.
- Prevent behaviors detrimental to the force such as intoxicated driving, abuse, or harassment. In instances such as these, PAOs develop communications focused on reinforcing the positive characteristics of a values-based organization.
- Prevent misunderstandings. Even a small misunderstanding can create large problems for an organization. PAOs can ensure good communication by putting themselves in the publics' position, paying attention to their needs, and getting to know them.

- Protect the higher command from misinformation, disinformation, and adversarial propaganda.
- Present a point of view. Often, PAOs only need to do this to influence a behavior.

CRISIS COMMUNICATION

5-79. In the event of a crisis, PA staff ensures a communication plan exists to mitigate the problem. For PA, a crisis is an event that affects an organization's long-term sustainability and reputation. It has the potential to create significantly negative media coverage. An issue is an internal or external factor with potential, at times seriously, to damage an organization's reputation if not managed well. Issues often gradually build and can become crises if not properly mitigated. A crisis communication strategy aims to establish and maintain the commander's credibility while dealing with the crisis responsibly, compassionately, transparently, and as swiftly as possible. An effective communication plan during crises will not always guarantee a positive outcome. However, communicating during crises is absolutely essential for the commander to attain the best achievable outcome. A crisis is not an opportunity to message.

CRISIS MANAGEMENT PRINCIPLES

5-80. Effective crisis management involves crisis communication. Crises can happen, and issues can develop while deployed or at home station. PA staffs must be prepared to act accordingly. Every member of the PA staff understands and implements the eleven principles of crisis management. These staff members develop an understanding of the role that PA has in managing crises.

Anticipate Possible Crises within the Command

5-81. A staff also war-games potential crises. When at home station, PA staffs identify the possible internal and external agencies involved in a crisis. The staffs rehearse all statements for the media as well as internal and external audiences. Such war-gaming is essential for crisis preparation.

5-82. PA staffs should identify the most likely crises both within the command and external in accordance with the commander's communication synchronization. Staff should prepare battle drills and responses from the PA perspective to support the commander's overall goals. Building a relationship before a crisis occurs facilitates solving the problem more easily. PA staffs work with key publics and third-party allies by building ongoing relationships, such as off-post neighbors, elected officials, business leaders, and community emergency response crews. Before a crisis occurs, PA staffs also may educate key stakeholders on potential issues to mitigate the effects of that crisis. These stakeholders might include external agencies such as FEMA, the Federal Bureau of Investigation, the Environmental Protection Agency, as well as local and regional contacts from the police, hospitals, or county.

Be Part of the Internal Response Task Force

5-83. As part of crisis management, PAOs prepare and rehearse SOPs within the internal task force. As part of this force, PAOs establish a crisis action team. The internal response force is a cross-functional team that advises the command in immediate response to an event or crisis. This team ensures coordination and synchronization of communication capabilities among all sections involved, to include the commander and relevant section leaders. PAOs also write SOPs to ensure timeliness and accuracy of any necessary actions. PAOs gather information only from highly reliable sources to get and give key facts. Efficient PAOs coordinate with the necessary offices and provide as many facts as possible, as early as possible, as long as necessary. They avoid conjecturing or using unconfirmed reports. PAOs base their reports and briefings solely on facts.

Know Target Publics

5-84. As part of crisis management, PAOs know their target publics. When a crisis arises, these are often the key communication stakeholders PAOs need to inform quickly and to the fullest extent possible. PAOs identify these groups and individuals well before a crisis. Part of crisis anticipation involves knowing how to reach these groups and individuals. PAOs identify and record such information while developing the crisis-focused communication plan. Additionally, PAOs include knowing their internal audience during a crisis. They

answer the relevant question: What do Soldiers, their Families, and stakeholders connected to the affected organization need to know during both issue reveal and once the issue becomes a crisis?

Identify the Central Spokesperson

5-85. PAOs identify the central spokesperson before a crisis occurs. A crisis requires a spokesperson who is at or near the appropriate level of command, or is the most knowledgeable (such as the SME). The public and audience often want to hear from the commander. Ideally, the commander responsible for the organization handling the crisis is articulate and receives specific media training to handle high-pressure situations. PAOs ensure whomever speaks for the organization fully understands the commander's intent themes, messages, narratives, and talking points, outlined in the approved PAG or the PPAG.

Work with Media

5-86. During crisis management, PAOs work with media and encourage them to cooperate. As a crisis develops, media attention can cause a situation to significantly impact the organization or command more than anticipated. During a crisis, PA staff remain open and accessible to the media. The media often requests information about an ongoing crisis or situation. To prevent the media or other stakeholders from developing their own narrative in the absence of facts, PAOs apply the DOD principles of information. PAOs ensure they deliver accurate information approved for release frequently and as often as possible. (See DODD 5122.05 for the DOD principles of information.)

Maintain Appearance and Tone

5-87. PAOs maintain their physical appearance and the tone they convey. Information needs of key publics change as a crisis unfolds. When PAOs understand the audience, or key publics, they better package that releasable information to ensure they deliver the right message. Depending on the situation, PAOs and command spokespeople consider applying the following tactics, tones, or messaging when delivering information:

- Practice sympathy, empathy, care, and concern.
- Commit to doing everything possible for those affected by a crisis.
- Investigate to determine the cause.
- Desire to avoid any other, or further, damage.
- Desire to ensure publics that the Army is doing everything possible to prevent a reoccurrence.
- Determine what the commander can do to avoid similar situations in the future.
- Establish hotlines for concerned citizens.
- Make information available or post it on digital media platforms at regular intervals.

Mind the Emotions and Intellect Pendulum as a Crisis Unfolds

5-88. During crisis management, PAOs address the emotions and swinging intellect as a crisis unfolds. PAOs recognize there is a time for cold, scientific facts and circumstances where publics will not hear these facts. Generally, groups of professionals can discuss issues. However, audiences in public hearings or in demonstrations tend to give in to emotions and away from facts. A commander who addresses a crisis as soon as it begins to develop often has a greater opportunity to win with intellectual arguments; that commander has more alternatives for action during the crisis.

Command the Information

5-89. The ninth crisis management principle is command the information. Sometimes a crisis unfold in unexpected ways. PAOs stay ahead of the story by maintaining follow-on press releases, statements, and ensuring responders or support network officials are available for escorted media interviews. Commanding the information involves being perceived as having nothing to hide. PAOs avoid giving publics a reason to

speculate on causes or disclosing specifics that may be part of an administrative, criminal, or safety investigation. Additionally, PAOs command the information by—

- Understanding the media’s interests.
- Staying tight organizationally, but loose tactically.
- Remaining flexible.
- Continuously re-examining options.

Develop Third-Party Allies and Alliances

5-90. During crisis management, PAOs develop third-party allies and alliances. An outside agency’s favorable perception carries more support with all publics. To manage the crisis, PAOs develop relationships with elected officials, emergency response planning councils, and assistance agencies like the local Red Cross, civilian law enforcement, and chambers of commerce well before the crisis.

Constantly Evaluate Messages and Their Feedback

5-91. The last principle involves evaluating sent messages and received feedback. PAOs keep lines of communication open after the crisis. Internally, they review what the crisis taught the commander about the effectiveness of the commander’s crisis management. Externally, PAOs have a plan to reestablish the commander’s good will with affected publics. Opinion research can tell PAOs how well the unit weathered a crisis and point the way for communication between the crises. PAOs evaluate sent messages and received feedback by—

- Watching the situation on an hourly or daily basis to include monitoring media constantly throughout the crisis.
- Maintaining contact with allies, publics, and stakeholders.
- Using surveys, personal and public meetings, or focus groups to gauge information needs and perceptions. PAOs always seek proper authorities for conducting the aforementioned tactics.

PROPOSED PUBLIC AFFAIRS GUIDANCE

5-92. *Public affairs guidance* is constraints and restraints established by proper authority regarding public communication activities (JP 3-61). It begins with the development of PPAG that recommends mission-specific guidance to support public discussion. PAG normally includes approved messages, talking points, and anticipated questions and answers used for preparing Soldiers for media engagements. PA personnel use this formal tool to shape and guide the Army’s public position on issues in response to questions (actual and anticipated) from the media.

5-93. PA personnel develop PPAG in time to coordinate and publish initial PAG with an order or before deployment if necessary. Coordinated PAG helps ensure those involved have unified voice and provides clear guidance on the authorization to release information to the media regarding the topic or issue. PAG is an internal document—Appendix 2 (Public Affairs Guidance) to Annex J (Public Affairs) of the operation order. This internal document assists leaders in units and organizations when discussing an upcoming deployment, exercise, or operation during interactions with the media and the public.

PROPOSED PUBLIC AFFAIRS GUIDANCE PREPARATION

5-94. Commanders are responsible for developing and submitting PPAG through higher headquarters for approval at the appropriate level for designated military training exercises, multinational activities, contingencies, and events that could attract U.S. national and international media interest, as determined by the first general officer in the chain of command. A PAO higher headquarters can direct for development to PPAG, or developed independent of guidance for a known exercise or event and pushed higher for approval.

5-95. PPAG development includes PAOs researching the recommended PA posture, background on the subject, contingency statements, messages, talking points, anticipated media questions and answers, community engagement guidance, and details governing the release of information and imagery to the public. PAOs can also research the timing, location, means, and other details governing the release of information

to the public for the PPAG. PAOs write PAG to conform to operations security and privacy requirements. (See appendix B and DODI 5405.03 for detailed PPAG information.)

PROPOSED PUBLIC AFFAIRS GUIDANCE COORDINATION

5-96. DOD policy requires that the Office of the Assistant to the Secretary of Defense for Public Affairs (ATSD [PA]) receives PPAG from combatant commands and others, as required, for all major operations. Upon receipt of the order, the commander, through the PAO, requests PAG from higher headquarters. PAG may be included in alert orders or operation orders. Commanders of major units direct their PAOs to prepare PPAG to forward the proposal through major commands and combatant command PA channels to the ATSD (PA). Commanders of combatant commands ensure that the staff coordinated the PPAG with appropriate organizations (such as embassies, country teams, host nation, governments, and subordinate commands) in the theater of operations whenever possible.

PUBLIC AFFAIRS ANNEX J

5-97. Based on information developed during the planning process and reflected in the PA running estimate, PA planners develop a concept of PA support to operations. This plan reinforces the strategic goals and operational objectives and provides the commander's intent for PA activities to inform identified key publics. During the orders production step of the MDMP, PA planners ensure that information critical to mission accomplishment and the commander's intent for PA is captured in the text of the base operation order. PA planners present the complete plan in Annex J (Public Affairs) in the operation order. Annex J must address all the PA related transportation, communications, billeting, equipment, and personnel resources required to support the plan. See appendix C for fundamental considerations, formats, and instructions for Annex J (Public Affairs) of the operation order.

5-98. Annex J (Public Affairs) of the operation order varies depending on the echelon and plan. It accounts for local requirements and limitations with these variations. Annex J (Public Affairs) must include the following key tasks, regardless of the supported operation:

- Coordinate frequently with operations, intelligence, legal, and foreign policy advisor staff to ensure the PAO has the latest information.
- Cover release authority for information and timing of information release.
- Include detailed procedures for all supporting commands for handling or forwarding information regarding queries, responses, interviews, and proposed news releases for clearance.
- Provide guidelines for release of imagery, which may include imagery taken by Soldiers on the battlefield, as well as guidelines for use of digital media, to include release authority for communication products.
- Include contact information to ensure subordinate units know who the release authority is and how to contact them.

5-99. Annex J (Public Affairs) dictates a unit's OPSEC review process before releasing information into the public domain as required by AR 530-1. Following this annex protects both Soldiers and commanders from unnecessary OPSEC violations. The annex directs PA personnel check the sources of information to ensure OPSEC violations do not occur during the newsgathering process. It also directs PA personnel to check for OPSEC violations when staff suspect a potential violation. The annex directs PA staff to protect information identified as too sensitive to be made public.

5-100. Annex J (Public Affairs) dictates that PA staff ensure units follow proper OPSEC measures when sending products concerning military facilities to media news organizations. If PA staff discover OPSEC violations, PAOs first request the media representative remove the sensitive information. If the media representative refuses, the PAO transmits the story or release over secure channels to the ATSD (PA) for handling. If PA staffs find violations after a news organization has published or broadcast a story, they report the violation to the accrediting command.

Chapter 6

Media Facilitation

MEDIA FACILITATION PROCESS

6-1. Media facilitation is the process of planning, preparing, executing, and assessing a media engagement. It occurs in tactical and home-station environments. Media facilitation provides assistance to civilian and military news media personnel, to include media embeds, to cover Army operations safely and effectively while speaking to Army leaders, Soldiers, and civilians. PA personnel must adhere to the DOD principles of information throughout the process. PA personnel must have access to information centers, operations centers, and adequate facilities to assist the media properly in receiving and telling the Army story.

6-2. Most media representatives strive to publish accurate, truthful, balanced stories without undermining, interfering, or misrepresenting the military, its operations, or activities. However, some stories may result in misunderstandings, errors, or criticisms. Commanders formulate and deliver accurate, timely, and culturally attuned messages to counter potential misperceptions and misunderstandings. When it comes to media facilitation, commanders also understand the impact of their actions on the publics' perceptions, attitudes, and beliefs of the media.

6-3. As a core task, media facilitation is integral to the success of the PA mission. Media facilitation enables PA personnel to identify requirements for a planned and unplanned media engagement or media event. Annex J (Public Affairs) in the operation order describes the plan for media facilitation. PA planners ensure Annex J (Public Affairs) captures detailed processes, procedures, and support requirements for traditional, nontraditional, and digital news media methods. As the information environment changes rapidly, PA staff stay prepared to support emerging technology needs and increased nontraditional media interests in Army operations and activities.

6-4. Media facilitation includes tasks such as the following:

- Assisting media representatives to enter an area of operations legally and safely.
- Registering and credentialing media representatives.
- Ensuring media representatives and SMEs understand ground rules for coverage.
- Helping the media representatives understand security policies and constraints that require their compliance if they wish to continue Army coverage.
- Arranging interviews and briefings.
- Coordinating unit visits and escorts.
- Assisting media representatives with transportation, messing, billeting, communication support, safety, and equipment.

MEDIA ENGAGEMENTS

6-5. A media engagement is a specified instance of media interaction between a spokesperson and a member of the media. PA staff can prepare an individual media engagement or a large-scale media event. Media engagements may be planned or unplanned and may include interviews, briefings, or press conferences. PAOs identify an approved spokesperson (such as an SME or the unit commander) to conduct the media engagement and provide media representatives with key information that specifically corresponds with their area of expertise.

6-6. Media engagements require the PA staff to plan for the event and coordinate with the media organization or representatives and all individuals involved. PAOs typically receive, discuss, and negotiate important information from the time that they receive the media query. Coordinating media engagement requests with higher headquarters PA staff may be necessary depending on the nature of the query. For

example, if the request is a national media query or has the potential to influence Service-level discussions, then the PA staff need to notify the higher headquarters PAOs. These PAOs often have insight on higher-level discussions and can provide sound PAG.

MEDIA ACCESS

6-7. When in an active PA posture, PA professionals take a proactive approach to media facilitation. They ensure media representatives have access to leadership and relevant information. PA staff coordinates access for media representatives while ensuring coverage does not disrupt or negatively affect operations.

6-8. Media embeds are media representatives embedded to provide coverage that helps Soldiers and the public have a complete understanding of an operation. PAOs and commanders understand that media embeds may report on an operation during this time. Commanders may have the media embed accompany them during their travels to units or to events in the area of operations. Embedding media in tactical level units, or with commanders, requires PAOs to provide media interaction training to the unit.

MEDIA KITS

6-9. PA staffs prepare and assemble media kits. Media kits are essential to proper media facilitation. When building a media kit, PA staffs ensure that they maintain OPSEC by removing any sensitive information. A media kit may contain the following items:

- A schedule of events, to include contingency arrangements.
- Strip maps, key routes, sites.
- Unit fact sheets, such as unit history or other unit specific information.
- Biographies of key personalities or keynote speakers.
- Copies of final approved keynote speeches (if possible).
- Relevant press releases, media advisories, or special events calendars.
- Relevant photos with captions.
- A video release list, containing hyperlinks or uniform resource locaters (commonly called URLs) to relevant video releases.
- Frequently asked questions.
- Army 101 information (such as command and organizational structure, rank structure, and other structures).
- PA points of contact.

6-10. While media kits are essential to media facilitation, they are also essential to spokesperson preparation. A media kit can assist a commander or designated spokesperson to prepare for an upcoming media engagement. Making sure to include responses-to-queries (RTQs) can provide the spokesperson with released information and assists in preventing inconsistent comments. Complete media kits include media representative background information, anticipated media questions, relevant key command messages and talking points, and fact sheets to help the spokesperson answer the media representative's questions. While unanticipated questions may arise, the information contained in the media kit will assist commanders or designated spokespersons develop their answers for the media engagement.

COORDINATION AND SUPPORT REQUIREMENTS

6-11. PA leaders and staffs ensure proper coordination and support from the start of planning and throughout an operation. PA staffs identify facilities capable of assisting the media in telling the Army story. PA planners identify these requirements in the PA running estimate and in Annex J (Public Affairs) in the operation order. PA staffs ensure that they identify the right Army personnel and equipment for media facilitation during planning. (For more on coordination and planning, see chapter 5.)

6-12. PA staffs make every effort to provide access, transportation, and communication capabilities to media representatives. Throughout the planning process and an operation, PA planners identify existing and projected media representatives along with their capabilities and requirements. These include information acquisition means, satellite communication capabilities, transportation needs, and language translation. PA

planners also provide an estimate of the logistics support required for embedded media such as billeting, food, security, and personal protective equipment. Transportation of media representatives must follow procedures and guidelines outlined in the operation order and DODI 5122.08.

6-13. Media escort personnel are facilitators appointed to help the news media representatives obtain accurate coverage of an operation or event. Escorts assist media representatives for the duration of their time with the unit, to include movement around the area of operations. While PA-trained personnel are the preferred escorts, they are not always available. An appointed escort receives training on interaction with media representatives, their information needs, and knowledgeable about the unit, mission, and area. Media escorts will not interfere in the reporting process unless they suspect OPSEC or ground rule violations. Ground rules clarify the left and right limits that media representatives or media organizations have during an interview or engagement. If an OPSEC or ground rule violation occurs, the media escort immediately executes the rules of media engagement prescribed by the PAO and contacts the PAO for additional guidance.

MEDIA OPERATIONS CENTER

6-14. The *media operations center* is a facility established by the commander to serve as the focal point for the interface between the military and the media during the conduct of military operations (JP 3-61). The MOC is the primary information center for media representatives. It provides commanders and PA staffs an unclassified venue to discuss operations with the media and provides journalists a place to obtain information quickly and efficiently.

6-15. PA planning answers the following when considering the establishment of a MOC:

- Does the operation require a MOC?
- Is augmentation required for MOC establishment and staffing?
- What is the MOC operational battle rhythm?
- What does the planning for a hasty MOC require?

6-16. A MOC provides the commander with PA personnel prepared to quickly provide RTQs and fulfill media facilitation requirements. The MOC provides the following benefits and functions:

- A single point of contact and information source for media within the theater.
- Briefings and enforcement of media guidelines and ground rules.
- Primary information release authority for the senior PAO.
- Coordination of news media coverage with various echelons.
- Coordination with unified action partners for each Service, agency, or country.
- Identification and communication of host nation's culturally sensitive topics to personnel in theater.
- Preparation for conducting press briefings and news conferences.
- Registration, sustainment, and movement of news media personnel.

6-17. As fully independent units, a TPASE and MPAD are currently organized, trained, and prepared to fulfill the requirement for MOC establishment and staffing. These units are designed specifically to serve as MOCs at theater, corps, or division echelons.

6-18. In most cases, MOC staffing requires augmentation either by individual PA-trained personnel or by Army PA units. Commanders can combine MPADs to form media sub-centers in forward battle areas. PA leaders may call on PA personnel from nondeployed commands and installation PA sections to augment MOC staff; however, PA leaders need to coordinate requests for individual augmentation through operational channels. PA leaders can augment with Reserve and Guard unit personnel on a voluntary basis.

MEDIA OPERATIONS CENTER ORGANIZATION

6-19. MOCs support the operational commander and are subordinate to the commander's PAO. PA Soldiers serve in all sections of the MOC. The commander coordinates with the PAO and staff to determine the MOC organization and staffing. Traditionally, a MOC has two distinct sections: a headquarters section and a media operations section.

6-20. The headquarters section includes the MOC's director, deputy director, NCO in charge, and select support staff. The MOC director and deputy work closely with and answer to the command PAO. The NCO in charge and support staff is normally task-organized to support tailored forward-deployed MOC teams or sub-MOCs. This task organization provides administrative support; coordinates lease and purchase contracting; sets up, operates, and maintains the unit's equipment; and conducts day-to-day operations of the MOC. The headquarters section is responsible for MOC communications, supply operations, vehicle maintenance, security, and other support functions as required.

6-21. The media operations section includes the PA Soldiers. The Soldiers are normally organized to support planning cells, a media facilitation section, and regional and local non-English speaking media. This organization is also responsible for media transportation, registration, badging and facilitation, as well as coordinating briefing area set-up, responses to query, and assisting in media content analysis.

6-22. When the commander establishes a MOC, PA staff adapt the organization of the MOC to the operational requirements. Commanders can also design the MOC to include a plans and operations (future and current operations) section, a media support and engagement section, command information section, monitoring and assessment section, and digital media section.

MEDIA OPERATIONS CENTER OPERATIONS

6-23. Army commanders know they will encounter media in any major operation. They typically deploy a PA unit as one of the first elements to establish the MOC. This is in anticipation of media facilitation requirements based on the following assumptions:

- Media representatives will arrive in an area of operations at the start of, and in most cases, before an operation begins without access to official information.
- Misinformation and disinformation is prevalent during operations when an established area of operations lacks an official source of military information.
- Current technologies aid in the proliferation of independent media across the area of operations, which requires a robust capability to analyze and assess the information environment.
- Media interest in noncombat operations will peak at the outset but may taper off over time. During a high-intensity conflict, media interest will remain high.

6-24. During joint operations, MOCs support and answer to the senior commander on a 24-hour basis. The unified commander usually establishes MOCs to support the news media in an area of operations. To achieve an initial operating capability, a MOC performs the following:

- Establish a "hasty media center" as the initial focal point for the news media until additional media support arrive.
- Establish communication with higher headquarters and other PA assets in theater.
- Begin to establish command structure and lines of authority.
- Request information release authority in the theater of operations.
- Begin coordinating with appropriate authority for leasing and purchasing contracts when necessary.
- Contact and begin to register news media personnel in the area.
- Begin RTQ from accredited media representatives.
- Provide media support with coordinated media access to subordinate units and with media escort as resources permit. Assist or conduct briefings and conferences.
- Coordinate media contact with units or individuals to include SME interviews.
- Prepare media kits; provide news releases, fact sheets, copies of transcripts for briefings and conferences, and copies of archived products.
- When other means are not available, help coordinate transportation (to and from interview sources), transmission of media products, and food and billeting.
- Provide limited media escort capabilities in the area. Units pre-establish standard operating procedures for MOCs for each theater of operation and for media operations in that theater.

A MOC will achieve full operational capability when it can conduct 24-hour continuous operations at full staffing with all sections and conduct all command-required functions for an indefinite period.

Accreditation versus Registration

6-25. Operations in the MOC entail accreditation and registration. Accreditation is the verification and validation that a person represents a legitimate commercial news organization (both U.S. and foreign). This means that accrediting governments or military organizations physically verify an applicant's affiliation with a specific news organization. When overseas, the host-nation government generally decides to accredit a news media organization in coordination with the combined or unified commander.

6-26. When the host nation does not require accreditation, the combined or unified commander has responsibility for this determination. Accreditation is normally performed at corps level or higher and in line with directives from Office of the ATSD (PA). (See DA Form 7674 [*Media Accreditation/Embed Application*] for more on accreditation.)

6-27. Media registration is part of the system that identifies and tracks media organizations movements and their locations in the area of operations. The information gained by registering media helps staffs in planning and conducting media logistics support and transportation, and in preparing subordinate commands for media encounters. It also helps commanders seeking to engage media regarding newsworthy events. A completed registration records correspondent names, agencies, contact information, and other relevant data. It also identifies which news media representatives or agencies have asked for military assistance and access, and which have agreed to the commander's media ground rules.

6-28. Registration procedure requires—

- The media representative to—
 - Complete the registration form.
 - Accept the media ground rules to include the hold harmless agreement and reimbursement agreement (see Appendix F for sample agreements). Both agreements will require a legal review prior to implementation.
- PA personnel to—
 - Gain a legal review of the hold harmless agreement and reimbursement agreement.
 - Provide a copy of the documentation to the media representative.
 - Verify the media representatives have required gear to accomplish their mission. Be prepared to issue personal protection gear if required using a DA Form 2062 (*Hand Receipt*).
 - Attach both agreements to the registration form and file form in the media reception log.

Media Access and Support

6-29. MOC operations ensure media access and support. Army and media representatives who have a vested interest in military activities maintain a continuous dialogue. Open and independent reporting is the principal means to cover military events. Such reporting facilitates media representatives' understanding of military events and occurrences so their coverage is accurate and timely. PA personnel normally do not interfere with media reporting unless they suspect OPSEC, command guidance, or ground rules violations.

6-30. Consistent with operational conditions, commanders support PA personnel with facilities to ensure the timely, secure, and compatible transmission of media information products. When Army support is unavailable, the media transmit their information products using their own resources.

Media Credentials

6-31. The third support that MOC operations provides is credentialing media representatives. Credentialing is a specific type of accreditation that grants journalists more access to otherwise restricted areas. Credentialing a media representative involves vetting the representative as a legitimate journalist as well as the journalist agreeing to abide to ground rules. Commanders used media credentialing to allow legitimate media access to cover military activities in the United States and in deployed operations. Units do not afford media representatives without credentials the same access as credentialed media representatives.

Commanders ensure all media representatives on their installation or in their operational area understand and have access to all information required for proper credentialing. When units encounter non-credentialed media, commanders and PAOs encourage these media representatives to register at the appropriate MOC.

6-32. The PAO or MOC director at the appropriate echelon establishes media credentialing guidelines (normally corps and above). Credentialing ensures Soldiers recognize and treat media representatives as legitimate journalists accordingly under the law of war. During joint operations, the joint force registers embedded media who then carry those identifying credentials, as appropriate, as well as Geneva Convention cards. Commanders do not provide information to non-credentialed and unregistered media representatives without guidance from the PAO or the MOC director.

6-33. Journalists seeking credentials to cover military activities must agree to ground rules tailored to the specific event or operation established by the approving commander, PAO, or MOC director. Violations of ground rules can result in suspension of credentials. During operations, the decision to suspend credentials or expel a reporter is made only with the approval of the joint force or combatant commander. In garrison or home station, the authority to suspend or expel a reporter rests with the installation senior mission commander. All journalists, registered or not, are expected to abide by established media ground rules.

6-34. The MOC staff provides credentialed media with badges that distinguish them from other civilians in the area, clearly identifies off-limits areas, and provides escorts as needed. When badging a media representative, the MOC personnel issue the media badge and log it in by control number. At a minimum, the credentialed media badge includes the following information, indicating the media has been accredited by the MOC:

- Photo of named person.
- Name of person badged.
- Issue date and expiration date.
- Agency issuing badge.
- Name of issuing authority.
- Control number.
- Signature block of approval authority.

Ground Rules

6-35. Operations in the MOC establish ground rules for media organizations and their representatives. Ground rules protect the media and Soldiers from the release of information that could threaten their security or safety. These rules are not intended to prevent the release of derogatory, embarrassing, negative, or uncomplimentary information. Ground rules align the media's interest to report on military operations in a timely manner with security and safety concerns. Media ground rules also include requirements that protect the health and welfare of the media. These rules identify places the media can go, off-limits areas, places the media can or cannot photograph, and procedures for requesting interviews.

6-36. Media ground rules include information on the process for the release of information, safety or access procedures, access to the internet if not commercially available, and constraints or limitations regarding interviews, such as the amount of time available and topics for the interview. Ground rules also include the process for unintended exposure or release of classified information. (See JP 3-61 for more information on ground rules.) The MOC provides ground rules to the media as soon as possible during the credentialing process.

6-37. In multinational operations, appropriate multinational command and staff channels develop and implement responsibilities for establishing media ground rules, credentialing media, and, if necessary, expulsion of media.

Media Pools

6-38. MOC operations monitor media pools. A media pool is a limited number of news media selected to provide content to multiple news organizations during specified activities or operations. Media pools are not the standard for reporting Army operations but can be implemented when conditions warrant or constraints exist. Pools should be as large as possible and be disbanded at the earliest opportunity—ideally within 24 to

36 hours of the conclusion of the operation. Commanders who knowingly create a media pool place additional support requirements on the organization. (See JP 3-61 for more information on media pools.)

6-39. The arrival of early-access pools does not cancel independent coverage for media representatives already in the area. Even under conditions of open coverage, media pools may be appropriate where seating is limited, at remote locations, or on ships. In such circumstances, PA planners specify what mediums—such as print, broadcast, and others—form the pool to ensure adequate scope and distribution of coverage. Media representatives determine who fills the spaces in the pool. Media pool selection includes designation of a team leader. This team leader ensures that members of the media pool meet their obligation to share information. Army PA personnel do not get involved in settling internal disputes of the media pool.

6-40. The military is responsible for transporting media pools when operationally necessary or under conditions of constrained access to an event. To ensure complete coverage of an event, commanders provide dedicated transportation if able. When commanders decide media pools are necessary, PA planning includes reimbursement from the media depending on location and availability of commercial transportation.

Media Query

6-41. MOC operations oversee answering media queries. Media queries are a request for information from the media. Upon receiving a query, PA personnel record the query, maintain query-tracking systems, and ensure they answer all questions as quickly as possible, being careful to not commit to a specific timeframe.

6-42. PA personnel only answer questions with information that is accurate and cleared for public release. (See appendix F for Privacy Act considerations.) PA staff need to scrub all RTQs free of jargon as well include explanations of any military terms.

6-43. Before PA staff release any information, the release authority must approve it. In the case of accidents, PA staffs customarily respond that the accident remains under investigation and they cannot release names. In the case of a death of a Service member, they cannot release names until 24 hours after the next of kin are notified. PA staff do not release conditions of patients. Patients' conditions are released from hospitals and may be categorized as treated and released, stable, serious or critical. (See AR 360-1 for nonreleasable information.)

6-44. A RTQ is recommended when there is a desire not to take action to generate media or public interest beyond responding to media queries. On occasion, the public affairs posture is RTQ until a certain point in the planning and execution of an operation, exercise, or event. At that time, the RTQ posture may change to active. On other occasions, the public affairs posture will remain passive for the duration or until completion of the military operation, exercise, or event.

Media Embed

6-45. Lastly, MOC operations oversee and track media embeds. Embedded media is the Army's most widely used method of civilian media coverage to tell the Army story due to the proximity to the Soldiers and the mission. Through embedded media, commanders can counter misinformation and disinformation by allowing the media access to actual events enabling their ability for to report on a firsthand account. The embedded media program aims to provide as much transparency as possible of military operations to keep the public informed. To achieve this, units strive to embed media representatives at the lowest level possible.

6-46. Once the higher headquarters clears a media representative for embedding, PA personnel begin the reception procedures as follows:

- Receive and credential all media personnel in accordance with higher headquarters and combatant command policies.
- Provide an operational overview or background information to include a media kit or approved releasable briefings that can be shared while maintaining OPSEC.
- Ensure media representatives have proper field gear and protective gear prior to hand-off to subordinate unit.
- Plan and coordinate a commander interview or greeting (if possible) before hand-off to subordinate units.
- Coordinate with respective UPAR and media escort for media hand-over.

- Provide daily media situation reports to higher PA headquarters. Upon conclusion of the media embed, provide a media after action review to the next higher level PAO.

6-47. PA personnel use the following items to construct an after action review:

- A PA log that the PAO has used to record a chronological list of actions of all PA assets used in the process.
- Audio or visual documentation of the media's interaction such as interviews or broadcast products.
- All products produced by the media representative to include newspaper articles, magazine articles, and social media posts.
- Documentation of issues encountered and lessons learned.

6-48. Embed termination occurs when the embedded media representatives indicate their intentions to end their stay with the unit. Hosting command PAOs, or UPARs, coordinate with the higher echelon PAO to transport the embedded media representative out of the area of responsibility. The credentialing organization debriefs all media departing theater on OPSEC considerations.

Chapter 7

Public Communication

PUBLIC COMMUNICATION OVERVIEW

7-1. PA is inherent in all military activities. As a key enabler, PA manages and delivers public information through public communication. In Army PA, public communication is the communication between the Army and international, national, and local publics. Through CCS, PA personnel develop plans, themes, and messages to inform audiences, deter competitors, and defeat adversaries.

7-2. Public communication is the receipt and exchange of ideas and opinions that contribute to shaping public understanding of, and discourse with the Army. The U.S. military has an obligation to communicate with its members and the U.S. public; it is in the national interest for the U.S. military to communicate with international publics. The proactive release of accurate information to domestic and international audiences puts joint operations in context, facilitates informed perceptions about military operations, undermines adversarial propaganda, and helps achieve national, strategic, and operational objectives. Effective public communication fosters a culture of engagement in which Soldiers and leaders confidently and comfortably engage various publics.

PUBLIC COMMUNICATION OBJECTIVES

7-3. Public communication includes the release of official information through news releases, public service announcements, media engagements, town halls, senior Soldier and leader engagements, and social networks. Public communication enables the commander in their obligation to keep the American people and the Army informed while deterring competitors and defeating adversaries. Public communication objectives are:

- Increase public awareness of the Army's mission, policies, and programs.
- Foster good relations with the communities the Army interacts with at home and abroad.
- Maintain the Army's reputation as a respected professional organization responsible for national security.
- Support the Army's recruiting and personnel procurement mission.
- Use information to deter competitors and defeat adversaries.

7-4. An active approach to public communication requires specific objectives, courses of action, and the identification of potential obstacles. Public communication engagements are impacted by media coverage, which heighten media facilitation efforts and communication strategies.

AUDIENCES, STAKEHOLDERS, AND KEY PUBLICS

7-5. Effective public communication requires that PA professionals properly identify the intended recipients of PA themes, messages, narratives, and talking points, while distinguishing among audiences, stakeholders, and key publics. An audience is a broad, roughly defined group based on common characteristics. It defines a population that contains relevant stakeholders. Generally, military communications to audiences are broad in scope, often indirect, and without feedback. Examples of audiences can include the following:

- The American people.
- DOD military, civilians, contractors, and family members.
- Partner nations and allied forces.
- International, host-nation, and local communities as well as adversaries.

7-6. PA planners assess the need to communicate with stakeholders based on the extent to which an operation or action may affect them. A *stakeholder* is an individual or group that is directly impacted by military operations, actions, and/or outcomes, and whose interests positively or negatively motivate them toward action (JP 3-61). A stakeholder's actions or decisions can also have an impact on military operations. Examples of stakeholders can include individuals in government, NGOs, or individuals that live outside a military base.

7-7. A stakeholder who communicates more actively with the military is a type of public. The more actively publics engage, the more PA staff prioritize public communication with them. A key public only arises out of the PA planning process. PAOs narrow down this segmented group that the Army deems it important to inform. Key publics do not form the basis of a communication approach, but rather serve as the beginning of the planning process for determining stakeholders and assessing key publics. A military force can tailor its communication to a key public. See figure 7-1 for examples of key publics.

Federal <ul style="list-style-type: none"> • Congressional representatives • Administrative assistants of Congressional Representatives and Senators • Environmental Protection Agency • FEMA • Others in charge of disaster relief State <ul style="list-style-type: none"> • Legislators/regulators • Governor • Chief aides • State environmental agency • Other appropriate state agencies Local <ul style="list-style-type: none"> • Local officials • Mayor • City manager • City council • County commissioners • Community advisory panels • Other key community leaders • Institutions (schools, hospitals) 	Internal Publics <ul style="list-style-type: none"> • Employees • On-post residents • Tenant units • Union officials • Family members • Retirees • Contractors Emergency Responders <ul style="list-style-type: none"> • Local emergency responders • Police, fire, first aid • Local emergency planning committee members • Local medical personnel • State police • Federal, state, and county hazardous materials and accident teams Media <ul style="list-style-type: none"> • Editor and publisher of newspaper • Reporter or stringer • Station manager or news director of television and radio stations • Trade publications 	Business Organizations <ul style="list-style-type: none"> • Chamber of Commerce • National and county alliance of business • Business roundtable • Professional and trade organizations Public interest groups <ul style="list-style-type: none"> • Community activists • Public interest research groups • Environmental organizations (for example, Greenpeace and Sierra Club) Civic/Service Organizations <ul style="list-style-type: none"> • Red Cross • Rotary • Local chapters of Kiwanis, Lions, League of Women Voters • Religious-based social service agencies • Little league, soccer associations Philanthropy <ul style="list-style-type: none"> • United Way • Community Foundations
---	--	--

Figure 7-1. Examples of key publics

7-8. PA planners identify organizational stakeholders to help determine particular key publics among a list of possible audiences. PA planners may identify many different key publics depending upon the particular PA objective, campaign, or initiative. For example, PA planners may identify local citizens as a possible audience to communicate information to about an upcoming large-scale deployment of Soldiers at an installation. Because of the potential economic impact of the deployment to the local community, PA planners identify local business owners as a key public.

7-9. Developed lists of key publics and issues stakeholders—individuals with vested interest—keep PA staff informed and updated about military activities. Efficient PA staff periodically update these lists. PA staffs prepare these community-based lists locally and keep them up to date. Conducting an assessment of key publics and stakeholders helps to develop the following:

- A more comprehensive crisis communication strategy.
- An assessment of the key publics' needs.
- An evaluation of the relationships between an organization and the key publics.

7-10. This assessment helps professional communicators develop outreach initiatives and determine the community's information needs. It is important, especially in a crisis, that PAOs prioritize affected publics.

This makes their job of communicating more manageable and makes the best use of time. PA staffs establish a tool, technique, or procedure to reach every segment of their identified publics.

7-11. The relationship between commanders and different audiences is integral to PA. Commanders build and sustain positive relationships with key publics. Management of public communication programs is a PA function. Outside the United States, public communication is often a coordinated effort with other IRCs. Regardless of location, public communication strategies help civic leaders and local populations understand the activities of nearby installations and units. The type of audience determines the information that commanders share.

INTERNAL AUDIENCE

7-12. Service members, contractors, DA Civilians, and their Families compose an internal audience. Commanders use command information programs as the primary means to communicate their internal audience. Service members of the internal audience include Regular Army, Army National Guard/Army National Guard of the United States, and United States Army Reserve, retirees and veterans. Commanders share information with OPSEC parameters and recognize that an informed force is a more ready, reliable, and resilient force.

DOMESTIC AUDIENCE

7-13. Commanders have an obligation to inform the American public about its military and its impact on the community. This communication increases public trust and support through active engagements. Through public communication programs, the military demonstrates it is a community partner and a responsible steward of national resources. Examples of public communication programs include news releases, public service announcements, media engagements, and social networks.

INTERNATIONAL AUDIENCE

7-14. An international audience consists of publics from allies, unified action partners, and host nations. International interest in military operations may be as high as, and sometimes higher than, U.S. media interest, especially in military operations conducted outside the continental United States. The Army coordinates and communicates with other agencies, organizations, and nations. Within the constraints of OPSEC, the DOD, Department of State, and allied and partner nations keep the international community informed about Army operations and activities. Before releasing information to international audiences, PAOs consider a host nation's culturally sensitive topics.

COMPETITORS AND ADVERSARIES

7-15. The last type of audience that concern PA staffs consists of competitors and adversaries. PA personnel distribute timely, truthful, and accurate information regarding U.S. intentions and actions. Commanders use the information to counter adversary and enemy misinformation, disinformation, and propaganda and to deter adversary and enemy actions. Volatility in the information environment requires PA and all other IRCs to synchronize their communication efforts to deter actions by adversaries.

SEGMENTING AND DIRECTED MESSAGING

7-16. It is important, especially in a crisis, to prioritize key publics. PA personnel deliver themes, messages, narratives, and talking points according to this prioritization. Prioritization of key publics requires that PA planners segment publics.

7-17. Segmentation is separating publics by demographics (who the audience is) and psychographics (how the audience thinks in terms of values, attitudes, and lifestyle) to enable more effective communication. It usually involves dividing publics into various groups according to established criteria. Members of each resulting key public have at least one factor in common with other key publics. PA personnel update their understanding of, and communications efforts to, segmented key publics continuously since the digital media updates in real time. Segmenting publics allows PAOs to plan for more targeted and effective communication. The PAO uses research and communication theory to identify and segment publics and to develop creative

communication plans and tailored outreach programs. See the vignette on segmentation for a sample segmentation message. (See JP 3-61 for more on segmenting key publics.)

7-18. Directed messaging occurs when commanders use public communication for key publics. Commanders achieve this more effective means of communication through themes, messages, narratives, and talking points directed at segmented key publics. PA personnel tailor such messages and talking points to the particular intended key public, when possible.

Segmentation

Former Commander of the Combined Arms Center Lieutenant General William B. Caldwell described this process of research-based audience segmentation when he reflected on his appearance on The Daily Show with Jon Stewart in March of 2008.

“When we were invited to share about Field Manual (FM) 3-0, Operations, on ‘The Daily Show,’ I must admit, I was less than convinced that we should do it. It was not until the Army’s chief of public affairs reminded me of Jon Stewart’s primary audience, an audience of men and women between the age of 17 and 35, the most attractive advertising demographic and, coincidentally, the same demographic as our Soldiers, He reminded me that our Soldiers more than anyone needed to understand the importance of FM 3-0, and this clearly was a golden opportunity to reach them.”

One might incorrectly assume that, upon seeing this unique appearance of a general officer on a nighttime talk show, the intent of such an engagement was to reach a broad audience of the American people. On the contrary, however, this represented the creative public affairs planning—and more specifically, the segmentation of key publics—that enabled a senior Army leader to reach an internal audience of young Soldiers through this “out of the box” medium of disseminating the message regarding changes to FM 3-0. Furthermore, a nuanced understanding of the demographics of Jon Stewart’s audience helped public affairs planners posit this engagement opportunity as an effective one to reach the intended, segmented key public.

COMMAND INFORMATION

7-19. Public communication implements command information. Command information is communication by a military organization directed to the internal audience. This audience includes Soldiers, civilians, contractors, and their family members. This information creates an awareness of the organization’s goals, informs them of significant developments affecting them and the organization, increases their effectiveness as ambassadors of the organization, and keeps them informed about what is going on in the organization. (See JP 3-61 for more information on command information.)

RESOURCES

7-20. PAOs have several resources to carry out the organization’s command information mission. These include publications and video services, the CORE platform, DVIDS, and different social and digital media, such as the American Forces Radio and Television Series (known as AFRTS) which is managed under DODM 5120.20.

Installation and Organizational Publications and Video Services

7-21. The Army uses installation and organizational publications and video services to communicate directly with the internal audience on its installations. Civilian enterprise publications, such as Army newspapers and Army funded publications, such as unit newsletters or magazines, can deliver the commander’s communication objectives, themes, and messages to this audience. Additionally, commanders may elect to use installation broadcast capabilities to disseminate information to Soldiers and families via a command television channel. PA professionals manage these various distribution means effectively and recommend to

the commander appropriate ways to communicate via each. (See AR 360-1 for additional guidelines for using these publications and services.)

CORE

7-22. Commanders use CORE as another method to communicate with people on installations. CORE is the content management platform and publishing tool provided to Army PA personnel. PA personnel use the CORE website to publish articles, upload images and documents, and create web pages for units and organizations. Units and organizations are permitted to have a CORE organization page. The Army encourages all PAOs to register for an account on CORE to publish content on the Army.mil official web page. Authorized personnel review and approve all content submitted to CORE for release in accordance with the local chain of command. The CORE website is located at <https://www.army.mil/core>.

Defense Visual Information Distribution Service

7-23. The DVIDS is a third resource used for command information. This service, under the direction of Defense Media Activity, is a network of portable satellite transmitters and network links connected to a distribution hub in Atlanta. This system enables media organizations to request products, conduct broadcast-quality interviews, and to receive images, video footage, and print stories from the DVIDS distribution hub. Service members can access the distribution hub when deployed to support a range of military operations. In terms of an organization's command information mission, DVIDS provides a digital platform for PA professionals to upload, organize, and feature their products to an internal audience.

Social and Digital Media

7-24. For an organization's command information mission, social and digital media provide a digital platform for PA professionals to share their products with an internal audience. While installation and organizational publications offer traditional ways of communicating with the command, other forms of communication have evolved. Social media and internet-based communication now provide additional, two-way communication between a military organization and its audiences. As technology and capabilities evolve, managing digital and social media becomes an essential component for communicating effectively.

7-25. All information posted on a publicly accessible website or social media platform is public information. All information published via social or digital media must comply with Army and DOD guidance for the release of information. These publications include AR 25-1, AR 25-2, AR 25-22, AR 380-5, AR 381-12, AR 530-1, DODD 1344.10, DODI 5230.29, and JP 3-13.

7-26. PA professionals must understand the effectiveness social media operations have communicating quickly and effectively with key publics. For instance, installations can use social media platforms to announce weather hazards, gate closures, or traffic issues to inform the local public near an installation. During a military operation, commanders consider all dissemination capabilities available to communicate releasable details and the role of the military in the operation. (See Chapter 9 for more on digital media management and social media.)

Additional Resources

7-27. A PAO has numerous other means available to carry out the organization's command information mission. These include the following:

- Service magazines often segmented based on a specialty such as aviation, armor, infantry, or on a Service component such as National Guard or Reserve.
- Town hall meetings where a commander can inform various members of the internal audience about operations, policies, and issues affecting them.
- Command events such as unit formations.
- Displays such as billboards or posters.

OTHER CONSIDERATIONS

7-28. Commanders have other considerations to balance when preparing command information. They consider the information they disseminate and its secondary audiences. While command information is intended to communicate internally, commanders recognize that released information in today's information environment often becomes readily available to all publics. Commanders consider potential effects of those other audiences obtaining such information.

7-29. Commanders consider other uses of command information. Command information is an excellent venue to share and promote the Army culture. Commanders can use command information to incorporate and reinforce the five essential characteristics of the Army Profession (trust, military expertise, honorable service, *esprit de corps*, and stewardship) and the Army Ethic. They can also share with Army personnel the three-certification criteria of Army professionals (competence, character, and commitment). The guidance in ADP 1 frames the characteristics and criteria for success as an Army professional.

7-30. In the event of a crisis, commanders consider the most effective methods to get information out quickly. Usually it is important to notify the internal audience first through PA professionals using command channels and social media platforms. Each PA professional can serve as a potential ambassador to deliver coherent messages and talking points from the commander to an external audience. The speed of communication across the social media landscape magnifies this ambassador effect and requires that PA professionals quickly and efficiently inform the internal audience at the outset of a crisis. (See Chapter 5 for more on crisis communication.)

COMMUNITY ENGAGEMENT

7-31. *Community engagement* is public affairs activities that support the relationship between military and civilian communities (JP 3-61). These activities involve working collaboratively with, and through, groups of people affiliated by geographic proximity or special interest to enhance the understanding and support for the Army, Soldiers, and operations.

7-32. Community engagement places special emphasis on two-way communications with identified publics and communities surrounding military installations. It recognizes that a positive rapport between the Army and its host communities is mutually beneficial, supporting the Army as an institution as well as its individual Soldiers.

7-33. During military operations, personnel may be involved in activities that engage the community. All community engagement activities support the commander's communication objectives. Senior military leaders have responsibilities to engage key leaders in their operational areas, including those from other government agencies and NGOs. PA staff assists in identifying key leaders and recommending opportunities for military engagement.

7-34. The Army relies on communities and regions surrounding its installations for direct and indirect support. Communities provide the Army access to resources needed to train and maintain readiness as well as extend support to families of mobilized or deployed Soldiers. Army Family members, who represent Army Values and ideals, serve as community ambassadors. Commanders recognize that a positive rapport between the Army and its host communities is mutually beneficial, supporting the Army as an institution as well as its individual Soldiers.

7-35. A public engagement is any interaction between a Soldier and the public. A public engagement can be planned or unplanned, can occur anywhere Soldiers are, and may have positive, neutral, or negative effects depending on circumstances of the engagement. PA professionals must be ready to support media operations and facilitation if a public engagement garners media attention.

7-36. Members of the Army National Guard and United States Army Reserve live and work in the community and are integral members of their hometowns. A public's positive relationship with a local reserve unit or an active-duty installation stems from the command. A commander considers potential implications of every installation activity, operation, or major training activity. This is especially important during crisis management, mobilization, deployment, and redeployment operations, even if the installation or reserve unit is not directly involved. A commander also considers potential implications during national events concerning politically sensitive or controversial DA or DOD issues. During such times, the information

requirements of internal and external audiences increase dramatically. Installation and reserve unit commanders and their staffs—advised, counseled, and supported by their PA elements—need to implement effective PA programs that include open, honest, accurate, complete, and timely release of information based on information needs. Further details on community engagement can be found in DODI 5410.19.

OFFICE OF THE CHIEF OF PUBLIC AFFAIRS ARMY OUTREACH DIVISION

7-37. The OCPA Outreach Division is located at the Pentagon, conducting community engagement and outreach for the Headquarters, DA. As the senior outreach arm for the OCPA, OCPA Outreach Division ensures PAOs and commanders in the field know their available resources for telling the Army story. This division also keeps them current on Army and DOD policy. OCPA Outreach executes national and regional outreach activities to communicate key themes and messages directly to the American public to maintain their trust and confidence in the United States Army. The outreach actions are often unfiltered by news media sources and use Soldiers as spokespeople. OCPA outreach consists of the headquarters section, executive communications team, and three field offices. The OCPA Outreach Division's key tasks are to—

- Execute and coordinate major community engagement campaigns and legacy events (such as Meet Your Army, Army Birthday, and Army forums, competitions, and commemorative events) and acquire specific venues to provide Army visibility with the American public.
- Support and shape movies, documentaries, television programs, and books produced by others about the Army.
- Develop resources for Army PA field offices (such as campaigns and websites) and provide resources for Army PA field offices (such as speakers, policy or legal reviews, aerial and non-aerial support approvals, responses to public queries, and field band liaisons).
- Develop and maintain relationships with audiences (such as veteran service organizations, Joint Civilian Orientation, civilian aides to the Secretary of the Army, Reserve ambassadors, talk show producers, organizations, and major sport teams)

OFFICE OF THE CHIEF OF PUBLIC AFFAIRS NORTHEAST REGIONAL OFFICE

7-38. Located in New York City, OCPA Northeast develops public support for the Army and its Soldiers through community outreach, media engagements, and support to veterans and military support organizations from Maine to Maryland. The office coordinates Army participation at events including Army Senior Leader engagements, color guards, bands, ceremonial units, aerial demonstration teams, flyovers, static displays of Army equipment, and Soldier and Family recognition. OCPA Northeast pitches Army story ideas to national-level and local-based media, places Army leaders and SMEs in appropriate media settings, provides media advisories and responses to queries, and assists with media requests to cover Army units in its area of operations (Regular Army, Guard, Reserve, and Army schools). OCPA Northeast is the approval authority for authors requesting Army assistance with book projects. The OCPA Northeast regional office coordinates requests for support for community events with Army installations and units worldwide.

OFFICE OF THE CHIEF OF PUBLIC AFFAIRS MIDWEST REGIONAL OFFICE

7-39. Located in downtown Chicago, OCPA Midwest develops public support for the Army and its Soldiers. This regional office uses community outreach, media engagements, and support to veterans and military support organizations. OCPA Midwest spans across the 16-state Midwest region that includes Arkansas, Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Tennessee, and Wisconsin. The OCPA Midwest regional office connects citizens with the Army network by serving as the principal Army PA liaison for professional sports franchises, media, and communities of interest and veterans service organizations. The OCPA Midwest regional office promotes the U.S. Army and informs its local public about various military events including Army programs, projects, information, and initiatives. The OCPA Midwest uses outreach efforts involving veterans, civic, and military-affiliated organizations as well as special events coordinating Army speakers when requested. This regional office also coordinates events for organizations, civic leaders, and communities to honor local Soldiers.

OFFICE OF THE CHIEF OF PUBLIC AFFAIRS WEST

7-40. Located in Van Nuys, California, OCPA West, also known as the Army Entertainment Office, is the Army's direct liaison to the entertainment industry. The staff at OCPA West assists major motion picture and television professionals to tell the Army story. OCPA West personnel work directly with members of the entertainment industry to ensure their project accurately portrays Soldiers and the Army. The OCPA West staff assists the entertainment industry by reviewing feature film and television scripts, providing on-site technical military assistance to filmmakers, and coordinating documentary coverage of the Army. In addition, OCPA West personnel seek opportunities to showcase the American Soldier through community outreach, media engagements, and community liaison.

OUTREACH OPPORTUNITIES

7-41. PA staff participate in community engagement through many outreach opportunities. A community engagement program consists of command-initiated actions that effectively inform civilians about the Army and maintain a viable relationship with the civilian community. Examples of official community engagement programs include partnering with organizations; using exhibits, bands, color guards, and other ceremonial units at civilian events; and hosting open houses and active installation tours. Unofficial community engagement programs may include any program that involves Soldiers interacting directly with a civilian community. Such unofficial events can include participating or supporting educational, religious, organizational, recreational, and youth programs or volunteering at a community organization. (See AR 360-1 for more information and restrictions on programs and activities for support to community events.)

7-42. A specific community engagement involves Medal of Honor recipients. Medal of Honor PA support oversees all Medal of Honor programs. The Pentagon's OCPA Outreach Division leads the communication efforts in these programs. This division coordinates all Medal of Honor communication activities in partnership with the Army G-1. Pre-ceremony, G-1 is the lead with OCPA Outreach supporting. Post-ceremony, OCPA Outreach coordinates media and outreach activities for both living active duty recipients and next-of-kin of posthumous recipients.

PARTICIPATION IN COMMUNITY EVENTS

7-43. PAOs carefully manage the commander's community engagement program. These officers research various options and means to engage with the community as well as recommend appropriate community engagement opportunities to the commander. PAOs also plan and execute community events involving command participation and then collect feedback from participants. Community events can include providing speakers, hosting tours and open houses, participating on community councils, coordinating ceremonial units for events, and attending town halls.

Speaker's Bureau

7-44. A speaker's bureau is composed of a pool of volunteer Service members prepared to speak on various topics. This bureau can effectively share the commander's messages to various segments of the local community. PA personnel prepare these Service members to speak on various topics, including their jobs, the installation and its mission, and specific issues affecting the organization and the local community. The PA staff is responsible for maintaining a ready pool of speakers, evaluating requests from local civic organizations, and coordinating speaking engagements for participating Service members.

Installation and Distinguished Visitor Tours and Open Houses

7-45. PAOs manage community events such as installation tours, distinguished visitor tours (commonly known as VIP tours), and open houses. These events help PAOs effectively maintain good relations with an element of the civilian community or the community at large. When conducted, command-sponsored civic leader tours or visits normally do not exceed seven days. (See DODI 5410.19 for guidelines on community engagement activities.) PA staff often schedule open houses to coincide with Armed Forces Day, the Army Birthday, Service branch birthdays or anniversaries that mark the history of the installation, a unit, or community events, or in support of media day. An open house provides the local community an opportunity

to interact with a military organization at the workplace or training site while informing the public of unit activities and the unit mission.

Base Community Councils

7-46. PA staff liaise with the community through informal community engagement councils to establish and maintain open communications with community officials and organizations. Communities can give councils various responsibilities. These responsibilities can include developing and promoting new ways for members of the command to participate in local community activities, capitalizing on opportunities for better relations, and resolving potential and actual areas of conflict. Community liaison can also involve recognition of private citizens, local community leaders, and citizen groups and organizations for their support of the Army by public service awards. Commanders can further such measures through membership in civic, business, and professional organizations when the goals and objectives of those organizations benefit the Army and their programs and projects are consistent with Army interests. (See AR 360-1 and DODI 5410.19 for additional guidelines in conducting community engagement activities.)

Military Band and Ceremonial Unit Performances

7-47. The band, color guard, and other ceremonial units participating in public events provide an effective way to accomplish community engagement objectives. These representatives of the Army serve as ambassadors to the civilian community and promote patriotism, interest in the Army, and awareness of Army professionalism. They play the National Anthem, post and retire the flags, demonstrate a professional image, and encourage participation with stimulating music.

Town Halls

7-48. Town hall meetings provide installation commanders with an unfiltered means of communicating ideas to internal and external audiences. This tool for conveying important information and ideas about the command cannot be underestimated and should be carefully planned and executed. PAOs incorporate effectively using social media platforms to expand the reach of such events into the surrounding community.

COMMUNITY ENGAGEMENT RESOURCES

7-49. When a community hosts an engagement and requests Army participation, PA staff help them request resources. The DOD recognizes two types of resources: those with aerial support and those without aerial support.

7-50. The Pentagon's OCPA Outreach Division determines support eligibility and processes requests for all aerial events occurring in the civilian domain. The PA staff submit a DD Form 2535 (*Request for Military Aerial Support*) for all Army aviation requests to include aerial demonstrations, static displays, and demonstration by Army command parachute teams and by the Golden Knights. That same division forwards requests for non-aerial events to the appropriate local PA offices for consideration. The PA staff submit a DD Form 2536 (*Request for Armed Forces Participation in Public Events [Non-Aviation]*) for all non-aerial requests. These include color guards, band concerts, marching units, and troop displays.

7-51. PA staffs check the event criteria for Army support. They use the following criteria to determine eligibility for Army support:

- Character and significance of the event.
- Recruiting assets that will support the event with their projected benefit.
- Expected attendance and media coverage.
- All planned military participation, to include that by other Services.
- Support will not interfere with official duties or detract from unit readiness or mission.
- Specific benefits of support and impact if OCPA does not approve support.
- Safety initiatives in place.

In addition to the criteria, ongoing public concern and governmental budgetary constraints require the Army's awareness of its shared role and a concerted effort by Army leaders to focus training resources on mission readiness. Army leaders make prudent decisions when assigning military assets to nonoperational

commitments. AR 360-1 outlines participation by Army personnel, their equipment, or both in public events in direct support of the core missions of the Army. All policies and procedures for approval of events are described under its provisions and remain in effect.

PUBLIC AFFAIRS PRODUCTS

7-52. Effective PA operations involve creating and using various products to execute the commander's communication priorities across the command information, public information, and community engagement programs. Additionally, numerous PA products help to guide the organization through the planning process.

COMMAND INFORMATION

7-53. PA operations use publications and other materials to support command information programs. Publications such as printed newspapers and magazines are products that require additional resources and are typically less effective in today's digital technological world. Commanders have the authority to establish funded newspapers when it meets two requirements. First, a valid command information mission requirement exists and second, the commander and the next higher level of command determine a newspaper as the most cost-effective means of fulfilling the command's internal communication requirement. See DODI 5120.04 for instructions regarding the use of this PA product as a communication tool. Magazines, when approved by the ASCC, ACOM, or direct reporting units in accordance with AR 360-1, can effectively inform the internal audience while providing an additional outlet for articles and photography produced by PA professionals about unit activities. Commanders can print approved magazines using appropriated funds in accordance with DODI 5120.04. Normally, only one post publication (newspaper or magazine) is authorized at an installation, command, or community. (See AR 360-1 for printing authorizations.)

7-54. Occasionally, organizations ask PA staffs to produce additional materials (such as posters, pamphlets, and other printed material) to support the commander's communications objectives with respect to the organization's internal audience. PA staffs employ standard principles of design when creating such products and, when possible, leverage the assistance of trained graphic designers.

RELEASABLE INFORMATION

7-55. PA operations use releasable information through means of visual information; releases, posts, and advisories; and other products to support command information programs. The PAO or PAO representative reviews information for accuracy and professionalism in keeping with the intended audience before submitting them to appropriate contacts. PA professionals follow Associated Press and local style guidelines when producing news releases and media advisories. (See DODI 5120.04 or DODI 5120.20 for more information.)

Visual Information

7-56. PA operations use visual information to share public information. PAOs leverage all unit capabilities to tell the story of Soldier and unit activities through visual information consisting of multimedia products for radio, television, and online media. PA professionals follow the *DOD Visual Information Style Guide* for standardized guidance on writing captions and entering metadata associated with all DOD VI products. Official DOD imagery serves as an essential tool for decision makers at every level, and mission success and the protection of lives and property depend on official DOD imagery being complete, timely, and accurate. PA professionals must abide by well-established DOD policies related to the capturing, handling, and distribution of official imagery. (See the *DOD Visual Information Style Guide* at <http://www.dimoc.mil/VI-Training/DOD-VI-Style-Guide/>. See table 7-1 for stipulations.)

Table 7-1. Imagery stipulations

Type	Stipulation	Source
VIRIN Visual Identification (VI) Record Identification Number	Strategic, operational, tactical, and joint-interest imagery be centrally received, managed, and distributed as a shared asset. All such imagery shall be assigned a VIRIN.	DODI 5040.02 Enclosure 6
Vision ID Visual Information Professional Identifier	All photographers, videographers, graphic artists, photojournalists, broadcasters, public affairs and other personnel involved in the creation of official DOD imagery shall be assigned a Vision ID.	DODI 5040.02 Enclosure 7 Alteration
	Official DOD imagery shall not be altered except for specified corrections, modifications, and enhancements.	DODI 5040.02 Enclosure 10
DVIAN Defense Visual Information Activity Number	A five-character unique identifier in alpha (A) numeric (N) format, rendered as (ANNNN), assigned to approved VI activities (such as public affairs offices, public affairs detachments and support elements, combat camera units, ships, and other major commands) to validate their authority to operate and to enable unit-level attribution of VI records. Like the Vision ID, the DVIAN resides in Field 3 of the VIRIN.	DODI 5040.02 Enclosure 8
Distribution	All publically released imagery shall be expeditiously forwarded to the Defense Imagery Management Operations Center (DIMOC) through the Defense Visual Information Distribution Service (DVIDS). DVIDS serves as the single central ingestion point for all DOD cleared and released imagery. As such, DVIDS provides the military, media outlets, and the general public with access to a searchable repository of official DOD audio-visual and still imagery.	DODI 5040.02 Enclosure 5
DOD	Department of Defense	DODI Department of Defense instruction

Releases, Posts, and Advisories

7-57. PA operations use releases, posts, and advisories to share public information. PA professionals issue news releases, social media posts, and media advisories regularly to inform the public of appropriate unit activities. The PAO reviews these releases for accuracy and professionalism and submits them to appropriate contacts. PA staffs use proper grammar when producing news releases and media advisories.

Other Products

7-58. PA operations use other products to share public information. To inform an external audience properly, PA staffs create various products for public release. Staffs prepare backgrounders or fact sheets, for example, as appropriate to provide detail about a detailed or complicated subject. Such products often accompany a news release to give amplifying or background information on a particular subject for greater context.

COMMUNITY ENGAGEMENT

7-59. PA operations use command engagements to support command information programs. PA staffs engage writing speeches, penning editorials, and posting on social media platforms.

Speeches

7-60. Speeches prove an effective tool of a commander's community engagement program. Speaking engagements in the community are critical to maintaining public awareness and support for the Army. PAOs can establish a speaker's bureau to identify qualified individuals in an organization to speak to the public. AR 360-1 mandates a speaker's bureau down to the installation level. This bureau prepares selected individuals to present speeches. The PA office establishes local clearance procedures for planned speeches. (See AR 360-1 for PA and speaker's bureau.)

Editorials

7-61. Commanders can use editorials to engage the community. An editorial written for a commander's community engagement publication or a local community newspaper provides the commander an opportunity to discuss policies or address issues. Commanders can voice arguments for or against such issues. Editorials are opinion-based and persuasive in nature. An effective PAO advises the commander when an editorial is the appropriate tool to inform the public. When working with a national, regional, or local newspaper, PA professionals follow the editorial standards of the paper in terms of length, submission instructions, and other requirements.

Social Media Platforms

7-62. Unit social media provide the commander the opportunity to engage various audiences in a public forum with immediacy. An effective PAO advises commanders on what conditions they need to engage the public. (For more on social media, see Chapter 9.)

DISTRIBUTION OF COMMAND INFORMATION

7-63. PA must analyze all available mediums to succeed in telling the Army story. PA personnel should be ready to serve and take advantage of various media, both locally and at the state, national, or international levels. In conducting market analysis, the following advantages and disadvantages of the various types of media in carrying the desired message must be considered.

NEWSPAPERS

7-64. Newspapers are able to cover stories in greater depth. They are timelier than magazines or books, but not as timely as radio, TV, or digital media. However, newspapers are more permanent than radio or TV. Daily and weekly newspapers often attract habitual readers.

RADIO

7-65. Radios are sometimes the only means of communications to the public during hostilities. Its major disadvantages are its lack of visual appeal, its lack of permanence and its lack of depth, as most radio news stories are in the 20–30 second range.

TELEVISION

7-66. Television is the most widely-used platform and the medium of choice for news in America. Its disadvantages, like radio, are its lack of permanence and its lack of depth. Another disadvantage is that younger audiences are twice more likely to use digital media for news gathering than TV.

NEWS SERVICES

7-67. News services can help get a story with national or international appeal to the widest possible public. News services or wire services exist to provide the mass media with coverage local media could not afford. In effect, subscription to a news service (print, electronic, or both) gives a subscriber correspondents wherever the news service has a bureau.

PUBLICATIONS

7-68. Publications can be grouped as news (Time, Newsweek), consumer (TV Guide, Better Homes and Gardens), special interest (Stereo Review, Soldier of Fortune), and internal (Soldiers, Armor). Few publication editors want "handouts" except as possible leads for staff-written stories. Special interest publications are the exception. Many eagerly seek high-quality stories and photos.

DIGITAL MEDIA

7-69. Digital media is the most potent mass communication medium today. It offers variety, mobility, and combines TV's impact of moving pictures with the sound and immediacy of radio. Digital media is also a world-reaching medium that is accessed on a moment-to-moment basis by all types of publics. Many of the previous mediums have an outlet to the internet providing possible permanence and history for stories and information. Developing a digital media presence can often be beneficial to your unit's command information mission.

7-70. Reviewing available media, the PAO should compile a media listing. That listing should include all local media and outside media that would likely use material from the U.S. Army as well as names of editors, news directors, or station managers; addresses; phone numbers; deadlines; frequency of publication; type of public served; and unique requirements or interests. In many communities, media listings already exist and are available from state, city, or community service organizations. The Gebbie Press All-In-One Directory, the Editor and Publisher International Yearbook, and Broadcasting Annual are examples of directories that can help locate outlets nationally and worldwide.

7-71. As part of marketing, press releases and media advisories will routinely be issued. These releases must be reviewed and approved by the PAO or his or her designee. Before sending a release to any media, ensure it is accurate, professionally prepared, and of interest to the newspaper, magazine, or radio-TV stations receiving it. Also ensure releases are tailored to suit the requirements, interests, and formats of the recipients.

PUBLIC AFFAIRS REGULATIONS, LAWS, AND POLICIES

7-72. Numerous regulations, laws, and policies guide the application of effective PA operations. PA professionals must be familiar with such guidance to manage daily PA operations properly and advise the commander. The following paragraphs discuss a few basic PA publications while highlighting various important regulations, laws, and policies that inform PA conduct.

ARMY REGULATION

7-73. AR 360-1 provides guidelines for the release of command and public information, including information released to the media, and community engagement programs intended for internal and external audiences with interest in the U.S. Army. PA professionals should be familiar with the guidance within AR 360-1 when planning and executing command information, community engagement, and public information programs in garrison or while deployed.

JOINT DOCTRINE

7-74. JP 3-61 provides doctrine for the planning, execution, and assessment of PA activities in joint operations. It includes the Army fundamentals, roles, responsibilities, and relationships to joint functions and capabilities. Successful PA professionals understand and apply JP 3-61 when operating in joint and deployed environments.

DEPARTMENT OF DEFENSE ISSUANCES

7-75. Effective PA professionals know DOD-level guidance on PA operations, including the following:

- DODD 5122.05 establishes the responsibilities and functions, relationships, and authorities of the ATSD (PA).
- DODI 5400.13 establishes policy and assigns responsibilities for the conduct of PA as a primary DOD communications capability.
- DODI 5400.14 implements policy, assigns responsibilities, and prescribes procedures for the conduct of PA programs in support of joint, combined, and unilateral military operations.
- DODI 5410.19 establishes policy for the conduct of PA community relations activities and programs throughout DOD.

REGULATIONS, LAWS, AND POLICIES

7-76. Military programs are governed by federal law, DOD policies, and branch-specific regulations.

Free Flow of Information

7-77. DODD 5122.05 mandates that military organizations make available timely and accurate information so that the public, Congress, and the news media may assess and understand facts about national security and defense strategy. In carrying out the policy, the principles of information will apply. (See DODD 5122.05 for a description of the DOD principles of information.) In keeping with this policy, PA staff answers requests for information from organizations and private citizens in a timely manner in accordance with the FOIA. According to DODD 5400.07, Congress enacted FOIA to protect the American people from the government unnecessarily withholding information from them. PAOs must be familiar enough with FOIA to understand the basics of the law and to abide by its implications regarding the proper release of information. (See DODD 5400.07 for guidelines on the FOIA and the nine exemptions allowed under law.)

Law of War and Rules of Engagement

7-78. The *law of war* is that part of international law that regulates the conduct of armed force (JP 3-84). The law of war also applies to the conduct of hostilities and the protection of war victims in both international and non-international armed conflict, belligerent occupation, and the relationships among belligerent, neutral, and non-belligerent States. *Rules of engagement* are directives issued by competent military authority that delineate the circumstances and limitations under which United States forces will initiate and/or continue combat engagement with other forces encountered (JP 3-84). Rules of engagement reflect legal, policy, and operational considerations; they are consistent with the international law obligations of the United States, including the law of war. When communicating in a deployed environment, PA professionals must understand the law of war and the rules of engagement as well as their implications on U.S. military operations. (See *Department of Defense Law of War Manual* for additional guidelines.)

Host-Nation Laws

7-79. All PA staff members use host-nation laws to inform communications. PA planners consult with host-nation governments as appropriate in deployed environments. These planners identify local issues and concerns that they reflect in the PAG released to the commander and in externally released PA products. For more guidance, PA staff contact the respective host nation's embassy PAO.

Privacy Act

7-80. The Privacy Act of 1974 establishes that an individual's privacy is a fundamental legal right. AR 25-22 generally prohibits the members of the Army from publicly releasing certain items of information about an individual without that individual's consent. (See AR 360-1 for implementing privacy rights.) DODI 5400.11 mandates the protection of individual's rights, consistent with federal laws, regulations, and policies when maintaining their personally identifiable information. PA professionals must protect the privacy rights of Service members while providing publics with appropriate information about unit activities. In accordance with DODI 1300.18, PA offices cannot release casualty information on deceased personnel to the media or general public until 24 hours after notifying the next of kin regarding the casualty status of the member.

Health Insurance Portability and Accountability Act

7-81. The Health Insurance Portability and Accountability Act (known as HIPAA) of 1996, implemented by DODI 6025.18 and DODI 8580.02, generally prohibits the DA from publicly releasing certain items of information about an individual without that individual's consent. To release information about patients under treatment in Army medical facilities, PA professionals must obtain prior consent from the individual or the individual's representative. (See AR 360-1 for additional guidelines on what information is releasable once consent is obtained.)

Security Review

7-82. All official information released to the public that pertains to military matters, national security issues, or subjects of significant concern to the DOD must receive a security review by a qualified PA professional. That PA professional ensures that such information does not violate OPSEC. DOD personnel have the responsibility to ensure products have a proper security review before distributing them to the public. This applies to written products, speeches, and information released on the internet or other electronic media. Additional training and guidance is available at the Army Social Media website. (See DODI 5230.29 for additional guidelines on clearance and review of DOD information for public release.)

Accessibility

7-83. PA professionals ensure persons with disabilities can appropriately access PA products (See DODM 8400.01 for guidance on accessibility for persons with disabilities.) DODM 8400.01 addresses DOD employees or members of the public with disabilities who seek information or services from the DOD. This regulation requires PA staff to give these people access to and use of information and data comparable to the access and use by individuals without disabilities. If such access imposes an undue burden on PA staff, then the staff can limit the accessibility. (See specific details in Section 508 of the Rehabilitation Act of 1973, as codified in Section 794d of Title 29, USC.)

Chapter 8

Counter Misinformation and Disinformation

UNDERSTANDING MISINFORMATION AND DISINFORMATION

8-1. Disinformation, often characterized as propaganda, is any form of adversary communication, especially of a biased or misleading nature, designed to influence the opinions, emotions, attitudes, or behavior of any group in order to benefit the sponsor, either directly or indirectly. The traditional factors that make information about an event newsworthy are the same factors that make propaganda compelling. People are drawn to conflict or violence, and many of our adversaries have mastered the art of using it, real and contrived, to influence the audience to further their objectives and minimize the Army's effectiveness. Anticipating actions that an adversary may exploit with propaganda and limiting that potential with preemptive release of information is paramount. When operations do not allow for such actions, PA units prepare to respond quickly to counter propaganda.

DEFINITION

8-2. Misinformation is a subset of information defined simply as incorrect information. Incorrect information from any source that is disseminated through ignorance or with the belief that the incorrect information is correct, can be a result of an adversarial disinformation campaign. Information can be incorrect for numerous reasons. For the purpose of PA, incorrect information has the potential to affect the understanding that a public may have on a subject important to communication efforts.

8-3. Disinformation is incorrect or false information disseminated from an adversarial source that is designed with the intent to distort information or deceive or influence the receiver. Adversarial use of disinformation in the information environment is often to confuse or affect public opinion against a perceived enemy and benefit the sponsor of the disinformation. Some forms of adversarial disinformation are deliberately disseminated in order to benefit a sponsoring government, organization, or group, either directly or indirectly. Intelligence organizations or other covert adversaries use indirect or unconventional means to distort information to deceive or influence publics. PA staff should not expect to defeat disinformation since it is a tactic and not an adversary, but should expect to be part of the countermeasure process. PA can counter disinformation and should acknowledge the strength truth has over both disinformation and misinformation.

PUBLIC AFFAIRS REQUIREMENT

8-4. DODI 5400.13 drives the PA activities requirement. It instructs PA staffs develop and employ DOD PA activities and capabilities to support the command and to ensure the trust and confidence of U.S. population, friends and allies, deter and dissuade adversaries, and counter misinformation and disinformation ensuring effective, culturally appropriate information delivery in regional languages.

PUBLIC AFFAIRS CONSIDERATIONS

8-5. PA staffs have several factors to consider when assessing adversarial misinformation and disinformation. They first consider what makes the disinformation believable. Misinformation is not adversarial, though adversaries can have misinformation efforts as part of a disinformation campaign. The most successful conspiracies likely contain some element of truth. The traditional factors that make information about an event newsworthy are the same factors that make misinformation compelling. Publics have both concern and interest regarding conflict or violence, and the Army's adversaries have mastered the art of using it, real and contrived, to influence audiences, further their objectives, and minimize the command's effectiveness.

8-6. Second, PA staff consider the unity of effort necessary to counter disinformation. When coordinating IRCs, PA personnel ensure unity of effort in countering disinformation. Commanders consistently communicate in an integrated and coherent manner regarding the actions and intentions of the Army and their command to counter disinformation.

8-7. Speed is a third consideration when countering misinformation and disinformation. The first side that presents the information sets the context and frames the public debate. PA staffs work quickly to get accurate information and imagery out first, without rushing to failure by inadvertently releasing inaccurate or incomplete information—even information that portrays DOD in a negative manner. This speed helps disarm the adversary’s propaganda and defeats attempts by the adversary to use these mistakes against friendly forces. Credibility must be maintained. PA professionals require the knowledge, skills, resources, capabilities, and authority to release information rapidly to various publics to support the commander’s communication strategy effectively. PA disseminates information while protecting OPSEC and in accordance with DOD policy and guidance.

8-8. Lastly, PA professionals consider where to search for the adversary’s information. They analyze information in traditional, nontraditional, and social media channels in search of misinformation about the Army and its missions. Misinformation can adversely affect an operational environment and the success of operations. PA operations contribute positively to operational environments by delivering facts in the form of releasable accurate information and imagery. PA staffs recognize and pick out adversarial disinformation efforts to analyze and counter before it can negatively affect Army operations.

RECOGNIZING MISINFORMATION AND DISINFORMATION

8-9. Detecting and recognizing misinformation and disinformation proves challenging for PA personnel. Misinformation and disinformation resides in the same outlets as factual, truthful information. Adversaries understand this and often rely on the rapid dissemination of unsubstantiated information using the continuous news cycle, social and digital media platforms, and other online information sources.

8-10. PA staff audits continuously for misinformation and disinformation regardless of the environment or type of military operation. PA staff conducts communication analysis and evaluation of PA activities. Army PA staff research to detect and counter or mitigate mission-related disinformation directed at international, national, and local publics, both at home station and abroad. Knowing where to search and being able to identify the types and tactics of misinformation and disinformation is critical to counter an adversary’s malign narrative.

RESOURCES

8-11. To recognize misinformation and disinformation, PA staff require various resources. They need access to information, current technology, and IRCs. Detecting misinformation counter to planned and coordinated communication is the first step to successfully counter disinformation and correct misinformation. The commander, through coordinated communication, ensures PA staff have access to information that affects an operational area. This information can include open source reports, relevant intelligence, and known common adversary disinformation techniques.

8-12. With support from PA staff, the commander leverages available technology and personnel to detect, analyze, and respond to misinformation and disinformation. This technology gives PA staff real-time awareness of facts surrounding military operations by publics, stakeholders, and even adversaries. Technology that includes social media and broadcasting enables PA personnel to establish and own the narrative among publics and the media. An uncorrected record provides an adversary with a great deal of time to amplify the effects of false or misleading information.

8-13. Involvement in the planning process and having access to various IRCs help PA staff to detect, analyze, and decide when to release timely, truthful information and imagery intended to counter misinformation and disinformation efforts. PA staff should, at a minimum, maintain knowledge and awareness of the following resources:

- Annex J (Public Affairs) in the operation order.
- Appendix 1 (Public Affairs Running Estimate) to Annex J (Public Affairs) in the operation order.

- Communication plans.
- PAG.
- Media analysis products.
- Social media engagement.
- Media engagements.
- Higher headquarters' communication plans.
- Themes and messages to include changes from higher headquarters.
- Communication from leadership.
- SOPs.
- Intelligence products.
- Open source reports.

DISINFORMATION TACTICS AND TECHNIQUES

8-14. To recognize misinformation and disinformation, PA staff require disinformation tactics and techniques. Adversaries employ various tactics and techniques in their disinformation efforts. PA staff leverage the knowledge of other IRCs to gain a greater understanding and increase their ability to recognize disinformation.

Tactics

8-15. PA staffs study and understand several disinformation tactics:

- Forgeries.
- Front groups and friendship societies.
- Influence operations.
- Media manipulation.
- Broadcasts.

Forgeries

8-16. The first misinformation and disinformation tactic recognized by PA personnel is forgeries. Forgeries, to include falsified documents and imagery, attempt to discredit individuals, institutions, or policies so to damage the Army and its interests as well as manipulate public and government opinions. PA staffs can expose forgeries as fakes. However, such denial may never entirely offset the initial damage, which allows for repeated references to the document.

8-17. The effectiveness of a forgery often depends more on the predisposition of the recipient than on the source or quality of the forgery. A recipient who is hostile toward the Army or U.S. Government or who is eager to expose an individual or organization they have contempt for is far more likely to credit a forgery than one who is not hostile. Sophisticated journalists usually prevent publication of the forgery, and a forged document is more likely to circulate in nontraditional media or on social media platforms.

Front Groups and Friendship Societies

8-18. PA personnel recognize the tactic of front groups and friendship societies. Front groups and friendship societies normally present themselves as nongovernmental, nonpolitical organizations engaged in promoting such desirable goals as world peace, cultural understanding, philanthropy, and education. Front groups can provide an adversary with a covert vantage point from which to disseminate disinformation by providing sensational commentary to the media, provocative imagery, and persuasive funding all in the effort to influence the narrative. PA personnel recognize that fronts are an intelligence function, which falls into the realm of human intelligence and outside of PA.

Influence Operations

8-19. Another tactic that adversaries use is called influence operations. Influence operations involve individuals who openly or covertly support and promote their sponsor's interests. These individuals of

influence may come from virtually any profession. Sometimes adversaries wait until an individual achieves an influential position in government, business, academia, or media before they call on the individual to be a representative for disinformation. PA staffs recognize an influence operation is an intelligence function, particularly when looking at an individual and building a profile on them. This must be avoided by PA staff.

Media Manipulation

8-20. PA staffs recognize the misinformation and disinformation tactic called media manipulation. Media manipulation occurs when adversaries of the Army or U.S. Government place falsely attributed or non-attributed disinformation products in print, broadcast, and social media. These products, which contain misinformation, may appear in regular publications, clandestine broadcasts, or printed brochures. Broadcasts transmit through radio, television, and social media to provide misinformation to various publics. Some broadcasts are clandestine. Overt broadcasts are active in numerous nations that promote disinformation that opposes the Army's interests. PA staff recognize broadcasts of misinformation or disinformation by the manipulator committing gross negligence of facts and errors in fact.

Techniques

8-21. PA staffs study and understand several disinformation techniques used by adversaries. They have no exact formula for detecting if some specific information or allegation is false. However, they can answer certain questions to determine the credibility of the information.

8-22. PA staffs can ask if a covert but influential organization is responsible for a circumstance or event. Does the information contain fantastic claims? Does it identify powerful or destructive organizations or forces that are secretly controlling people or manipulating world events? If so, the information may be a conspiracy theory. Conspiracy theories are rarely true, but are often widely accepted and have appeal. Adversaries often target the U.S. military or intelligence community in conspiracy theories.

8-23. Another technique that PA staffs recognize involves a story circulating as truth that happened to an acquaintance with horrifying elements. Is the story startling, entertaining, bad, amazing, horrifying, or otherwise seemingly too good or too terrible to be true? If so, it may be an urban legend. Urban legends often circulate by word of mouth, email, or the internet. These stories involve false claims that an audience widely believe because they put a common fear, hope, suspicion, or other powerful emotion into story form.

8-24. PA staffs recognize a third technique that involves a shocking revelation. Does the information contain a shocking revelation about a highly controversial issue? Highly controversial issues are natural candidates for the rise of false rumors, unwarranted fears, and suspicions. The 2015 iteration of Jade Helm, the U.S. Special Operations Command exercise, is one such example. Exercise planning documents fictionally depicting certain states in the southwest United States as hostile territory leaked to the public causing the proliferation of unsubstantiated governmental conspiracy theories and garnering national attention. By the time PA personnel got involved, the issue had become a crisis. Several stakeholder organizations and PA staffs diligently worked to mitigate the effects caused by the misinformation.

8-25. PA staffs recognize the technique of using an untrustworthy source. Is the source trustworthy? Certain websites, publications, and individuals have a reputation for spreading false stories. Many websites contain a great deal of unreliable information. Extremist groups, splinter political organizations, and individuals often publish disinformation. Titles of websites can also be deceiving and can present what appear to be official or harmless descriptions to lure viewers. PA staffs look carefully at website details to determine its ownership and validity of source information. This can prove especially difficult if front groups publish false allegations. Front groups purport to be independent, nonpartisan organizations, but actually partisan political parties or interest groups often control the websites.

8-26. Lastly, PA staffs recognize and perform quality research. What does further research tell you? They research allegations. They determine whether information is true or false by researching it thoroughly. PA staffs consider time, lethality, and pressure of a prompt response or release, but there is no substitute for thorough research. These staffs can thoroughly research information using the internet, communication plans, PAG, and other resources.

COUNTERING MISINFORMATION AND DISINFORMATION

8-27. MISO help PA personnel to counter adversary information efforts of misinformation and disinformation. PA staffs work to decrease or mitigate the impact of information with timely, factual messages disseminated to selected target audiences to gain and maintain the information initiative. When PA staffs counter misinformation and disinformation, often while coordinating with other IRCs, they degrade the intended effects of misinformation and disinformation. The timely and accurate dissemination of truthful and verifiable information from credible sources exposes the misinformation. Eventually, synchronized communication can lessen or neutralize the credibility of intentional misinformation and disinformation sources. PA staffs—coordinating with other IRCs—accurately assess the information environment to determine the actual effectiveness versus the perceived effectiveness.

8-28. These staff use the following resources to counter misinformation and disinformation:

- Timeliness and deterrence.
- Synchronization with IRCs.
- Lines of effort relationships
- Communication.
- Various timeframes.

TIMELINESS AND DETERRENCE

8-29. PA personnel use timeliness and deterrence to counter adversary misinformation and disinformation efforts. Army PA personnel have an obligation to keep the American people and Army forces informed, which includes countering misinformation and disinformation directed at those publics. Adversaries can include individuals, organizations, nations, and non-nation state players attempting to influence publics with false or misleading communication.

8-30. An adversary understands that timeliness of disinformation is important in communicating to achieve influence. PA personnel cannot assume positive perceptions and attitudes from leaders, decision makers, and the public. The entity that establishes the narrative first can more easily sway perceptions and attitudes.

8-31. Effective commanders prepare to assume some risk to ensure timely execution of public communication activities. Such activities make available the most contextually accurate information to the public. If commanders hesitate to release information or acknowledge events until after they gather complete facts and circumstances, they can create a void in the disseminated information. An effective adversary can potentially fill that void with disinformation.

Chapter 9

Digital Media Management and Social Media Maintenance

DIGITAL MEDIA MANAGEMENT

9-1. *Digital media* is text, audio, and VI content that can be transmitted over the internet or computer networks. Army PA content that is released on a website, blog, or social media platform will fall into this category (AR 360-1). Digital media management is the process of communicating information across the command enterprise using an organization's digital tools—including unit websites, CORE, and social media platforms—to build an engaging online presence. Successful digital media management incorporates a digital media strategy. This strategy defines communication objectives and designs plans that leverage the appropriate digital platforms to inform, educate, and engage audiences in support of the commander's communication strategy. A digital media strategy, and the overall digital media management process, takes time and dedicated resources to develop and execute.

9-2. Digital media management aligns the commander's objectives in support of DOD strategic narratives across the entire command enterprise. Generally, garrison commands and echelons at division level and above implement a digital media strategy. PA personnel develop both long-term digital media strategies for commands and event-based strategies in pursuit of singular goals or topics. PAOs balance digital media management—either at the enterprise level or in support of the higher echelon—with daily social media maintenance.

9-3. Social media maintenance is the art of maintaining a dynamic and engaging social presence. It focuses mainly on daily social engagements at the organizational level and in support of higher echelon's digital media strategies. PA staffs maintain social media by systematically performing recurring tasks that lead to creating and posting various types of content. Social media maintenance has no defined start or finish. A digital media strategy has a defined goal or goals with measurable outcomes—or return-on-investment—that supports the commander's intent. PA personnel assess digital media strategies by the successful or unsuccessful completion of defined goals. To complete these goals, PA staffs ensure strategies have defined timelines, allocate resources deliberately, and digitally integrate the command enterprise.

9-4. In the development process, PA personnel consider ways that digital media strategies support or complement larger Army initiatives. PA personnel factor the tie-in to the Army's organizational values and commander's vision. Effective digital media strategies define a purpose and an outcome. Rather than technology centric, digital media management is relationship centric (two-way communication), which requires consistent follow up with audience engagement and synchronization within the command.

COMPONENTS OF A DIGITAL MEDIA STRATEGY

9-5. PA staffs develop a digital engagement strategy with a defined goal or objective if the topic or goal is of great enough importance or has command emphasis. The goal is a one-sentence statement to solve a core problem or seize an opportunity. Often this sentence states the desired outcome to meet a challenge. The statement does not have to be in quantifiable terms. For example, the strategy could be "Decrease the number of drivers stopped for driving under the influence or DUI." The goal of a digital media strategy is typically a broad one. PA staffs tailor the strategy to changing knowledge, attitudes, or behavior. It simply answers the question: What do we want to happen? To develop the strategy, PA staffs perform eight tasks.

RESEARCH BACKGROUND

9-6. Once PA staffs identify a goal for a digital media strategy, they conduct background research on the topic. When conducting background research, they consider three types of research: primary, secondary, and general topic.

9-7. Primary research is information gathered firsthand by the PA staff member with social media management tasks. A social media manager is a PA member who has completed OPSEC Level II and has received all necessary training to publish on social media on behalf of the commander and the unit. PA staffs can collect information in many forms including surveys, focus groups, and personal interviews or studying trends on the unit's social media sites.

9-8. Secondary research is conducted by using pre-existing research found in online databases. This can include scholarly journals, census, and newspapers as well as demographic information found in studies conducted by the base safety office.

9-9. At a minimum, PA Soldiers conduct general topic research in support of communication goals. For example, the commander may have a goal to decrease the number of DUIs. In this case, Soldiers research the number of DUIs in the command during a specified period, hours of work lost due to DUI infractions, financial impacts on Soldiers, career impacts on Soldiers, applicable regulations, and Army guidance. Such extensive research is essential to developing a coherent strategy. When planning to conduct research, PA staffs consider:

- Time constraints.
- Personnel available to conduct the research.
- Commander's intent (speed at which PA staffs must post the topic or content).
- Knowledge about the topic.
- Existing information about the topic.
- Legal issues (when the topic concerns legal or law issues).

CONDUCT ANALYSIS OF BACKGROUND RESEARCH

9-10. Once PA staffs gather all necessary background research, they analyze the research. The analysis should include assessments of social media trends, audiences, and agendas. It should also include identifying gaps in knowledge or capabilities as well as identifying available and emerging platforms, formats, and best practices. Some analysis will include determining the current social media climate. Effective analysis involves analyzing narratives, counter-narratives, other communication trends and tactics, techniques, and procedures. Analyzing the background research also includes selecting tactics, techniques, and procedures from the analysis in support of social media strategy. Lastly, this analysis includes forecasting future effects of current conversations, engagements, and trends. When PA staffs conduct background research, they also perform a digital media audit.

CONDUCT DIGITAL MEDIA AUDIT

9-11. During a digital media audit, PA staffs focus on the organization's internal products as well as external social media platforms. The audit can be a general audit, or specific to the goal of the digital media strategy. An internal audit focuses on organizational communication tools and determines those tools that already support the goal. Some examples of products to review include the following:

- Organization social media platforms.
- Command information products.
- Official emails.
- Press releases.
- All other communication products.

An external audit focuses on other organizations' methods to reach the particular goal of the digital media strategy. An external audit can include other Army organizations as well as external organizations. For example, Mothers Against Drunk Driving has a social media presence that addresses the DUI topic.

9-12. Part of auditing digital media includes looking at existing communication tools. Some communication tools might already focus on reaching a specific audience. For example, PA staffs might use social media to reach external audiences and use emails to reach internal audiences. PA staffs identify which communication tool best reaches which audience. The resulting information helps PA staffs determine the best engagement plan in support of the social media strategy. For each social media platform, they answer the following questions:

- Who (what audience) is using the platform?
- How many people follow the communication platform?
- What are the demographics of the audience for each platform?
- How is each platform currently being used?
- What key messages are currently used on each platform? (This can help shape messaging later in the plan.)
- Is the tone usually serious or light-hearted? (Sudden jokes on a serious platform may damage the message being transmitted.)
- What other stakeholders have interest or are related to the topic?
- What messages are other stakeholders posting about the topic?

9-13. If surveys, analytics, or anecdotal data indicate most users of a particular social media platform are outside the internal audience, a different platform may work better to reach the internal audience. The opposite can be applied to email when trying to reach an external audience. If a particular social media site only has a few followers, PA staffs may not find it useful to use unless the followers are a key audience. Ideally, PA staffs organize the results of a social media audit into a table.

DEFINE OBJECTIVES

9-14. Objectives aim to align efforts, increase transparency, and develop manageable, adaptable, and measurable courses of actions in support of a digital media strategy. PA staffs do not define objectives to identify shortcomings, but more to look at the factors that contributed towards success or failure. While developing objectives, PA staffs annotate the objective, its alignment or support for a competency, and its metric or key result. Most goals have three supporting objectives. The best-formulated objectives result as measurable outcomes. There are often multiple objectives in support of a single goal.

DEFINE KEY RESULTS

9-15. A key result is a milestone. Objectives are directional and tell organizations where to go. PA staffs use key results to measure whether or not the organization achieves the objective. Effective PA staffs organize objectives and key results using a table. They follow these guidelines when developing key results in support of objectives:

- Clear key results to make the objective achievable.
- Quantifiable key results they tie to a number.
- Maximum of 4 key results per objective so they are measurable.

DETERMINE KEY AUDIENCE

9-16. After PA staffs define objectives and key results, staffs use the background research and analysis to determine the key audience. First, PA staffs consider the following demographic categories when developing audience segments for the social media strategy:

- Age.
- Gender.
- Affiliation (military—enlisted, officer, and other Service), civilian, family members, retirees, and contractors.
- Location.
- Marital status.
- Audience core values.

9-17. Beyond demographics, PA staffs can benefit from developing personas and identifying affinities of the intended audience. Personas, which have roots in marketing, are research-based archetypal (modeled) representations of who audiences are, what they are trying to accomplish, and what goals drive their behavior, how they think, how they buy, and why they make buying decisions. Affinities are lifestyle interests of personas and their preferences for certain products or services, respectively. Development of personas provides information necessary so that PA staffs can select an applicable social media platform.

9-18. After PA staffs identify the affinities of the intended audience, they select audience segments. These groups of people need to be informed to support the social media strategy and must be reached to achieve the goal and objectives. PA staffs identify several elements for each segment. These include demographics, behaviors, self-interests, attitudes, values, and media habits. PA staffs determine audience segments during the research section of the digital media strategy to create personas.

9-19. Lastly, PA staffs create the content calendar and implementing strategy. Content is king. Once PA staffs identify the audiences, digital media platforms, and social media platforms, they create a content calendar. The content calendar identifies the type of communication product PA staffs will use, the associated text, and the social media platform. A table or spreadsheet can display the following content calendar tasks:

- Develop digital engagement strategy to deliver messages to personas (the tools and platforms used to engage each persona).
- Create a timeline.
- Select best available platform to engage appropriate audience.
- Identify content to deliver organizational messages.
- Compose social media posts for each platform.
- Assign release schedule to support overall objectives.

Note. Completion of the content calendar results in the template to implement the digital media strategy. Even if not implementing a strategy, a content calendar by itself is a useful tool for social media maintenance.

ASSESS DIGITAL MEDIA STRATEGY OBJECTIVES

9-20. Once PA personnel implement the digital media strategy, they begin tracking effectiveness and assessing for achievement of objectives. Numerous tools exist to conduct assessments on government and social platforms. Government platforms include websites such as Digital Analytics Program (DAP), USAsearch, and Go.USA. Social platforms discuss social media insights and analytics organic to social platforms. When assessing key results, PA personnel consider ways the results support the defined objectives. If PA staffs used surveys or focus groups, they conduct a follow-up measurement. When assessing social media outreach, PA staffs evaluate both qualitative and quantitative measurements. Qualitative data can be observed and recorded whereas quantitative data can be assembled numerically. Qualitative results include anecdotal responses and message penetration as measured from key results, knowledge, attitude, behavior assessments, and surveys. Quantitative results include statics and percentages that involve the number of reaches, impressions, social media likes, shares, retweets, net change in followers, and number of direct engagements.

COORDINATE DISTRIBUTION

9-21. Effective distribution of content is key to a successful digital media strategy. An effective strategy called the hub and spoke method achieves a “dandelion” effect. (See figure 9-1 for a sample of this effect.) With this method, multiple units can act autonomously, but are guided by the priorities of and are synchronized with the U.S. Army brand enterprise. PA staffs achieve an optimal “dandelion” effect by coordinating up and down the enterprise at echelon. This coordination ensures sharing and cross-promotion of content. When PA staffs coordinate distribution properly, they maximize the amplification potential of content across key audiences.

Figure 9-1. Example of the dandelion effect of distribution coordination

SOCIAL MEDIA MAINTENANCE

9-22. Social media assists in the telling of the Army's story. More than ever before, social media is now almost unavoidable in our daily lives. PA personnel use it as a primary communication channel to engage the public and the media. The Army encourages commands, Soldiers, Families, and DA Civilians to use social media safely and accurately to share their experiences and provide information. Commanders and PA professionals understand that social media represents a shift in the way Americans have traditionally communicated. Internet-based platforms such as Facebook, Twitter, Instagram, and Snapchat provide new ways to connect, interact, and learn. Perceptions can be as powerful as the truth within social media. The Internet moves good and bad information quickly. Social media platforms instantaneously connect users with a global network, making the transfer of information even more pervasive. This highly effective tool reaches large communities and audiences.

9-23. Social media is a global and cultural phenomenon, and for many Americans it has become a part of their daily activities. Social media allows Soldiers to tell their story in an authentic and intimate manner, and is the integral piece of any digital media strategy. By interacting with Soldiers, Family members, DA Civilians, and the public on social media platforms, the Army gives its audience increased confidence in and an environment for trusted information. Social media, as part of a commander's communication strategy, helps fulfill the commander's obligation to communicate with all stakeholders. It also provides another, often

richer, means of sharing information with internal and external audiences. Stakeholders increasingly use social media, which requires a digital media strategy to meet these stakeholders where they are.

CONNECTING WITH PEOPLE

9-24. Social media broadly describes various digital communication platforms that allow for social networking. Social media connects people using digital communication technologies to share information and engage in conversations on topics of mutual interest. While specific mediums, platforms, and technologies may change in time, the overall trend of people connecting with other people using technology only increases. Social media is a powerful communications tool. When used correctly, social media can help an organization reach a much larger audience. Social media can help organizations engage in the conversation while promoting awareness of the organization's main communication priorities. However, not all Army organizations use social media effectively. Sub-optimization of social media often occur when organizations rush into social media before determining what it aims to achieve with social media platforms. Using social media effectively is a process and requires a digital media strategy, goals, manpower, and foresight.

ESTABLISHING A SOCIAL MEDIA PRESENCE

9-25. A social media presence extends beyond simply having social media accounts. It includes how the organization uses the accounts and how often they engage audiences. Most Army organizations use social media for online engagements in garrison and operational areas. Developing a successful social media presence does not happen overnight. It is a detailed process that requires extensive planning and execution. When establishing a new social media presence, PA professionals should—

- Get command approval. (See Approval of External Presences in AR 360-1).
- Review official social media policies, guidelines, resources, and training. (See the Army SlideShare website for presentations that discuss social media topics.)
- Determine your audience. PA staffs identify the intended audience and research their social media habits. Stakeholders, politicians, community leaders, criminals, imposters, and even adversaries or enemies are also watching.
- Determine staffing. PA staffs ensure appropriate staffing and resources (personnel, equipment, and connectivity) exist to meet the requirements needed to maintain the platform. They identify primary and alternate PA personnel with social media management tasks as well as identify procedures to transfer established duties.
- Research and select social media platforms. PA staffs determine whether efficiently and effectively maintaining and managing a social media account is possible. An audience's demographic determines what platforms work best to reach it. A person's age, occupation, military affiliation, nationality, and education influence the platforms that person visits.
- Select your name and branding. PA staffs use a logical and easily remembered name that avoids nicknames, call signs, acronyms, or mottos. They include the official U.S. Army logo and other branded graphics to develop a cohesive identity that supports DA efforts. (See the Army Brand Portal website to create an official social media platform.)
- Develop policies, SOPs, and training. PA staffs develop organization-specific social media policies, procedures, and training materials. They ensure the material is readily available and provide training to individuals at all levels of their organization, including Family Readiness Groups.

Appendix A

Defeating Misinformation and Disinformation

COUNTERING MISINFORMATION AND DISINFORMATION WITH CREDIBLE INFORMATION

A-1. Countering misinformation and disinformation requires diligent deterrence. PA staffs deter the adversary's use of misinformation and disinformation with rapid decision making and with informing the public. PA staffs must understand adversarial communication cycles to implement rapid decision making. Deliberate planning that incorporates timely, accurate communication before, during, and immediately following operations mitigates the relative advantage adversaries can gain through speed. PA staffs rapidly make recommendations so commanders can make decisions. Such rapid decision making can reduce lag time through planning while considering the most efficient processes and procedures necessary to produce, approve, and disseminate truthful and accurate information and imagery.

A-2. PA staffs counter misinformation and disinformation by informing the public. Adversary disinformation frequently targets the resolve of the American public. PA staffs counter these disinformation efforts by informing the American public of a threat and affirming trust and resolve in the Army and the command.

A-3. PA staffs provide a continuous flow of credible, reliable, timely, and accurate information and imagery to internal and external audiences. Being first with accurate information helps the commander establish the narrative. PA capabilities help deter adversary efforts to diminish national will, degrade morale, and turn world opinion against friendly operations. Gaining and maintaining the information initiative in a conflict can help discredit and undermine adversary disinformation, and may discourage adversarial malign narrative efforts completely.

A-4. Soldiers assess misinformation and disinformation to determine the source, intent, target, and effects. Informing to facilitate educated decision making counters misinformation and disinformation from others and helps prevent inaccurate information from causing faulty or uninformed decisions.

SYNCHRONIZATION WITH INFORMATION-RELATED CAPABILITIES

A-5. PA personnel synchronize communication efforts with IRCs to counter adversary misinformation and disinformation. The primary coordinator of Army public information is Army PA. Coordinated and synchronized release of information can help counter disinformation as well as help create, strengthen, or preserve conditions favorable for the advancement of national interests and policies. Synchronized actions, images, and words enables successful execution of a commander's communication strategy. Army actions that conflict with official statements, information, or imagery can confuse the public and potentially create lost credibility with that public.

A-6. As PA staffs synchronize IRCs, they ensure actions, themes, and messages complement, reinforce, and are de-conflicted with each other. Such synchronization facilitates units achieving their objectives. PA staffs use the communication synchronization process to synchronize IRCs. (See paragraph 5-57 for a discussion on communication synchronization process.) PA staffs synchronize with IRCs such as IO and MISO.

A-7. It is critical that PA and IO staffs, and especially MISO staffs, synchronize their communications efforts with respect to the adversary due to the fluidity of the information environment. Army PA and IO activities directly support military objectives; counter adversary misinformation and disinformation; and deter adversary actions. Both PA and IO staffs plan and execute information activities and conduct media analysis. IO differ with respect to public, scope, and commander's intent. As such, IO are separate functional

areas. Commanders ensure appropriate coordination between PA and IO activities consistent with the DOD Principles of Information, policy, or legal limitation and security.

LINES OF EFFORT RELATIONSHIPS

A-8. PA personnel use lines of effort relationships to counter adversary information efforts of misinformation and disinformation. These lines of effort enable PA staffs to focus efforts from many partners to establish operational and strategic conditions by linking their tasks. PA staffs receive information from various sources, staffs, and command levels that often conflicts and contributes to misinformation. PA staffs counter opportunities that adversaries take to undermine the credibility of Army PA, communicators, and other friendly organizations. PA staffs maintain a line of effort drive with—

- Intelligence staff.
- OPSEC staff.
- VI personnel.
- Public diplomacy officials.
- Staffs from intergovernmental agencies and departments.
- Personnel from intergovernmental organizations and nongovernmental organizations.
- Host-nation government partners.
- Multinational partners.
- Military information support personnel.
- Information operations personnel.
- Military deception (MILDEC) personnel.
- Foreign policy advisor.

INTELLIGENCE STAFF

A-9. Intelligence staff provides historical and human factor analysis that gives context helpful in evaluating and anticipating adversary disinformation. PA staffs coordinate regularly with open-source intelligence sections and use intelligence assessments and products to plan and enhance PA activities. Requests for intelligence, surveillance, and reconnaissance information and imagery supports the PA mission. Critical information requirements are often mutual between PA and intelligence sections. Intelligence assessments and products can assist PA in developing communication products and PA information provides content for intelligence analysis.

OPERATIONS SECURITY STAFF

A-10. OPSEC staffs evaluate information. PA staffs require OPSEC evaluations particularly for risks related to information proposed for public release. The guiding principle to protect classified, sensitive, and enemy exploitive information is security at the source. Information released inadvertently or intentionally that has not undergone an OPSEC review can provide adversaries with an advantage in their disinformation efforts. PAOs are often the designated release authority. They must thoroughly review imagery and information prior to public release. PAOs are required to be OPSEC Level II qualified. (See AR 360-1 or qualifications.) Balancing OPSEC requirements for security with the need to disseminate critical information in a timely manner enables PAOs to ensure adversaries do not obtain material that would assist their disinformation mission.

VISUAL INFORMATION PERSONNEL

A-11. Visual information effectively counters disinformation. VI personnel provide visual facts to counter deceptive claims or speculation and to bridge the gap between cultures and languages. Quality imagery supported with accurate information has a greater chance of permeating public perception. PAOs use such imagery in products supplemental to traditional and social media channels. VI staffs provide products that assist the commander's effort to bolster public understanding of operations as well as counter adversarial disinformation. PA staffs consider OPSEC before releasing visual imagery from drones or planes; while useful, some imagery proves difficult to release due to classification. Original, unaltered visual imagery is a

compelling tool in combatting disinformation and lends credibility to commanders' efforts to establish and promote the command narrative. Altering official DOD imagery is prohibited with exception for corrections, modifications, and enhancements as specified. (See DODI 5040.02 for imagery policy.)

STAFFS FROM INTERGOVERNMENTAL AGENCIES AND DEPARTMENTS

A-12. Effectively operating in a shared information environment requires PA staff to partner with intergovernmental agencies and other interagency departments interested in communicating common U.S. Government objectives and activities. Operations require consistent communication with approved themes, messages, narratives, and talking points to support the mission and prevent misinformation. PA staffs work with U.S. Government departments and agencies to communicate information quickly and effectively to the public, avoid misinformation, and prevent opportunities for adversarial disinformation campaigns. An example of this shared information among PA staff and intergovernmental departments is the release of information regarding weapons of mass destruction. Such a release can involve non-DOD lines of communications and authorities such as State Department or other diplomatic entities.

PERSONNEL FROM INTERGOVERNMENTAL ORGANIZATIONS AND NONGOVERNMENTAL ORGANIZATIONS

A-13. Intergovernmental organizations and NGOs commonly coordinate communication with PA staffs to mitigate adversarial efforts to spread misinformation regarding foreign humanitarian aid, immunization programs, and foreign government cooperation. Army personnel often work alongside personnel from IGOs and NGOs in theater during military operations. Army personnel deploy to humanitarian aid and disaster relief situations where adversaries will seize any opportunity to discredit and spread doubt.

HOST-NATION GOVERNMENT PARTNERS

A-14. Host-nation governments often support Army operations when they need to communicate with their audiences concerning activities that Army forces conducts in their borders. Open lines of communications and strong partnerships allow credible information to be shared freely between the host-nation and the Army; PA personnel help the host-nation government with this communication. The host nation ensures that audiences understand its relationship with the Army forces, expectations from Army forces, and achievements by Army forces. PA staffs help the host nation identify local issues and concerns related to Army forces, coordinate with PA staffs at the respective embassy, and maintain close coordination with IO planners.

MULTINATIONAL PARTNERS

A-15. PA staffs help coordinate and synchronize the necessary messages used with multinational partners to counter adversary information efforts of misinformation and disinformation. As part of the *National Security Strategy*, the Army commonly works with multinational partners and foreign militaries to build capacity, solve international crises, conduct routine training, and enhance theater security cooperation. Adversaries often seek to fracture multinational partnerships through disinformation in efforts to create an operational area that is more difficult and costly to conduct missions in.

MILITARY INFORMATION SUPPORT PERSONNEL

A-16. PA staffs coordinate with military information support personnel to influence foreign publics to favor U.S. objectives while countering adversarial misinformation and disinformation. MISO seeks to influence the target public's attitudes, opinions, and behaviors while PA seeks to inform and educate international publics. Both staffs continually coordinate to ensure they do not deliver misinformation. Military information support personnel can support approved DSCA missions during continental United States operations by conducting civil authority information support. This support can deliver critical information using information dissemination, printing, reproduction, distribution, and broadcasting. The lead federal agency responsible for the content in civil authority information support products coordinates with PA staffs to ensure the prevention of misinformation.

INFORMATION OPERATIONS PERSONNEL

A-17. IO and PA personnel support the commander's objectives to counter adversary propaganda, misinformation, and disinformation as well as deter adversary actions. Appropriate coordination between IO and PA occurs during planning their respective communication capabilities to support military operations and accomplish the mission. Although PA and IO IRCs and coordination activities can appear as similar, they are not. IO is a separate function and differs with respect to authorities regarding domestic and international populations, scope, and intent. PA primarily seeks to inform and educate audiences, while affecting the content and flow of information that impacts adversaries' decision making. IO on the other hand primarily seeks to influence, disrupt, corrupt, or usurp the decision making of adversaries and potential adversaries while protecting our own. Adversaries often seek to blur the lines between IO and PA operational functions, publics, and information to confuse or influence a target population with no regard for the populations' situational understanding.

MILITARY DECEPTION PERSONNEL

A-18. PA staffs coordinate with MILDEC personnel to counter adversarial misinformation and disinformation. MILDEC deliberately misleads enemy military, violent extremists, or other violent adversarial decision makers to take specific actions (or inactions) that can contribute to friendly mission accomplishment. PA personnel and assets provide truthful information that is not used to conduct MILDEC. PA personnel coordinate with MILDEC personnel for the success of MILDEC operations. This coordination ensures that MILDEC operations do not include PA information since such an inclusion violates OPSEC. This coordinated effort leads to a MILDEC operation that has the sole purpose to confuse the enemy.

COMMUNICATION

A-19. PA personnel use communication to counter adversary information efforts of misinformation and disinformation. Communication that fails to produce understanding by a public through misinterpretation, misrepresentation, or poor delivery can hinder a PA mission and may benefit adversarial malign narrative efforts. An adversary has less difficulty in reaching its objective if the public is misinformed directly through poor communication.

A-20. Traditional media are still the principal means to communicate with publics. PA staffs need media access to counter disinformation and ensure the flow of critical and accurate information to publics. PA planning includes detailed processes, procedures, and support requirements to enable media to meet Army personnel so media representatives can better understand the mission, dispel rumors, and dismiss misconceptions of scripted dialogue regarding the conduct of operations. This direct access requires PA staffs to inform unit personnel at all levels on the PA mission. PA staffs implement an active command information program and deliberate PA training. Such training teaches personnel to participate in interviews with news media representatives and respond appropriately to questions regarding operations. Personnel also learn OPSEC for interviews that meets the needs of the media and protects security of the mission.

A-21. Operations occur internationally, regionally, and locally, necessitating effective public communication that requires both cultural and language capabilities. PA staffs acquire capabilities to support a range of media in accordance with DOD directives and joint policy. Ideally, PA training, media facilitation, responses to query, and media embed operations can accommodate reporters who do not speak English. PA operations especially focus on accommodating host-nation or regional media outlets critical in informing publics most often targeted by disinformation campaigns. Effective PA operations include news releases, public information, and internet sites with applicable regional or local language capability.

A-22. PA staffs traditionally use mass media to reach broad publics. Such mass media often requires communication to be more direct and tailored to specific publics through face-to-face discussion, correspondence, targeted radio broadcasts, newspapers, and digital media. Tailored communication can target friendly, neutral or indifferent, and adversarial publics.

A-23. PA personnel develop quality and accurate media products that support the commander's objectives, set an accurate and truthful command narrative, and deter adversaries. They then leverage available technology to disseminate it rapidly to select publics. Army journalists assigned and embedded in units at all

echelons tell the Army story to intended publics by documenting events and unit actions as they happen. This documentation enables commanders to inform and educate populations in and around a theater of operations.

A-24. PA views communication as a dialogue among people and actively facilitates communication with publics internationally and domestically. Encouraging communication among people facilitates commanders to deter adversarial misinformation and disinformation. PA staffs assist commanders with research and theory to identify key publics and create tailored communication plans to meet specific communication objectives.

A-25. PA personnel must stay abreast of the rapid changes in communication technology. Traditional media does not solely inform and educate key publics like it used to. Digital video, smart phone technology, chat services, and social media move information around the world almost instantaneously. PA communication plans must account for this reality since PA staffs' time to shape the narrative is both greatly reduced and greatly enhanced because of it. Recently, viral social media events—especially in video form—have become an influential method for both misinformation and disinformation. Effective PAOs must be prepared to mitigate these types of events when they occur.

A-26. Countering disinformation requires consistent, coherent, and comprehensive communication originating from synchronized plans. Such plans can include PA running estimates, key public identification, aligned messages and actions, engagement plans, identified spokespersons and representatives, decision points, and assessment measures. The CCS working group typically guides the communication approach, synchronizes communication, and coordinates internal and external audiences who communicate with the command.

TIMEFRAMES

A-27. PA personnel use various timeframes to counter adversary information efforts of misinformation and disinformation. Countering disinformation successfully occurs across short-term, medium-term, and long-term timeframes. Tactics and techniques change across these periods, but PA staffs still must coordinate communication simultaneously. PA staffs ensure that actions and communication are complementary and integrated across all periods to counter disinformation.

SHORT-TERM

A-28. Countering disinformation in the short-term requires identifying and preparing the following:

- Topic or issue requiring attention and response.
- Spokesperson with credibility, presence, appearance, training, and public relationship.
- The type of response necessary.
- The speed or timing of response.
- Mitigation of misinformation and disinformation.

A-29. Rapid decisions are necessary to counter adversary misinformation and disinformation in the short-term. Accurate information delivered first against an adversary requires the commander to assume some risk and may require release authority delegated to lower echelons. The access journalists have affects public perception. The public often perceives granting journalists access to the command for reporting on issues or crisis events as more credible than PA staffs disseminating self-reported information. Third-party advocating is most effective in countering adversarial disinformation.

A-30. In addition, PA staffs counter adversarial disinformation by addressing the adversary's uncertainty regarding the issue, credibility (past and present), lack of verifiable or corroborated information, and transparency. Ideally, PA staffs target the source of disinformation for discrediting, whether an individual or group, to correct the record publically. Deception is the root of disinformation.

MEDIUM-TERM

A-31. Countering disinformation in the medium-term requires PA staffs to determine the commander's current position regarding an operational environment. PA staffs then identify and prioritize communication objectives given the time allowed before execution of the disinformation tactics. PA personnel continuously analyze information and the environment. The results of this mid-term analysis define the perceptions,

attitudes, and behaviors of publics affected by operations. PA staffs gather information to achieve understanding of the publics and prevent opportunities for disinformation effects.

A-32. Different publics require different, tailored messages to counter misinformation. In mid-term timeframes, PA personnel have time to tailor messages to reach intended publics. Messages are important communicators of the position a command has on a topic. A mid-term timeframe enables PA staffs to draft support carefully for a particular theme that does not conflict with another theme. With this additional time, internal cultural advisors and other stakeholders can validate a message by analysis thus preventing unintended message perception or vulnerability to adversarial misinformation.

A-33. Message delivery requires considering the delivery method, culture, and language barriers. Perception of the message can vary based on leader relationships, public bias of media selected to carry the message, political relationship, and past public communication. Determining the knowledge a public has regarding an issue helps PA to determine whether the communication approach should allow for opposing viewpoints or two-sided communication.

A-34. Two-sided communication requires careful planning but is most effective when the public is knowledgeable about the issue or is opposed to the position of the message. This approach also can provide an opportunity for an adversary's disinformation to be discredited point for point, thus achieving correction of the misinformation. Lack of planning for two-sided communication can just as easily reverse the intended affect and provide credibility to an adversary if the adversary carefully designs misinformation delivered in a manner that a public more easily understands.

LONG-TERM

A-35. Countering disinformation in the long-term requires nurturing relationships and engaging in a dialogue of ideas. Building and nurturing relationships can be difficult when commanders and personnel change out over relatively short periods. Maintaining consistency of credibility and communication is even more important to ensure the publics that, regardless of the commander, they can expect truthful and honest communication that underpins enduring positive relationships. Stakeholders requiring enduring relationships can include the media, government departments, agencies, NGOs, IGOs, and host-nation governments.

A-36. Engagement in a dialogue of ideas can build immunities against disinformation when conducted transparently, respectfully, and truthfully. Respectful consideration for other viewpoints, active listening, and sharing of perspectives on various subjects is valuable against adversary disinformation. Dialogue differs from debate. Dialogue seeks to share and understand various perspectives. Debate typically pits opposing viewpoints against each other and seeks a win. Adversarial disinformation seeks to deceive and confuse a public to advance an agenda not compatible with dialogue.

COUNTERING SOCIAL MEDIA AND ONLINE MISINFORMATION AND DISINFORMATION

A-37. Social media has demonstrated its ability to inform, educate, and influence, but it is just as capable of providing misinformation rapidly. PA personnel must maintain a consistent and an effective presence on social media to counter disinformation. Active monitoring by trained and informed PA personnel ensures that a continuous dialogue exists among Army forces and domestic and international publics. Depending on the operation, commanders need PA personnel who have cultural and language training to advise on the most effective social media tools and employment strategies.

A-38. Social media enables instantaneously addressing misinterpretations and misinformation without the mediation effects that traditional media can have. PA personnel can use social media effectively to address misinformation. However, when countering misinformation, PA personnel cannot depend on only one channel. They require a comprehensive use of traditional and nontraditional media to correct the record.

A-39. Adversaries use internet-based communication channels to send false information to susceptible publics. Social media have enabled every user to be a self-proclaimed journalist, publisher, advocate, activist, or spokesperson with no formal training, credentials, or editing for accuracy and facts. Since adversaries can publish anonymously or change user identification, limited accountability exists. Social media were not

designed for disinformation efforts, but adversaries use this technology to support misinformation, deception, and fraud, often with devastating effects.

A-40. Disinformation in word and technology is planned and sophisticated deception. Detecting and countering disinformation is even more challenging on social media. Available systems easily portray photographs, information, and news links. Savvy adversaries have adapted such systems to portray any depiction of imagery, events, or news that they create or manipulate. Adversaries can also alter and distribute photographs, videos, and narratives without linking them to a specific disinformation source. Perceptive adversaries can even manipulate accurate truthful news and information to deceive the public. Misinformation and disinformation via social media has proliferated as more people use social networks as their primary information or news source.

A-41. Misinformation is not always adversarial, but can materialize from speculative reporting on events or incidents such as accidents, casualty causing actions, and conflicts. PA personnel measure the quality of information by its accuracy and its source. When the public receives unverified political commentary, punditry, rumors, or narratives contrived as facts, they spread as quickly through social networks as facts.

A-42. Before countering misinformation, PA staffs must first attempt to understand a public's reasons for believing the information. Strongly held beliefs based on misinformation can result in greater support for an adversary's ideology if the counter to the false narrative offends the sensibilities of the receiving public. Therefore, effective PA staffs must be culturally adept and deliberate when dismantling a false narrative lest doing so threatens the mission and command relationship with certain audiences.

A-43. Countering social media disinformation can be tricky. Sometimes active countermeasures may actually amplify a false or misleading narrative. Before acting, PA staffs consider whether taking action against or acknowledging the misinformation will cause other negative consequences. These staffs consider if action will increase the public's awareness to the misinformation or if action will provide the adversary a form of credibility in some publics' opinion.

A-44. If the commander does choose to counter disinformation, PA personnel need to provide a credible and thorough alternative narrative to the disinformation. PA personnel avoid repeating the false narrative, when possible, and without repeating the misinformation. In addition, if mentioning the misinformation is necessary, PA personnel warn the public so as not to falsely credit a source. Finally, PA personnel properly synchronize the efforts of and deliver at a tempo acceptable to all stakeholders.

A-45. PA staffs' counter of disinformation in social media do not significantly differ from traditional or mass media's attempts. Publics are more likely to accept information that is consistent with other information they perceive as credible. PA staffs analyze the public to determine preexisting beliefs and importance of the beliefs' role in their acceptance of friendly messages. The publics' familiarity with the communicator, their established credibility, and mode of delivery all contribute to message acceptance.

COUNTER NARRATIVE

A-46. Narratives are stories or accounts of events, experiences, or the like, whether true or fictitious. They are stories constructed to give meaning to things and events. Individuals, groups, organizations, and countries all have narratives that reveal how they define themselves. Adversaries often attempt to develop a counter narrative using blatant misinformation and even partially truthful information to promote their agendas.

A-47. Army PA supports the Army's narratives through the truthful telling of the Army story and enduring communication that helps define the commander's goal and desired end state. Army operations, words, actions, and imagery support the DOD strategic narrative. Failure to design communication around overarching narrative consistently provides adversaries with opportunities to exploit U.S. credibility set at an adversarial counter narrative.

A-48. Adversaries of the United States often attempt to develop their own narrative to promote their own objectives and malign narrative agenda. They might use blatant misinformation and even partially truthful information. These opposing forces seek to gain superiority over U.S. or partner nation narratives and discredit the appeal of the friendly narrative while making that narrative irrelevant. This battle of narratives occurs in the information environment but is affected by actions in an operational area, both intended and unintended.

A-49. Winning the battle of narratives requires PA staffs seeking potential vulnerabilities within the messages and anticipating communication actions of the adversary. PA staffs gain perspective by listening to key publics, understanding their needs, and learning what they expect is part of having a direct dialogue with the same publics that an adversary is attempting to deceive.

A-50. PA staffs hold an important position in a battle between competing narratives. Army PA staffs counter the adversarial narrative by executing timely, accurate, synchronized communication. This is the counter narrative, which is simply a narrative going against another narrative. Coordinated counter narratives against adversaries of the United States is necessary to defeat radical violent extremism, adversarial nation states, and non-nation state actors attempting to conduct disinformation operations that threaten an operational area. PA personnel coordinate properly with stakeholders to ensure that a narrative meets the commander's intent, is useful, is synchronized, and ultimately supports the operation plan.

NARRATIVE TYPES

A-51. There are two types of narratives: mission and subject. A mission narrative is the expression of the commander's operational approach for a specified mission. A subject narrative is the expression of the tactical approach for a specified mission. Both narratives aim to be effective. Effective narratives, like other communication products, aid in the dissemination of an organization's message, assist in the organization achieving its desired effects, and are easily understandable. An effective mission or subject narrative should—

- Tell a story by engaging a public.
- Explain the history of a conflict (or an operation).
- Explain unit or organizational actions such as the role a unit plays in achieving the desired effects.
- Explain the way ahead through lines of effort.
- List the end state (what success looks like).
- Include all stakeholders responsible for executing.
- Discuss and use to achieve the intended communication end state.
- Be refined as the situation changes to ensure relevance and maintain its ability to impact.

A-52. A mission narrative describes the intended effects for the mission, including conditions that define the desired end state. It represents the articulation or description of the commander's visualization for a specified mission and forms the basis for the concept of operations developed during detailed planning. It is an explicit reflection of the commander's logic used to inform and educate various mission stakeholders and partners, whose perceptions, attitudes, beliefs, and behaviors can influence the operation. This is very useful in exponentially increasing communication while protecting the mutual understanding and cooperation that partner communicators share. Common adoption of the mission narrative makes it more difficult for an adversary to inject misinformation into an information environment governed by a common narrative.

A-53. Mission narratives inform the development of supporting information themes and messages for the mission. They serve as vital tools for integrating information engagement tasks with other activities during execution. A mission narrative is a concise descriptive account of the mission as a whole. It provides the end-to-end context for the events of the operation or campaign and explains why the operation is necessary. A mission narrative seeks to motivate and facilitate coordinated action by helping the public understand how actions will lead to desired goals and to explain the benefits upon successful conclusion of the effort. It provides a coherent and compelling framework that links the evolution of the situation with the challenges of today, the actions necessary, and the ultimate benefits.

A-54. Mission narratives are divided into four parts. Part 1 discusses the history of the area of operations and provides reasons for the conduct of operations in the operational area. Part 2 lists expected successes and planned progression of the operation. In this part of the narrative, an organization's progression is listed in a 1 to 3 sentence bullets that provide details in support the statement of progress. Part 3 points the way forward focusing on lines of effort that link directly with a higher headquarters' campaign plan. Part 4 describes how the commander's desired end state nests with the higher headquarters campaign plan, be it tactical, operational, or strategic.

A-55. A subject narrative is the expression of the tactical approach for a specified mission. It links to a specified mission and is more specific in scope than a mission narrative. Subject narratives contain the same four parts of a mission narrative. In understanding the narrative and its place within the body of available communication products, PA professionals must understand that a narrative is not a stand-alone document, but is supported with other communication products that synchronize the commander's communications efforts in support of operations. These PA professionals to understand that a single narrative at the strategic level will not effectively support messaging and communication efforts at all levels. Narratives at the strategic, operational, and tactical (unit) levels ideally nest with and support overarching themes, messages, narratives, talking points, effects, and end states via vertical integration for both higher- and subordinate-level organizations. It is critical that narratives nest at all levels with easily ascertainable integration.

Appendix B

Public Affairs Running Estimate

RUNNING ESTIMATE OUTLINE

B-1. The running estimate provides the basic outline of situations and considerations, mission, courses of action, analysis, comparison, and recommendations and conclusions. Effective plans and successful execution hinge on accurate and current running estimates. A *running estimate* is the continuous assessment of the current situation used to determine if the current operation is proceeding according to the commander's intent and if planned future operations are supportable (ADP 5-0). Failure to maintain accurate running estimates may lead to errors or omissions that result in flawed plans or bad decisions during execution.

B-2. Running estimates are principal knowledge management tools used by the commander and staff throughout the operations process. In their running estimates, the commander and each staff section continuously consider the effect of new information and update the following:

- Facts.
- Assumptions.
- Friendly force status.
- Enemy force status.
- Civil considerations.
- Conclusions and recommendations.

B-3. Running estimates always include recommendations for anticipated decisions. During planning, commanders use these recommendations to select feasible, acceptable, and suitable courses of action for further analysis. During preparation and execution, commanders use recommendations from running estimates in decision making. While staffs maintain formal running estimates, the commander's running estimate is a mental process directly tied to the commander's visualization. Commanders integrate personal knowledge of the situation, analysis of the operational and mission variables, assessments by subordinate commanders and other organizations, and relevant details gained from running estimates. Commanders use their running estimates to crosscheck and supplement the running estimates of the staff.

B-4. Commanders maintain their running estimates to consolidate their understanding and visualization of an operation. The commander's running estimate summarizes the problem and integrates information and knowledge of the staffs and subordinate commanders' running estimates. Each staff element builds and maintains running estimates. The running estimate helps the staff to track and record pertinent information and provide recommendations to commanders.

B-5. Running estimates represent the analysis and expert opinion of each staff element by functional area. Staffs maintain running estimates throughout the operations process to assist commanders in the exercise of mission command. Each staff element and command post functional cell maintains a running estimate focused on how its specific areas of expertise are postured to support future operations. Because an estimate may be needed at any time, staffs develop, revise, update, and maintain running estimates continuously while in garrison and during operations. While in garrison, staffs must maintain a running estimate on friendly capabilities. Running estimates can be presented verbally or in writing. (See FM 6-0 for more information on running estimates.)

BASE RUNNING ESTIMATE

B-6. A comprehensive running estimate addresses all aspects of operations and contains both facts and assumptions based on the staff's experience within a specific area of expertise. Each staff element modifies it to account for its specific functional areas. All running estimates cover essential facts and assumptions, including a summary of the current situation by the mission variables, conclusions, and recommendations. See figure B-1 for a sample PA running estimate.

[CLASSIFICATION]

1. (U) SITUATIONS AND CONSIDERATIONS.

a. (u) Area of Interest. Describe the strategic and operational media environment in which the operation is being conducted and identify the critical factors—the “action and reaction” within global media channels—that might impact the mission. Identify the media environment across the operational continuum, describing it from “austere” for low media interest and capability in a limited area of operations (AO) communication infrastructure to “dynamic for high media interest and capability in a high-tech AO infrastructure.

b. (U) Characteristics of the Area of Operations.

(1) (U) Terrain. List all critical terrain aspects that would impact public affairs operations (such as hilly terrain obscuring satellite dishes for receiving television broadcasts) or require additional support and requirements for escorting media.

(2) (U) Weather. List all critical weather aspects that would affect public affairs operations. Refer to Tab B (Weather) to Appendix I (Intelligence Estimate) to Annex B (Intelligence), as required.

(3) (U) Enemy Forces. Describe enemy public affairs and media disposition, composition, strength, and systems. Describe the enemy’s capabilities and most likely and most dangerous public affairs courses of action (COAs). Forces hostile to U.S. interests can be expected to:

- Attempt to mold U.S. and foreign public opinion using propaganda, misinformation, and fictionalized reporting to discredit the United States and its allies, creating opposition to the operation.
- Seek information about U.S. intentions, military compatibilities, and current activities.
- Use the publicity generated by (potential) terrorism to promote their ideology.

(4) (U) Friendly Forces. List current public affairs resources in terms of equipment, personnel, and systems. Identify additional resources available for the functional area located at higher, adjacent, or other units. List those capabilities from other military and civilian partners that may be available to provide public affairs support. Compare requirements to current capabilities and suggest solutions for satisfying discrepancies.

(a) (U) Higher headquarters public affairs resources and capabilities.

(b) (U) Organic public affairs resources and capabilities.

(c) (U) Attached public affairs units’ resources and capabilities.

(d) (U) Information channel availability. An assessment of the information channels available for the communication of the information in an out of the AO. It identifies the means available to the commander for receipt, transmission, and dissemination of public information.

(5) Civil Considerations.

(a) (U) Media presence. Assess the news media presence in the area of interest prior to deployment and the likely presence of additional news media during the conduct of operations. This assessment should address the authority under which media representatives are operating and the degree of control that can be imposed on their efforts.

(b) (U) Media capabilities. An assessment of the media’s information collection and communication technology, specifically identifying their level of visual information

[page number]

[CLASSIFICATION]

Figure B-1. Sample public affairs running estimate

[CLASSIFICATION]

(c) (U) Media content. *An assessment of the global media's presentation of information and their agendas, an analysis and prioritization of the potential strategic and operational issues confronting the command in the news media. This media content analysis will provide an evaluation of the quantity of coverage and the nature of that coverage.*

(d) (U) Public opinion. *Assessment of the national attitude about the operation and command, leaders, and Soldiers conducting it. This paragraph should include both the perceptions held by major audience groups and the relative solidity or strength of these attacks. A public opinion analysis should include at a minimum an analysis of the following groups:*

- *American public.*
- *Political leaders.*
- *Coalition forces and unified action partners and their publics.*
- *International audiences.*
- *Internal command audience.*
- *Home station public.*

c. (U) Assumptions. *Until specific planning guidance from the commander becomes available, use assumptions for initiating planning or preparing the public affairs running estimate. Modify these assumptions as factual data or planning guidance becomes available.*

2. (U) MISSION. *Enter the restated mission from a public affairs perspective. A mission statement contains no subparagraphs. Keep the American people informed of the operation to the maximum extent possible within the constraints of operations security and personnel safety. Provide public affairs support to on-scene commanders. Provide the media with access to unclassified, timely, and accurate accounts of the operation to counter enemy propaganda and disinformation efforts that discredit U.S. political and military efforts.*

3. (U) COURSES OF ACTION.

- a. (U) *List friendly COAs that were war-gamed.*
- b. (U) *List enemy actions or COAs that were template that template that impact public affairs.*
- c. (U) *List the evaluation criteria identified during COA analysis. All staffs use the same criteria.*

4. (U) ANALYSIS. *Analyze each COA using the evaluation criteria from COA analysis. Review enemy actions that impact public affairs as they relate to COAs. Identify issues, risks, and deficiencies these enemy actions may create with respect to public affairs. Analysis should focus on media facilitation and support, news and information provision, and force training and support. Analyze each COA from a public affairs point of view to determine its advantages and disadvantages for conducting public affairs.*

5. (U) COMPARISON. *Compare COAs. Rank order COAs for each key consideration. Use a decision matrix to aid the comparison process. List advantages and disadvantages of each COA under consideration. Include methods for overcoming deficiencies or modifications required for each COA.*

6. (U) RECOMMENDATIONS AND CONCLUSIONS.

- a. *Recommend the most supportable COAs from the public affairs perspective. Indicate the abilities of the command and other supporting staffs to assist in public affairs.*
- b. *Prioritize and list issues, deficiencies, and risks and make recommendations on how to mitigate them.*

Appendix C

Proposed Public Affairs Guidance

PREPARING AND OBTAINING APPROVED GUIDANCE

C-1. PAG is an operational tool that guides commanders and their PAOs in applying doctrine and policy during major military operations, exercises, and contingencies. Local commanders use the information in paragraphs B-2 and B-3 to assist in preparing and obtaining approved guidance.

C-2. DOD policy requires that commanders provide the PPAG to the ATSD (PA) as the sole approving authority by combatant commands and others, as required for all major operations. This requirement includes major training exercises that could attract international or national attention. PAOs commonly prepare PPAG at their echelon and forward that PPAG through command channels for approval. PAOs ensure PPAG is coordinated with appropriate staff and other organizations, as appropriate. PAOs cannot use PPAG without appropriate echelon approval. (See DODI 5405.03 for PPAG guidance.)

C-3. Upon receipt of the order, the commander, through the PAO, requests PAG from higher headquarters. PAG may be included in an alert order or operation orders. Commanders direct their PAOs to prepare PPAG to forward through command channels to the appropriate approval authority. Commanders of combatant commands ensure that the staff coordinated the PPAG with appropriate organizations within the theater of operations whenever possible (such as embassies, country teams, host-nation governments, and subordinate commands).

PROPOSED PUBLIC AFFAIRS GUIDANCE FORMAT AND CONTENT

C-4. PAOs submit PPAG by email as a document with 1-inch margins and Times New Roman, 12-point font. They avoid using “all caps” font. All PPAG submissions include the sections discussed in paragraphs C-5 through C-25 and shown in figure C-1 beginning on page C-6. Insert “N/A” (for not applicable) for each numbered PPAG paragraph that is not needed or does not apply for the specific PPAG.

C-5. The format for PPAG is as follows:

- Classification
- Subject.
- Paragraph 1: References.
- Paragraph 2: Background and Coordination.
- Paragraph 3: Public Affairs Posture. It includes active PA posture and response-to-query posture.
- Paragraph 4: Holding Statement.
- Paragraph 5: Public Statement.
- Paragraph 6: Themes and Messages.
- Paragraph 7: Questions and Answers.
- Paragraph 8: Public Affairs and Communication Planning Instructions and Command Relationships.
- Paragraph 9: Media Operations.
- Paragraph 9.1: Owned Media.
- Paragraph 9.2: Media Information Centers.
- Paragraph 9.3: Media Embeds or Embarks and Space Available Travel.
- Paragraph 9.4: Media Operations
- Paragraph 10: Public Affairs Points of Contact.
- Paragraph 11: Declassification Instructions.

CLASSIFICATION

C-6. PAOs normally submit PPAG via unclassified email on a Non-classified Internet Protocol Router Network (NIPRNET) system and marked “CUI” (for Controlled Unclassified Information) as the first line of the document. However, PAOs determine the classification of the PPAG according to the classification of the material from which the PPAG was derived and the sensitivity of the event itself.

SUBJECT

C-7. The subject line of the PPAG states “Proposed Public Affairs Guidance for [Insert Name of Operation, Exercise, or Event].” For purposes of distribution and coordination, the subject remains unclassified. If PAOs cannot use an operation, exercise, or event name, they will use an unclassified short title. When the authority approves the PPAG, PAOs will change the subject line to “Approved Public Affairs Guidance (PAG)” for returning it to the submitting DOD component.

PARAGRAPH 1: REFERENCES

C-8. Following the subject line, the first numbered paragraph lists references. This paragraph includes all pertinent messages, orders, DOD and military Services publications, publications that apply to PA policy, and the release of information to the public, strategic communication or other guidance, and other documents as appropriate that informed the process of drafting the PPAG. PAOs use the most current version of all references. This paragraph lists references using a lettering system—such as (a), (b), (c)—and, if applicable, include the message date-time-group and the publication date. This paragraph explains what each reference means and how it contributes to the PPAG. This section is generally not for public release.

PARAGRAPH 2: BACKGROUND AND COORDINATION

C-9. This paragraph explains the purpose of the operation, exercise, or event and describes any significant existing or anticipated problems and limiting factors. It explains how and why DOD assets are participating and why PAG is needed. The paragraph gives background with historical information as well as a description of the current situation. The paragraph may also include communication objectives, key audiences, and other planning guidance on how stakeholders coordinate PA activities among agencies and host nations. This section is generally not for public release.

PARAGRAPH 3: PUBLIC AFFAIRS POSTURE

C-10. This paragraph states the overall PA posture for the operation, exercise, or event. It also states which DOD component retains the PA lead. Only two PA postures are authorized for use: active PA posture and RTQ posture.

Active Public Affairs Posture

C-11. An active PA posture is recommended whenever possible. An active PA posture involves using various communication methods and mediums to stimulate public and media interest, such as distributing press releases and inviting media to cover events, exercises, or operations. The term “active” can have multiple meanings; not all active PA postures are the same, with some more limited in scope than others. This posture is specific. For example, if the intent is to start in a RTQ posture and then move to an active posture, this paragraph provides as much detail as possible (for example, using a holding statement until an initial announcement by a public statement or press release). This paragraph provides specific guidance on what tactics commanders desire after the initial announcement.

Response-to-Query Posture

C-12. An RTQ posture is recommended when there is a desire not to take action to generate media or public interest beyond responding to media queries. On occasion, the PA posture is RTQ until a certain point in the planning and execution of an operation, exercise, or event. At that time, the RTQ posture may change to an active posture. On other occasions, the PA posture will remain RTQ for the duration or until completion of a

military operation, exercise, or event. All PPAG should specify all units or personnel authorized to respond to queries. Release authority at the lowest possible level with security at the source is recommended.

C-13. Some PA personnel mistakenly believe there is a “passive” option to not say anything about a specific military operation. Not responding to a query is not an option. Professional communicators should always be able to respond using a prepared holding statement, even if it is something as simple as “the information you are asking for is classified and not to be discussed publicly.” If applicable, clearly identify when an RTQ posture will change to an active PA posture.

PARAGRAPH 4: HOLDING STATEMENT

C-14. PPAG contains a holding statement PAOs use before release of the approved PAG. Usually, the holding statement emphasizes the nature of the planning process and stresses operational details PAOs are not to discuss before an event, operation, or exercise has been formally announced. PAOs can modify this approach as circumstances dictate. When using a strict RTQ posture, sometimes the holding statement may also serve as the only public statement.

PARAGRAPH 5: PUBLIC STATEMENT

C-15. A PPAG usually contains a statement for public release. PAOs use paragraph 5 in an active PA posture to announce the military activity initially or to respond to queries in an RTQ posture after an operation has commenced. If making a public announcement, this paragraph states who will make the announcement, the method of announcement, the preferred time and date for the announcement, and the rationale for the recommendation. If commanders desire a combined announcement with a host nation or other U.S. Government agency, PAOs include complete details of the methods, time, and procedures in this paragraph. PAOs usually make public statements 1 to 5 days prior to the start of an event. If PAOs intend to make a public statement long before the event begins, they explain why that action is necessary. If the public statement requires multiple paragraphs, PAOs identify each paragraph as a subparagraph of the message. This paragraph explains the time to make the initial announcement, the method (for example, press release, spokesperson, or social media), and the command. The statement should include “(Begin)” at the beginning of the statement and “(End)” at the end of the statement. The last sentence of any statement should identify points of contact or a web address to gather additional information.

PARAGRAPH 6: THEMES AND MESSAGES

C-16. This paragraph lists broad themes and specific messages or talking points to use in support of the operation, exercise, or event. These themes and messages may come from a PA communication strategy or other planning guidance. All communication in support of the PPAG consistently aligns with these themes and messages. Successful PA personnel understand that themes and messages provide guidance and are not expected to be used verbatim. Themes and messages should be concise. If applicable, PAOs specify whether some talking points are restricted for use by specific personnel or commands.

PARAGRAPH 7: QUESTIONS AND ANSWERS

C-17. Questions and answers (often called Q&As) are developed to enable PA personnel to respond to the majority of anticipated questions with a recommended range of the most likely and most difficult or politically sensitive questions expected. PAOs arrange the questions and answers in one paragraph and number them sequentially (for example, Q1, A1; Q2, A2; Q3, A3). Questions and answers are for use in both active PA and RTQ postures. If applicable, PAOs specify which questions and answers are restricted for use by specific personnel or commands.

PARAGRAPH 8: PUBLIC AFFAIRS AND COMMUNICATION PLANNING INSTRUCTIONS AND COMMAND RELATIONSHIPS

C-18. This paragraph defines the approving authority by level of command and procedures for the release or clearance of information. This paragraph indicates if there are other proposed PA activities, considerations, or assumptions and whether this PAG is part of a larger communication strategy involving other elements of

communication. This paragraph provides the timeline of communication delivery and events (such as legislative engagements, local audiences, think tanks, and regional security centers). PAOs include in this paragraph planning information that does not otherwise fit in the PPAG format that may be unique to the individual operation, exercise, or event. Examples include information regarding political sensitivities, media analyses, description of the communication environment, or command PAO recommendations regarding coordination issues. This information is generally not for public release.

PARAGRAPH 9: MEDIA OPERATIONS

C-19. This paragraph explains the rationale on whether owned media (such as professional communicators, COMCAM, American Forces Press Service, American Forces Network) and external media coverage is encouraged or not desired. This section is generally not for public release.

PARAGRAPH 9.1: OWNED MEDIA

C-20. This subparagraph provides instructions on the use of DOD-owned military media; the degree of freedom of movement, including whether escorts are necessary; and the submission and screening of VI materials. PAOs include instructions and information for submissions to the Defense Imagery Management Operations Center (known as DIMOC) and DVIDS. PAOs also specify if host nation-owned media are involved.

PARAGRAPH 9.2: MEDIA INFORMATION CENTERS

C-21. This subparagraph provides instructions on whether centers are single-Service, joint, or combined. It delineates who is responsible to establish the center. It gives a generic description of its composition such as joint PA support element, U.S. Army desk (listing for example, Army major and staff sergeant), or United States Navy or Marine Corps desk (listing for example, Navy commander and Marine Corps sergeant). This paragraph also establishes the center's functions such as coordination of all media and PA activities, clearance of U.S. military-generated news material before release, production of news material for release, and escort of accredited news media representatives. Examples of the various types of media information centers include the Joint Information Bureau, Press Information Centers, and Combined Information Bureau.

PARAGRAPH 9.3: MEDIA EMBEDS OR EMBARKS AND SPACE AVAILABLE TRAVEL

C-22. This subparagraph states whether embeds or embarks are authorized and which command will handle such requests. It lists detailed requirements for news media representatives such as valid passport, working media visa, local accreditation requirements, protective equipment, and funds for food, lodging, and return travel if military air is not available. Additionally, this paragraph provides instructions regarding assistance to continental United States-based units for handling requests from news media for accompanying travel before and following the event. It identifies commanders authorized to provide media transportation on a space available basis. This paragraph provides a chronology of potential events that would be of interest to media. It specifies media ground rules, if established.

PARAGRAPH 9.4: MEDIA OPERATIONS

C-23. Consistent with AR 360-1 and any supporting guidance from the higher headquarters and approving echelons, this subparagraph provides guidance for using digital media, including social media platforms, to inform families and other interested audiences about unit activities in support of military operations. Digital media websites can be a platform on which units create a command or unit presence. This paragraph indicates whether command and individual Service member usage of digital media is encouraged or discouraged to upload photos or post stories; it provides best practice instructions if appropriate. All Service members must remain cognizant of the power of connected media and understand that every word and photo reflects on the United States and its military. Every word and photo should reflect the appropriate tone given the circumstances of the military operation.

PARAGRAPH 10: PUBLIC AFFAIRS POINTS OF CONTACT

C-24. This paragraph lists all relevant point of contact names, phone numbers (Defense Switched Network, commercial, and cell phone if applicable), and email addresses. If applicable, information also includes after-hours contact numbers and email addresses if different from normal duty hours.

PARAGRAPH 11: DECLASSIFICATION INSTRUCTIONS

C-25. This last paragraph describes the declassification instructions in accordance with DODI 5230.09, if required.

**FRAGMENTARY PROPOSED PUBLIC AFFAIRS GUIDANCE
FORMAT AND CONTENT**

C-26. The format and content for a fragmentary PPAG is the same as for a PPAG but may contain less information than a full PPAG submission. PAOs remove the sections not needed or not applicable for the specific fragmentary PPAG submission. They number each paragraph sequentially. At a minimum, a fragmentary PPAG must include the following:

- Classification.
- Subject.
- Background and coordination.
- PA posture.
- Holding and public statements.
- Themes and messages.
- Points of contact.

SUBMISSION PROCEDURES

C-27. All PPAG and fragmentary PPAG email submissions from the commander, through the PAO, to the approving echelon must include an attached document that can be edited as needed. In the text of the email, the commander formally requests echelon approval and specifies the date it is required for use. The email identifies the document as being fully coordinated and theater-approved and lists all commands and agencies that coordinated on the PPAG or fragmentary PPAG. If the document is transmitted to the approving echelon before it is fully coordinated, the submitting command will ensure the approving authority is promptly informed of the results of the remaining coordination. The PPAG or fragmentary PPAG request email includes all coordinating agencies as information addressees. If in doubt about whether to submit PPAG or fragmentary PPAG, commanders or PAOs seek approval through their higher headquarters in coordination with the defense press office (DPO) directorate at the approving authority.

C-28. Most PPAG submissions are CUI and emailed via NIPRNET through a higher echelon PAO to facilitate approval by the ATSD (PA), which allows for fastest interagency coordination. In rare instances, some PPAG requests are classified and require submission to the ATSD (PA) via SECRET Internet Protocol Router Network (SIPRNET) email. All Unclassified/For Official Use Only PPAG submissions submitted by SIPRNET email will be summarily disapproved by the ATSD (PA) and sent back without comment.

C-29. Classified PPAG submissions should always contain an unclassified public statement to respond to query. While the entirety of the PPAG may not be used for the public, an unclassified public statement ensures the public feels informed.

C-30. If applicable, PPAG submissions include an explanation of why a specific date is desired for the initial public announcement. Some submissions are time-reliant, and must not be released until it is deemed acceptable.

C-31. The commander, through the PAO, submits the PPAG via email to the applicable DPO media officer at the ATSD (PA). The commander sends the email as early as possible but no later than 30 days prior to desired initial announcement date. If the PA office does not intend to make an active announcement, then the commander sends the email 30 days prior to the start of an operation, exercise, or event.

ASSISTANT TO THE SECRETARY OF DEFENSE FOR PUBLIC AFFAIRS STAFFING PROCEDURES

C-32. PPAG or fragmentary PPAG requests are assigned to the appropriate media officer from the DPO directorate—usually the media officer who directly supports the submitting DOD component. The media officer then becomes the primary point of contact for the submitting DOD component and is listed under the point of contact (paragraph 10) of the PPAG or fragmentary PPAG.

REVIEW

C-33. The DPO media officer reviews the PPAG or fragmentary PPAG submission to ensure that it is complete and complies with DODI 5405.03. The media officer then determines which DOD or executive level organizations need to review the PPAG, determines an appropriate suspense date for return comments, and requests reviews and comments. The media officer reviews response comments for incorporation into the PPAG. If comments significantly alter the PPAG, the media officer presents the comments to the submitting DOD component and adjudicates any disagreements. If unable to adjudicate disagreements, the DPO media officer elevates the disagreement to the DPO director for resolution or guidance.

APPROVAL OR DISAPPROVAL

C-34. Upon adjudicating and incorporating all the inputs, the DPO media officer prepares a cover memo and submits the final PPAG to the DPO director. The DPO director then recommends approval or disapproval to the Deputy Assistant Secretary of Defense for Media Operations. Upon confirmation of approval, the PPAG becomes official DOD PAG. The DPO media officer emails the PAG to the submitting DOD component and all relevant addresses. If disapproved, the media officer sends the PPAG back to the originator for changes and resubmission for staffing. ATSD (PA) does not issue the PAG via message traffic, but DOD components are authorized to retransmit in message traffic if desired.

Appendix D

Public Affairs Annex

ANNEX FORMAT

D-1. All plans and orders follow the five-paragraph order format. The five specific paragraphs consist of the situation, mission, execution, sustainment, and command and signal. Attachments (annexes, appendixes, tabs, and exhibits) are information management tools added to orders and plans. Attachments also follow the five-paragraph format except matrixes, overlays, and lists. Staffs list attachments under an appropriate heading at the end of the document they expand. For example, they list annexes at the end of the base order. (See FM 6-0 for specifics on writing and formatting annexes.)

SAMPLE ANNEX

D-2. Figure D-1 illustrates Annex J (Public Affairs) to a base plan or order. This figure provides fundamental considerations, formats, and instructions for developing Annex J (Public Affairs) to the base plan or order. Commanders and staffs use Annex J (Public Affairs) to describe how PA supports the concept of operations described in the base plan or order.

[CLASSIFICATION]
<p><i>Place the classification at the top and bottom of every page of the attachments. Place the classification marking at the front of each paragraph and subparagraph in parentheses. Refer to AR 380-5 for classification and release marking instructions.</i></p> <p>Copy ## of ## copies Issuing headquarters Place of issue Date-time group of signature Message reference number</p> <p><i>Include the full heading if attachment is distributed separately from the base order or higher-level attachment.</i></p> <p>ANNEX J (PUBLIC AFFAIRS) TO OPERATION PLAN/ORDER [number] [(code name)]— [(classification of title)]</p> <p>(U) References: <i>List documents essential to understanding the attachment.</i></p> <ul style="list-style-type: none">a. <i>List maps and charts first. Map entries include series number, country, sheet names or numbers, edition, and scale.</i>b. <i>List other references in subparagraphs labeled as shown.</i>c. <i>Doctrinal references for public affairs activities include FM 3-61 and JP 3-61.</i> <p>(U) Time Zone Used Throughout the OPLAN or OPORD: <i>Write the time zone established in the base plan or order.</i></p> <p>(U) Task Organization: <i>Describe the organization of forces available to the issuing headquarters and their command and support relationships. Refer to Annex A (Task Organization) if long or complicated.</i></p> <p>[page number] [CLASSIFICATION]</p>

(U) <u>Assumptions.</u> <i>List any additional assumptions or information not included in the general situation that will impact the public affairs mission.</i></p> <p>2. (U) <u>Mission.</u> <i>State the mission of public affairs in support of the base plan or order.</i></p> <p style="text-align: center;">[page number] [CLASSIFICATION]</p>

Figure D-1. Sample Annex J (Public Affairs) (*continued*)

[CLASSIFICATION]

ANNEX J (PUBLIC AFFAIRS) TO OPERATION PLAN/ORDER [number] [(code name)]—
[(classification of title)]**3. (U) Execution.**

a. (U) Scheme of Public Affairs. *Describe how public affairs supports the commander's intent and concept of operations. Summarize how the commander visualizes executing the public affairs plan. Include public affairs priorities: Intent (access, information, welfare, morale, and will to win), concept (who, where, what, why, and when), specifics (tasks to a subordinate; who is to do what, where, and when, including nonpublic affairs activities), and actions with media (credential, train, and transport).*

(1) (U) Outline of Public Affairs Objectives. *Describe clearly defined public affairs objectives that the commander intends to achieve.*

(2) (U) Outline of Public Affairs Tasks. *Identify and assign supporting public affairs tasks to each objective. Assign specific tasks to elements of the command charged with public affairs tasks. Establish priorities of support for each phase of the operation.*

(b) (U) Tasks to Subordinate Units. *Identify and list public affairs tasks assigned to subordinate units not contained in the base order including maneuver and augmenting public affairs units. Also identify unit public affairs representatives' requirements.*

(c) (U) Coordinating Instructions. *Give details on coordination, task organization, and groupings. List instructions that apply to two or more subordinate elements or units. Refer to supporting appendixes (public affairs running estimate) not referenced elsewhere (public affairs guidance, media in country, media en route with U.S. forces, media contact report, handover checklist, task organization, and public affairs synchronization requirements).*

4. (U) Sustainment. *Identify priorities of sustainment for public affairs key tasks and specific additional instructions as required by the paragraph below. Refer to Annex F (Sustainment) as required.*

a. (U) Logistics. *Use subparagraphs to identify priorities and specific instructions for maintenance, transportation, supply, field services, distribution, contracting, and general engineering support. Outline requirements for establishing a media operations center (if required) and embedded journalists. Refer to Annex F (Sustainment) and Annex P (Host-Nation Support) as required.*

b. (U) Personnel. *Use subparagraphs to identify priorities and specific instructions for human resources support, financial management, legal support, and religious support. Refer to Annex F (Sustainment) as required.*

5. (U) Command and Signal.

a. (U) Command. *State the location of key public affairs leaders (to include media operations center location and public affairs contact information).*

b. (U) Control. *State the public affairs liaison requirements not covered in the base order.*

c. (U) Signal. *Address any public affairs specific communication requirements (such as commercial internet or Defense Visual Information Distribution Systems) and reports. Refer to Annex H (Signal) as required.*

Figure D-1. Sample Annex J (Public Affairs) (*continued*)

Appendix E

Communication Plan

COMMUNICATION PLANNING GUIDANCE

E-1. Communication planning guidance is a method by which senior PA staffs enable subordinate PA staffs to support Army-level communication objectives. PAOs use guidance to publish a communication plan (COMPLAN) at the discretion of senior PA staffs. The guidance helps PAOs complete the COMPLAN. This plan enables senior PA staffs to make clear to subordinate PA staffs the limits necessary for conversations between leaders and media, Soldiers and the public, and through social media. The COMPLAN contains four paragraphs: references, situation analysis, execution, and command and signal.

FORMAT AND CONTENT

E-2. The content contained in a COMPLAN consists of four paragraphs. Paragraph 1 lists references. Paragraph 2 details the situation analysis. Paragraph 3 addresses execution of the plan. The COMPLAN concludes with Paragraph 4 labeled command and signal that contains contact information.

PARAGRAPH 1: REFERENCES

E-3. The first paragraph of a COMPLAN lists overarching and month-specific references and other directives pertinent to the communication planning guidance. Common examples at the Headquarters, Department of the Army level include the Army Vision, and Army Strategy. Common monthly examples include communication synchronization products and monthly communication concept of operations produced by OCPA and at echelon. This paragraph additionally contains references at echelons between the issuing PA staff and OCPA, as deemed necessary by the issuing PA staff. See figure E-1 for Paragraph 1.

1. REFERENCES
<ul style="list-style-type: none">• Overarching: <i>Army Vision; Fiscal Year XX Army Campaign Plan; Army 20XX Strategy; General Order #1</i>• Month-specific: <i>Monthly and quarterly Office of the Chief of Public Affairs Communication Synchronization; December Concept of Operations ; Fiscal Year XX Communications Plan Assessment Framework</i>

Figure E-1. COMPLAN paragraph 1

PARAGRAPH 2: SITUATION ANALYSIS

E-4. Paragraph 2 guides the PAOs to analyze the situation by providing the commander's intent and other relevant information. The situation analysis contains the following sub-paragraphs listed in paragraphs E-5 through E-10. See figure E-2 on page E-2 for Paragraph 2.

Intent

E-5. The commander's intent sub-paragraph is derived from the commander at the issuing echelon. It includes the communication focus and describes ways communication efforts support the higher Army- and communication-centric objectives.

Overarching Chief of Public Affairs Guidance

E-6. This sub-paragraph provides a communication focus and directions for implementation of the COMPLAN. It also identifies pertinent products disseminated by higher headquarters including higher PA directives and other products (for example, the Chief of Public Affairs sends an Army Communication Guidebook).

Expanded Purpose

E-7. This sub-paragraph links the guidance in the Intent subparagraph to long-term communication imperatives. The imperatives can include Title 10 responsibilities and relate to overarching References listed in COMPLAN paragraph 1.

Communication Objectives

E-8. This sub-paragraph lists the desired objectives intended for target audiences to receive and understand, by key message.

Target Audiences

E-9. This sub-paragraph identifies specific audiences for which the Communication Objectives are intended. Target Audiences contains the following sub-paragraphs:

- **Desired Objectives.** Desired Objectives sub-paragraphs follow each target audience. These sub-paragraphs identify tailored versions of Communication Objectives that are intended to resonate most effectively with each target audience. Key messages for each specific target audience are outlined here.
- **Core Opportunities and Key Challenges.** This paragraph contains the following two sub-paragraphs:
 - **Core Opportunities** are events in the external information environment that are conducive to Army messaging and therefore represent opportunities to align Army messaging with the needs of target audiences. Core Opportunities also include Army-driven events likely to result in significant media and public interest, including Army Senior Leader events and major announcements. In total, Core Opportunities are the highest-yield communication opportunities. This paragraph aids subordinate commands and PA staffs in prioritizing their own communication focuses and efforts.
 - **Key Challenges** are events in the area of operations likely to inhibit progress toward Key Opportunities, including competing national events, waxing or waning public interest by topic, and prevailing media narratives and interest.

E-10. **Desired End State.** This paragraph directly nests into communication objectives and target audiences established by higher headquarters PA staffs. It details the logical ties between efforts in COMPLAN and specific, quantifiable progress toward communication objectives.

2. SITUATION ANALYSIS
<ul style="list-style-type: none"> ● Intent: <i>As directed by the Secretary of the Army, the monthly communication focus for December 20XX is Army Values with a theme of "Commitment by All." This is executed through a DAS-directed process as part of the Army Campaign Plan.</i> ● Overarching CPA Guidance: <i>The Army Communication Enterprise will...</i> <i>Public affairs professionals should identify events and opportunities that fall within their organization's area of responsibilities and help amplify the Army Vision and Secretary of the Army's priorities</i>

Figure E-2. COMPLAN paragraph 2

- **Expanded Purpose:**

December presents a number of opportunities to build trust and confidence in the Army as a values-based institution. The Army Communication Enterprise will synchronize resources and efforts to communicate how Soldiers are ready to fight and win our Nation's wars while continuing to treat everyone with dignity and respect. Priority will go toward highlighting service in communities and while deployed, commitment to teamwork, and mutual trust.

- **Communication Objectives:**

- Communicate to the American People and Internal Army audiences that the Army is pursuing initiatives to further strengthen the 'culture of trust.'*
- Communicate the importance of direct leaders to inspire and motivate Soldiers and Army Civilians to embrace a shared identity as trusted professionals.*

- **Target Audiences:**

OCPA has identified two key audiences for the Army to communicate and engage with during the month of December:

- American People*
- Internal Army*

- **Desired Objectives:**

- American People:*
 - Reinforce the Army upholds high standards and values*
- Internal Army:*
 - Communicate that the Army is pursuing initiatives to strengthen the culture of trust further based on dignity and respect.*
 - Communicate that the Army leaders are committed to strengthening a strong professional organizational climate grounded in the Army Values*
- Communicate that it is every Soldier and Army Civilian's responsibility to strengthen the culture of trust and live the Army Values.*

- **Core Opportunities and Key Challenges:**

- Core Opportunities:*
 - The month of December provides opportunities to highlight the Army's commitment to its values: Loyalty, Duty, Respect, Selfless Service, Honor, Integrity, and Personal Courage.*
 - The holiday season, with its focus on family and giving, is a time when most media outlets highlight the contribution of service members with a connection to outlets' communities and the sacrifices of those serving away from their families during the holiday; both deployed and stationed abroad*
 - The end of the year is a reflective period for many Americans. It provides an opportunity to highlight accomplishments the Army has made in the past year to strengthen the culture of trust and strengthening a strong professional organizational climate that exemplifies the Army Values.*
 - Focus Events: Army leaders have approved the Army-Navy Football Game, Holiday Block Leave and the Reagan Defense Forum as focus events that should be the backbone of communicating Army Values this month. Other events that provide significant opportunity for messaging amplification include Army Senior Leader outside the continental United States travel, televised holiday greetings from deployed troops, and Army Band performances. Additionally, the Army is observing the National Guard Birthday on December 13.*
 - Army Senior Leader Events: Army Senior Leaders have several engagements that will amplify this message. This includes attending the Army-Navy Football Game, the Armed Forces Bowl, the Army Community Partnerships Recognition Ceremony, a Pittsburgh Field Band Concert, and they will visit forward-deployed Soldiers.*

Figure E-2. COMPLAN paragraph 2 (continued)

b. Key Challenges:

- 1. The holiday season presents limited time for engagements with condensed schedules and significant leave downgrading the availability of all organizations to perform engagements.*
- 2. Unplanned events or the release of information that detracts from the monthly focus (for example, unforeseen geopolitical issues or crises, political or whistleblower controversies, reports, FOIAs, and misconduct.)*
- 3. Sexual Harassment Assault Response Prevention (SHARP) report.*
- 4. Identifying and coordinating with the appropriate staff.*

c. Desired End State:

- 1. Base on the FY19 Communication Plan Assessment Framework*
- 2. Contribute to the effort to increase awareness by 10 percent among the American People, by XX Sept XXXX that the Army is a values-based organization.*
- 3. Contribute to the effort to increase awareness among Internal Army by 10 percent by XX Sept XXXX that the Army is a Values-based organization that fosters professionalism and trust.*
- d. Reinforce to Congress that the Army is a values-based organization.*

Figure E-2. COMPLAN paragraph 2 (*continued*)**PARAGRAPH 3: EXECUTION**

E-11. The Execution paragraph uses Army operations planning as a baseline format, with modifications for communication-specific guidance. This paragraph contains four sub-paragraphs listed in paragraphs E-12 through E-15. See figure E-3 for paragraph 3.

Concept of Operations

E-12. This sub-paragraph outlines efforts by the concept of operations, with attention to each involved PA staff. The concept of operations follows the plan, prepare, execute, and assess operational framework, with follow-on phases incorporating preparation of an environment for future communications.

Key Tasks

E-13. This sub-paragraph identifies PA staff elements, at the level of command that issues the COMPLAN, and the tasks they must complete to enable the specified Communication Objectives in COMPLAN paragraph 2.

Tasks to Subordinate Units

E-14. This sub-paragraph identifies PA staff elements, at levels of command below the command issuing the COMPLAN, and the tasks they must complete to enable the specified Communication Objectives in COMPLAN paragraph 2. Tasks to Subordinate Units are not authoritative unless published through operational channels. When necessary, senior PA staffs liaise with their respective S-3 or G-3 staffs to publish these tasks formally. When supporting named operations, PA staffs may elect to publish Annex J (Public Affairs) to base operation order, or formal COMPLAN, or both. Command direction and operational guidance are the final determinants of the products used.

Coordinating Instructions

E-15. This sub-paragraph includes reporting requirements and other items deemed necessary by the issuing PA staff. Common elements in this paragraph include guidance for engagement through different types of media, including social media, traditional media, in-person communication, and others. As with Tasks to Subordinate Units, this paragraph is not authoritative unless published through operational channels.

3. EXECUTION

- **Concept of Operations:**

- a. *Phase I- Plan and Prepare*

- 1. *OCA-led efforts*

- i. *OPT-GOSC content development*

- ii. *Council of Colonels*

- 2. *ASL PAO planning efforts*

- i. *Identification and planning for ASL participation in engagements that support the monthly focus.*

- ii. *Organization-led planning efforts*

- iii. *Identification of key events and opportunities that can support the monthly focus*

- b. *Phase II- Execution efforts*

- 1. *Listed organizations will perform the key tasks listed below*

- c. *Phase III- Drumbeat and Assessment*

- 1. *Amplify: All organizations will continuously look for opportunities to amplify the monthly communications focus.*

- 2. *Assessment: OCPA Assessments Division will prepare a final, total all-encompassing assessment report on the Army's communication effort for the month of December. Information for this report will come from all messengers and sensors listed below with key tasks.*

- d. *Phase IV- Prep the battlefield for the next operation.*

- 1. *Identify OPRs for communications products over the next quarter.*

- 2. *Nominate, plan and staff Bugle Call and Bugle Notes for January.*

- **Key Tasks:**

- a. *OCPA Activities*

- 1. *Strategy and Plans Division:*

- i. *SPD will develop a monthly communication plan with input from key offices.*

- ii. *Communication Synchronization Army-wide: To facilitate consistent, synchronized and unified messaging across the U.S. Army, OCPA will publish a CPA Sends at the end of November with the communication strategy specifically drafted for December's communication focus.*

- iii. *Top Line Messages:*

- *The responsibility to defend our nation requires commitment by all – especially leaders – to the Army Values. This includes treating everyone with dignity and respect, collaborating broadly, and always doing the right thing.*

- *Soldiers learn the Army Values – Loyalty, Duty, Respect, Selfless Service, Honor, Integrity and Personal Courage – during basic combat training, and they must live them every day in everything they do.*

- *We embrace and uphold the Army Values and standards of the profession, and we are always accountable to each other and the American People for our decisions and actions.*

- *December Bugle Call with Supporting Bugle Notes:*

- o *Talent Management*

- o *Army Ethics and Values*

- o *Soldier for Life/Commitment to Veterans*

- o *Value of the Army Profession*

- o *Commitment by All*

- o *Call to Service*

- *December Observances:*

- o *National Guard Birthday (XX Dec)*

Figure E-3. COMPLAN paragraph 3

b. Digital Media

1. Develop content to be published on Army.mil and the Army's social media platforms that highlights the Army's Values.
2. Amplify content from other Army organizations highlighting Army Values on the Army's social media accounts.
3. Develop and amplify content for each of the month's focus events (Army-Navy football game, Reagan Defense Forum, Holiday Block Leave, Army Professional Forum, Accessions focus event).
4. Develop a list of hashtags that will be used throughout the month which will identify a post as being tied to Army Values.

c. Outreach:

d. MRD

e. Assessments Division:

1. Will collect information from messengers and sensors on messaging efforts in December.
2. Will analyze this information and provide an overall assessment at the January GOSC.
3. Will develop and refine a framework using this information for the next month that Values are to be highlighted.

f. Tasks to Subordinate Units:

1. According to the FY19 Comms Plan Assessment Framework, the following entities are either messengers or sensors of messaging opportunities and will be tasked appropriately:

i. TRADOC

ii. FORSCOM

iii. ASLs/ASL PAOs

iv. OCPA DMD

v. ASCCs

vi. OCLL

vii. SAFM-BUL

2. Subordinate offices will not be included in the December communications plan, but can be expected to join the process later.

g. Coordinating Instructions:

i. Traditional Media:

- Coordinate and pitch media stories that highlight the Army's high standards and values.

ii. Social Media

- Communicate organization and leader activities as appropriate with OCPA DMD and other Army Organizations.
- Publish content on social media that discusses how the Army holds high standards and values.
- Use the hashtags developed by OCPA DMD in posts that highlight Army Values.

iii. All components listed above will provide an assessment of their task-related activities for December no later than the fifth business day of January (XX Jan). This assessment should consist of the number and type of engagements or attempted engagements, and pertinent information related to each engagement (such as. number of articles published on an engagement or number of executives met with).

Figure E-3. COMPLAN paragraph 3 (*continued*)

PARAGRAPH 4: COMMAND AND SIGNAL

E-16. This paragraph contains contact information for, at a minimum, one point of contact from the issuing PA staff. Best practices are to include points of contact by effort or purpose such as points of contact for assessment, media facilitation, and command information. See figure E-4 for Paragraph 4.

4. COMMAND AND SIGNAL

- **OCA Strategy and Plans Division:**

a. COL ABC DEFF -----@mail.mil; 703-XXX-XXXX

b. Ms. GHI JKLM -----@mail.mil; 703-XXX-XXXX

c. MAJ NOP QRST -----@mail.mil; 703-XXX-XXXX

d. Mr. UVW XYZA -----@mail.mil; 703-XXX-XXXX

- **OCA Assessments Division:**

a. Ms. ZYX WVUT -----@mail.mil; 703-XXX-XXXX

b. LTC SRQ PONM -----@mail.mil; 703-XXX-XXXX

Appendix F

Media Facilitation Products

MEDIA QUERY PROCEDURES

F-1. When PA personnel receive a media query, they use several products to facilitate responses:

- DA Form 7675 (*Media Query*).
- Query Log Book.
- Media briefing checklist.
- Communication goals.

F-2. Media queries usually start with a phone call or a visit from a media representative who wants information. PA personnel complete DA Form 7675 to record the query whether on the phone or in person. See figure F-1 on page F-2 for an example form. Ideally, PA personnel give the media a response as quickly as possible. However, PA personnel should not commit to getting answers within a certain time.

F-3. The Soldier or civilian receiving the query completes DA Form 7675 with clear information. Journalists and PA personnel only answer questions with information that is accurate and cleared for public release. All responses should be free of jargon. PA personnel explain any military terms they use.

F-4. Before personnel release information, the PA commander or the agency with release authority must approve the release. Some information is protected from release by privacy act concerns. When a particular query takes an unusually long time to answer, PA personnel contact the media representative and explain the delay.

MEDIA QUERY

DA FORM 7675, OCT 2010 APD LC v1.00ES

Figure F-1. Sample DA Form 7675

TOOLS

F-5. PA personnel log each query and assign it a local, unit-specific control number. The chief PA escort officer reviews and assigns each query to an action officer or NCO for completion. When the action officer or NCO has completed the query, that officer notes and forwards the response to the chief PA escort officer for review.

F-6. After review by the chief PA escort officer, PA personnel request approval to release the query response. When the PA commander or the agency with release authority approve, PA personnel release a query response. The PA personnel use a control number to file the DA Form 7576 as well as the response.

F-7. Sometimes PA personnel cannot release a response to a question immediately. This occurs in the case of accidents and hospital conditions. In the case of accidents, PA personnel tell reporters that while military police investigate an accident, the PA office cannot release names until next of kin are notified. PA personnel cannot release conditions of patients in the hospital. Hospitals can release patients' conditions. They categorize conditions as treated and released, stable, serious, and critical.

F-8. PA personnel often host a briefing to answer a media query. These are often referred to as press conferences. During the briefing, the public and media are informed when and where the briefing will take place. The commander will provide a command statement and allow open-forum questions.

F-9. To set up for a media briefing, PA personnel need to check that they have the following information and products: basic information, personnel preparation, site preparation, and a sequence plan

F-10. Basic information that PA personnel need to gather includes the following:

- Briefing subject.
- Briefing date.
- Briefing time.
- Speaker.
- Briefing location.

F-11. PA personnel check the following items when they prepare personnel:

- Speaker provided talking points, five good question, and five bad questions.
- Speaker murder board conducted.
- Facilitator selected and briefed.
- Escorts selected and briefed.
- Interpreters selected and briefed.
- Rehearsal conducted.

F-12. PA personnel check following items to ensure the site is prepared:

- Briefing area secure and separated from the tactical operations center.
- Briefing area separated from generators or other noise.
- Briefing area large enough to accommodate anticipated audience with seating.
- Adequate electrical power and outlets for video equipment.
- Sufficient lighting and has been checked and tested.
- Suitable backdrop.
- The following items are on hand (as appropriate):
 - Computer.
 - Lectern.
 - Lighting system.
 - Maps of area of operations.
 - News releases or press packets.
 - Pointer.
 - Projector screen.
 - Projector.

- Public address system.
- Television.
- Video player.
- Visual aids.
- Video camera or digital voice recorder to record briefing.
- Event catered or refreshments provided (as per funding regulations).

F-13. PA personnel check the following for the sequence plan:

- Plan to secure media reception area.
- Plan to search media as they pass through security.
- Plan to escort media into briefing area.
- Ground rules established by facilitator.
- Subject matter experts introduced.
- Questions monitored and ground rules enforced.
- Plan to escort media to reception area when briefing complete.
- After action review completed and forwarded to higher headquarters PA office.

F-14. PA personnel use agreements to clarify limits with the media: the hold harmless agreement and agreement to reimburse. A hold harmless agreement is used in a legal contract, absolving one or both parties of liability for injuries or damages suffered while under contract. It is initiated by the unit and signed by the civilian media personnel. It is maintained by the unit once signed by the civilian media. See figure F-2 for a sample hold harmless agreement.

Hold Harmless Agreement

Release, Indemnification, and Hold Harmless

Agreement not to file suit

1. The United States of America (the “Government”), acting by and through the Department of Defense, believes it to be mutually beneficial to both the Government and news media organizations (“media organizations”) to place selected news media organization employees (“media employees”) with selected military units (“military units”) for the purpose of providing news media coverage before, during, and after military operations. The placement of media employees with military units is referred to in this Agreement as “embedding” or the “embedding process” and will require media employees to live, travel, eat, sleep, and conduct all professional and personal activities with the military unit to which the media employees are “embedded.”

Definitions.

- a. The term “Government” means the United States Government, including its departments, subdivisions, agencies, instrumentalities, officers, employees (including military and civilian personnel), servants, contractors, volunteers, and agents.
 - b. The term “media organization” means the “media employee’s” employer, a registered U.S. or foreign profit or not-for-profit organization, its successors, and assigns.
 - c. The term “media employee” means an employee or agent of a “media organization”, his or her guardians, executors, administrators, heirs, and assigns.
2. Media organizations and media employees understand and agree that the embedding process will expose media employees to the same risks and hazards as those to which the military members of military units are exposed, including the extreme and unpredictable risks of war, combat operations, and combat support operations, as well as common and uncommon hazards of military living. Media organizations and media employees fully understand and appreciate the following:
- a. The embedding process will expose media employees to all hazards of a military environment, including but not limited to the extreme and unpredictable hazards of war, combat operations, and combat support operations. The military environment is inherently dangerous and may result in death or personal injury of media employees or damage to personal property.
 - b. The embedding process may include strenuous and inherently dangerous activities, including transportation in, and close proximity to, military tactical vehicles, aircraft, watercraft, and other Government (and Government contracted) vehicles and may involve substantial risk of serious injury or death as the result of the media employee’s own actions or inaction, the actions or inactions of others including agents, contractors, officers, service members, and employees of the Government, the conditions of the Government facility and the natural environment, the known or unknown condition of any government- furnished equipment, and the inherent dangers of war, combat operations, and combat support operations.
 - c. The embedding process requires media employees to be in overall good physical health and condition. Persons who are not in overall good physical health and condition should not participate in the embedding process. Media employees should consult their physicians prior to embedding to be certain they are qualified to do so. Persons with a history of heart or lung

Figure F-2. Sample hold harmless agreement

disease or conditions, or coronary disease, or other chronic or pervasive diseases or conditions may not participate. Likewise, those women currently pregnant may not participate. Anyone suffering from any injuries, conditions, ailments or pre-existing conditions that could be affected by the embedding process may not participate.

3. As part of the embedding process, the Government will make available anthrax and smallpox vaccinations to media employees, provided it is done at no cost to the Government (full reimbursement of all Government costs) and provided that the media employees sign an additional agreement regarding the risks involved. These vaccinations are voluntary and are not a prerequisite for participating in the embedding process. Media organizations and media employees agree, for those media employees choosing to receive the anthrax and smallpox vaccinations, that this Release, Indemnification, and Hold Harmless Agreement and Agreement Not to Sue specifically includes all risks and hazards associated with the smallpox and anthrax vaccinations, including any negative reactions, adverse effects, including the media employee's illness, infirmity, or death.

4. The media employee agrees to:

a. Participate in the embedding process and to follow the direction and orders of the Government related to such participation. The media employee further agrees to follow Government regulations. The media employee acknowledges that failure to follow any direction, order, regulation, or ground rule may result in the termination of the media employee's participation in the embedding process.

b. Voluntarily, willingly, and knowingly ASSUME ANY AND ALL RISKS, known and unknown, in any way associated with the embedding process, war, combat operations, and combat support operations.

c. RELEASE, INDEMNIFY, AND HOLD HARMLESS the Government from and against any claims, demands, actions, liens, rights, subrogated or contribution interests, debts, liabilities, judgments, costs, and attorney's fees, arising out of, claimed on account of, or in any manner predicated upon the media employee's participation in the embedding process, including any loss or damage to property or the personal injury or death of any person which may occur as a result of the media employee's participation in the embedding process, even where that loss, damage, personal injury, or death is caused or contributed to, in any manner, by the Government.

5. The media organization agrees to permit its media employees to participate in the embedding process. As a condition of being permitted to participate in the embedding process, the media organization agrees to RELEASE, INDEMNIFY, AND HOLD HARMLESS the Government from and against any claims, demands, actions, liens, rights, subrogated or contribution interests, debts, liabilities, judgments, costs, and attorney's fees arising out of, claimed on account of, or in any manner predicated upon the media employee's participation in the embedding process, including any loss or damage to property or the personal injury or death of any person, even where that loss, damage, personal injury, or death is caused or contributed to, in any manner, by the Government.

6. The media organization and media employee hereby covenant and agree they will never institute, prosecute or in any way aid in the institution or prosecution of any demand, claim or suit against the Government for any destruction, loss, or damage to the media organization's property or the media employee's property, or the personal injury or death of media employees which may occur as a result of the media employee's participation in the embedding process.

7. The media organization and media employee grant express, voluntary, and knowing consent to the rendering of all emergency medical or dental treatment that may, in the professional judgment of a Government medical or dental officer, become necessary while participating in the embedding process. Transportation to a definitive Government or commercial care facility may be required as an adjunct to authorized emergency medical or dental care. Persons receiving Government medical

Figure F-2. Sample hold harmless agreement (*continued*)

or dental care who are not otherwise eligible to receive such care shall be obligated to reimburse the Government.

8. The media organization and the media employee understand and agree that the Government may terminate the embedding process at any time and for any reason, as the Government determines appropriate in its sole discretion.

9. This Release, Indemnification, Hold Harmless Agreement, and Agreement Not to Sue shall be interpreted according to federal law. It is to be construed as broadly and inclusively as is permitted by relevant federal law. If any portion of this document is held invalid, the balance shall continue in full force and effect.

Figure F-2. Sample hold harmless agreement (*continued*)

F-15. Like the hold harmless agreement, the agreement to reimburse is provided by the PAO and is signed by the civilian media personnel. This denotes that some military operations they participate in will incur personal costs. Also, if military or government equipment is issued, the signer agrees to pay if items are damaged or lost. See figure F-3 on page F-8 for a sample agreement to reimburse.

AGREEMENT TO REIMBURSE		
<p>1. I understand that covering combat and other military operations may require that I be provided certain items not locally available or convenient due to combat conditions. These items may include but are not limited to: meals, lodging, and air travel into and within the theater of operations.</p> <p>2. Additionally, I may be issued certain items of military equipment such as protective mask, helmet, flak jacket, or load bearing equipment for my personal use while in the area of operations.</p> <p>3. I agree to reimburse the U.S. Government for any items it may provide me while I am in the area of operations, or for the cost of any equipment issued to me which may become lost or damaged.</p> <p>4. I understand that my agreement to this statement is a condition of being credentialed to cover U.S. military operations and receiving assistance for that coverage.</p>

F-16. PA personnel consider Privacy Act implications before releasing information. The purpose is to ensure the government's need to maintain information about individuals with the rights of the individuals is balanced. Service members have the right to certain elements of privacy and need to be protected from unwarranted invasions of their privacy. Table F-1 provides PA personnel a checklist that addresses personal information about Soldiers and any living persons that can or cannot be released under the provisions of the Privacy Act. PA personnel use this checklist to determine whether to information meets reliable standards.

Table F-1. Privacy Act considerations

Information	Releasable or not releasable	Reason
Age (date of birth)	Releasable	This information is public record.
Home of record Present address	Not releasable	The street address cannot be released. In each case, personnel consider the desires of the actual person or next of kin.
	Releasable	There is no general rule for disclosure of this information. Widely different circumstances surround each incident, and judgement is made on a case-by-case basis. In most cases, the home of record can be released. In most cases, the person's present geographical location may be provided (city, state).
Marital status Dependents	Releasable	This information is public record including names, ages, and sex of dependents.
Awards Decorations Citations	Releasable	This information is part of public record
Education Schooling Specialty	Releasable	Major area of study, school, year of graduation, degree and specialty designator are releasable as they are public record.
Race	In most cases, not releasable	This information is considered private unless an individual's race is relevant in providing essential facts to the press (such as in a racially oriented protest or altercation).
Character of discharge	Not releasable	Administrative information is private unless the individual provides his or her written consent.
	Releasable	Punitive information is public record and includes discharges resulting from courts-martial.
Duty status	Releasable	This information is part of public record.
Personnel boards	Not releasable	Results of administrative discharge boards and aviator flight boards.
	Releasable	Results of promotion boards and augmentation boards is public record.
Photographs in the custody of the Department of Defense	Not releasable	Photos of service member remains (flag draped coffins).
	Releasable	Photos that do not infringe on personal privacy

Appendix G

Message Mapping and Interacting with the Media

THE MESSAGE MAP

G-1. Message mapping is a technique to help commanders and their designated spokespeople connect with audiences on key topics using approved, relevant, command-focused messages. It provides a framework to visualize how facts, stories, and context converge to support specific concepts the commander desires to convey to select audiences in support of communication objectives.

G-2. A message map is a template tool used to visualize and process a simple, concise direction for media interviews. With an average video or sound clip diminished to 9–15 seconds, spokespeople must master the art of effectively communicating using succinct, impactful headlines. This one-page tool can assist in the recall and delivery of concise, impactful headlines. Creating a story arc or “dashboard” can help PA personnel sketch an easy way to mentally recall and effectively deliver an intended response.

G-3. Message mapping works best when spokespersons develop and employ it as part of a deliberate, overarching communication strategy. PA personnel can also use it easily for unscheduled engagements if they have enough preparation time. It incorporates critical and creative thinking to describe complex issues and develop shared understanding.

KEY COMPONENTS OF A MESSAGE MAP

G-4. Message maps are composed of interdependent components stitched together to create the command narrative. These key components are:

- Top line messages.
- Concepts.
- Context.
- Facts and stories.
- Vulnerabilities.

G-5. Top line messages are the key, command-approved messages to weave into the narrative during media engagements. Think of these in terms of headlines that bear repeating.

G-6. Themes are ideas that recur or pervade.

G-7. Concepts are abstract ideas or general notions.

G-8. Context is the interrelated conditions surrounding an idea

G-9. Facts and stories are used to support the position and point of view of the spokesperson, the commander, and the organization. Select stories that are personal, human, and dramatic.

G-10. Vulnerabilities are possible exposures to being attacked or harmed

CREATING A MESSAGE MAP

G-11. Creating a message map consists of five general steps. First, develop a central theme for clear direction. This identifies the type of command message that will be given. In figure G-1 on page G-3, the theme addresses who (the U.S. Army), what (is aligned), how (by bringing capability and lethality), and when (by 2028). Some themes address where and why. Each theme is command centric.

G-12. Second, select no more than five simple key concepts. These are one or two words. In figure G-1, the concepts are mission, vision, people, non-deployables, and recruiting. For each concept category, develop

headline messages with solid examples of personal stories or other fact-based evidence to make your message stick.

G-13. Third, nest strategic top-line messages within the plan for optimal results.

G-14. Fourth, open and close with a central theme and top-concept messages.

G-15. Lastly, always define vulnerabilities, and determine how to mitigate them using the dashboard and interview techniques. See figure G-1 for examples of these processes.

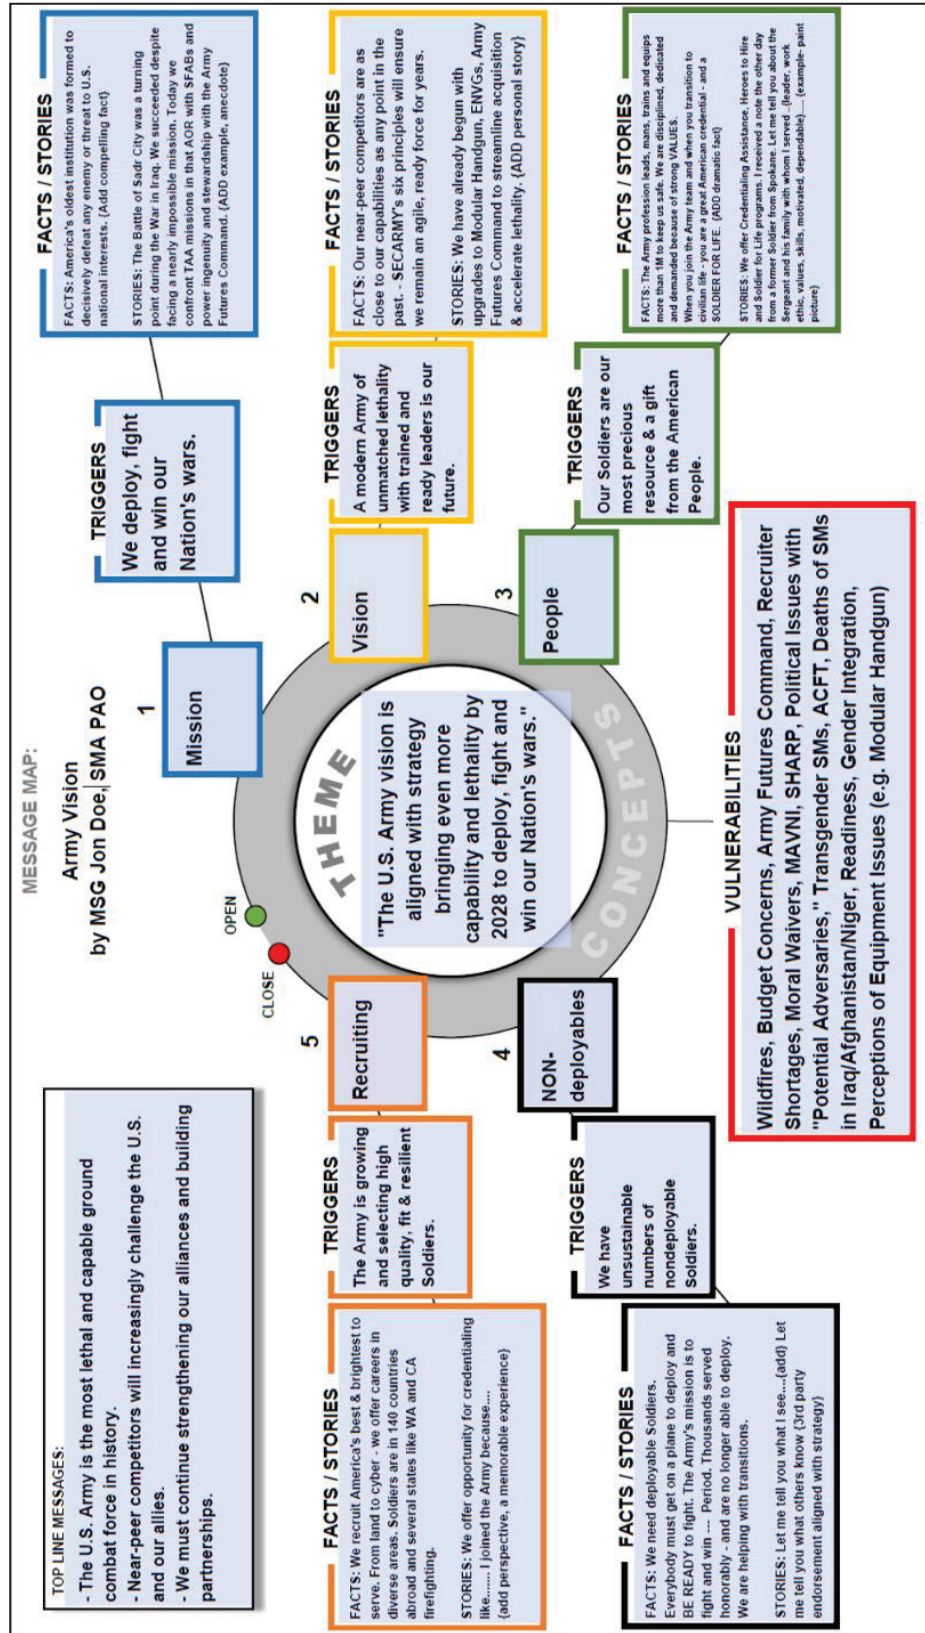

Figure G-1. Sample of message mapping template

PREPARING FOR A MEDIA ENGAGEMENT

G-16. When preparing for a media engagement, PA professionals follow five general rules:

- Prepare mentally.
- Be message driven, not question driven.
- Practice good behavior.
- Expect the unexpected.
- Never let the setting define you; you define the setting.

PREPARE MENTALLY

G-17. PA professionals prepare mentally for engaging with the media. They start by sorting complex facts and emotions to help relax the mind and body. They prepare a message map for a clear mental picture of the communication goal. PA professionals use the message map for mitigating vulnerabilities by having a variety of command messages and statements prepared and on-hand.

BE MESSAGE DRIVEN, NOT QUESTION DRIVEN

G-18. To prepare for a media engagement, PA personnel focus on being driven by the message they are giving. PA personnel have a mental direction and master interview techniques. Interview techniques consist of pausing, repeating, asserting, consistency, headlining, flagging, blocking, bridging, opening, and closing, discussed further in this appendix. PA personnel make verbal and nonverbal messages stick with personal stories, examples, visuals, and anecdotes. For example, if PA staff is asked how successful the mission was, they can respond with their personal positive experiences, pointing out why they viewed it as a success. They avoid Army jargon while clearly understanding the facts, audience, and message. PA personnel use simple words localizing and humanizing strategic messages. They take great care in doing no harm with the engagement.

G-19. Skilled PA personnel master bridging to fit their vernacular. They use the following equation: Response = Answer {bridge} + Message + Story. By using the equation, they can help pivot to the direction they want to take the interview. Generally, PA personnel answer to confirm the obvious {...we have been challenged}; bridge {... what I confidently know is...} to a message {American Soldiers are strong and resilient meeting high standards} with a story {let me tell you about Specialist Jackson}.

G-20. Some media representatives deviate from the approved topic. If their questions are on a hot topic and not associated with the actual agreed-upon topic, the spokesperson acknowledges to confirm the obvious, bridges to a topical message, and moves on. The spokespersons work to be brief and move on. They stay positive and avoid negative words and characterizations. If the media asks five questions on sexual misconduct and the interview goal is about recruiting talent, then the spokesperson has failed to bridge to a topical message and move the conversation in the right direction.

PRACTICE GOOD BEHAVIOR

G-21. PA professionals practice good behavior when engaging with the media. For a spokesperson, communication is behavior—verbal and non-verbal. PA professionals find harmony by sorting complex details in advance. Through their presence and behavior, they can manage others' perceptions of them. PA professionals verbally express their authentic, accountable, and credible messages. When PA personnel communicate nonverbally, they remain aware of others' perceptions. They use their smile appropriately to express happiness. They express anger, fear, contempt, sadness, disgust, and surprise carefully. If while creating a message map PA professionals discover strong emotions such as extreme anger associated with a hot topic, they need to pause. Before they engage with the media, they need to sort through their emotions to prevent an unintended outburst or expression. Skilled spokespersons avoid putting pressure on their body or lips. Such pressure suggests anxiety, tension, and nervousness. They stretch their face and body before an interview as well as practice several times before engagement.

EXPECT THE UNEXPECTED

G-22. To prepare for a media engagement, PA personnel expect the unexpected. They anticipate what reporters will likely ask. PA personnel can mitigate vulnerabilities in advance by knowing the Army's position on current events. They also can minimize hot topics by asserting brief appropriate verbal acknowledgement followed by bridging statements. Skilled spokespersons avoid repeating negative characterizations. When receiving odd or polarizing questions, they use upfront pausing. This means to pause without words for a couple of seconds but to continue natural body flow. Practiced PA personnel take advantage of time and space given in an engagement, even when the media confronts them with tough questions.

NEVER LET THE SETTING DEFINE YOU; YOU DEFINE THE SETTING

G-23. PA professionals never let the setting define them when engaging with the media. Instead, these professional define the setting. They confidently know themselves, their audience, and other variables like the event flow, timing, and room or venue. Skilled spokespersons keep their hands visible and use them to complement words. If seated at a table, they keep their hands on it in a comfortable position. They avoid squeezing their hands and pulling at their cuticles. They also keep their feet on the floor and their eyes on the reporter asking the questions. They stay hydrated with water and avoid banana and milk products before engagements.

PLOTTING A COURSE AND USING DIRECTIONAL PHRASES

G-24. When preparing to interact with the media, PA personnel use their message map to plot a course using directional phrases. Before interacting with the media, skilled spokespersons practice their delivery style. The true PA professional maintains a natural style and tone when confronted with hazards during an interview or engagement. PA personnel know and practice directional phrases that lead them to main points. Plotting these directional phrases helps PA personnel reach their destination through intended messages, facts, and feelings. Plotting the course also involves PA personnel visualizing where they need to go. They see their message map illustrating the central theme, concepts, and facts supporting their goal. They use phrases that fit their vernacular. They practice bridging and keeping detours to a minimum. While conducting the engagement, PA personnel handle the unexpected in a savvy pace, pitch, and tone with prepared directional phrases. Using flagging, blocking, and bridging phrases helps PA personnel smoothly get attention, avoid a topic, and transition to a message. See table G-1 for possible directional phrases to help lead the conversation with a message.

Table G-1. Sample directional phrases

<i>Phrase type</i>	<i>Sample</i>
Flagging phrases (getting their attention):	"Don't lose sight of the fact..."
	"The critical issue to remember is..."
	"The key point to note is..."
	"It all boils down to this..."
Blocking phrases (not going there):	"To go any further would be speculation..."
	"I'm not prepared to talk about that issue today..."
	"My personal opinion is not important, what is key here is..."
Bridging phrases (after answer, before message-transition phrase):	"...Yes/no/I don't know..."
	"Let me put that into perspective..."
	"...What I do know is..."
	"...what's more interesting is that..."

BRIDGING STATEMENTS FOR MEDIA INTERVIEWS

G-25. An important media technique is bridging. Bridging is a technique PA personnel can use to take charge of and control an interview with power. A spokesperson uses a media interview to focus a reporter on a few

key messages that are true, accurate, clear, concise, brief, and memorable. If done well, bridging significantly increases the probability that a spokesperson's key messages will appear in the final news story. By using bridging techniques, a spokesperson can re-focus or re-direct the interview to what is most important, relevant, and critical. See table G-2 for sample bridging statements.

Table G-2. Sample bridging statements

"And as I said before..."	"And if we take a closer look, we would see..."
"And that reminds me..."	"And the one thing that is important to remember is..."
"And what this all means is..."	"And what's most important to know is..."
"And what's most important to remember is..."	"Another thing to remember is..."
"Before we continue, let me emphasize that..."	"Here's the real issue..."
"Before we leave subject, let me add that..."	"However, what is more important to look at is..."
"However, the real issue here is..."	"If we look at the big picture..."
"I think it would be more correct to say..."	"In this context, it is essential that I note..."
"If we take a broader perspective..."	"Let me emphasize again..."
"It's true that...but it is also true that..."	"Let me point out again that..."
"Let me just add to this that..."	"The heart of the matter is..."
"Let me put all this in perspective by saying..."	"This is an important point because..."
"The key here is..."	"What I've said comes down to this..."
"What all this information tells me is..."	"What this all boils down to..."
"What matters most in this situation is..."	"With this in mind, if we look at the bigger picture..."
"While... is important, it is also important to remember..."	"Before we continue, let me take a step back and repeat that..."
"With this in mind, if we take a look back..."	

Appendix H

Public Affairs Professional Development

LEADER DEVELOPMENT

H-1. The Army continuously and progressively develops PA leaders over the span of their entire career. Leader development begins with initial entry education and training. This development continues with job experience and attendance at various schools supplying intermediate- and senior-level educational opportunities. While institutional development is important, a self-development program is necessary to ensure the leader has a well-rounded background that supports the rigors and expectations of leadership. The Army carefully assigns leaders to operational positions key to development as PA leaders. Time in the school environment is limited, so careful consideration of operational assignments and self-development is necessary for effective leader development and career progression.

TRAINING DOMAINS

H-2. Three mutually supporting training domains compose the model the Army uses to develop competent, confident, and professional PA leaders as well as to prepare units for missions with complex communication requirements. Army leader development occurs in the institutional, operational, and self-development training domains. The three domains support PA leader development through education, training, and experience. (See AR 350-1 for a discussion of the training domains.)

INSTITUTIONAL TRAINING DOMAIN

H-3. The PA institutional training domain includes Army schools and centers that provide initial training and subsequent functional and professional military education for Soldiers, military leaders, and DA Civilians. Army institutions provide military training, subsequent military and civilian education, and mobile training teams that can assist in enabling unit readiness. PA institutional training endeavors to train Soldiers, leaders, and DA Civilians to perform critical PA tasks to prescribed standards throughout their careers and to support Army units. The institutional training domain for PA also provides training support products, information, and materials needed by individuals for self-development and by unit leaders for operational training, mission rehearsal, or assessment.

DEFENSE INFORMATION SCHOOL

H-4. PA Soldiers, leaders, and civilians receive initial and developmental training at the DINFOS. This school provides PA-specific, joint education and training in mass communication and VI career fields to meet entry-level skills and long-term career development requirements. DINFOS provides training that qualifies individuals for communication-related MOSs and functional specialties, develops individuals for complex duties in progressively higher positions of responsibility, and targets instruction through mobile training teams in areas requiring specialized functional expertise.

H-5. DINFOS provides two primary training levels of education to develop PA leaders, Soldiers, and DA Civilians: entry-level and continuum. DINFOS offers on-site and via distance learning courses for both levels. PA professionals can find detailed information regarding DINFOS, available PA courses, and training resources at the DINFOS website.

H-6. Entry-level training provides basic PA training to officers and enlisted Soldiers through the following courses:

- Military Communication Foundations Course.
- Public Affairs and Communication Strategy Qualification Course.

H-7. Continuum education provides advanced PA training that focuses on doctrine, principles, techniques, and application of military PA. These courses expose students to advanced PA training. Commanders are highly encouraged to send their PA personnel to these courses, where applicable, during appropriate career stages:

- Content Management Course.
- Joint Contingency Public Affairs Course.
- Joint Intermediate Public Affairs Course.
- Intermediate Photojournalism Course.
- Intermediate Motion Media Course.
- Intermediate Public Affairs Specialist Course.

CYBER CENTER OF EXCELLENCE NCO ACADEMY

H-8. The Cyber Center of Excellence NCO Academy educates, trains, and develops NCOs and leaders. It effectively delivers high quality, innovative, relevant, and diverse professional Army mass communication training in support of the Army's current and future operations. The Cyber Center of Excellence NCO Academy provides two levels of training for Mass Communication NCOs.

- Advanced Leader Course provides leader and specialty training for NCOs in MOS 46S at Skill Level Three (SL3). Training provides students with the skills, knowledge, and technical expertise to provide leadership in coordinating and supervising the employment, operation, and management of a PA section. This course is the required certification course for PA NCOs in MOS 46S30 for the rank of staff sergeant.
- Senior Leader Course provides comprehensive skill level four Army leadership training. It also provides training in the supervision, coordination, and operation of PA for senior PA NCOs in Career Management Field 46. This course is the required certification course for PA NCOs in MOS 46Z40 for the rank of sergeant first class.

OPERATIONAL TRAINING DOMAIN

H-9. The operational training domain involves PA training activities that organizations undertake while at home station, at maneuver combat training centers, during joint exercises, at mobilization centers, and while operationally deployed. This training applies to operating forces and the generating force.

H-10. Leaders schedule and are responsible for PA training activities for organizations, units, and individuals in the operational training domain. Proficiency of their unit, teams, leaders, and subordinates is the responsibility of a leader. Individual and collective PA training activities conducted at home station, regional training centers, and mobilization centers as well as during exercises compose an operational training experience. Major training events, combat training center exercises, and operational deployments deliver comprehensive progressive and sequential PA training for unit and leader development and readiness.

H-11. Operational assignments develop PA units and leaders. The assignment drives specific mission-focused opportunities and conditions for battle-focused training. Operational assignments use and build on fundamental skills, knowledge, and behaviors developed during institutional training. Operational assignments refine individuals and units by developing their knowledge into capabilities that support the mission.

H-12. Mission success requires a well-trained civilian PA workforce to support operating forces and the generating force. Assignments and training that develop DA Civilians provide continuity and specific PA skills essential to Army organizations and programs. PA civilians work at all levels and require opportunities to enhance their knowledge and skills through developmental assignments, civilian education, training, and self-development.

H-13. Commanders expect trained units, leaders, and DA civilians to perform in an operational area and should ensure allotted time for leaders and individuals to prepare for and attend institutional training. A necessary balance of education, institutional training, and experience develops leaders and units to train and win in a complex world.

SELF-DEVELOPMENT TRAINING DOMAIN

H-14. The self-development training domain contains planned, goal-oriented learning that reinforces and expands the depth and breadth of an individual's knowledge base, self-awareness, and situational awareness; complements institutional and operational learning; enhances professional competence; and meets personal objectives. The self-development training domain facilitates the development of PA professionals. In the self-development domain, PA personnel fill gaps their skills, knowledge, and behavior from institutional training and operational assignments.

SELF-DEVELOPMENT TYPES

H-15. AR 350-1 describes three types of self-development: structured self-development, guided self-development, and personal self-development. Structured self-development is learning that continues throughout a career. It closely links to and synchronizes with classroom and on-the-job learning. Guided self-development is recommended but optional learning. It helps prepare personnel for changing technical, functional, and leadership responsibilities throughout their careers. Personal self-development is self-initiated learning in which the individual defines the objective, pace and process. Examples include pursuing a college education, advanced degree programs, and professional certifications.

H-16. The three types of self-development help in identifying, categorizing, and planning for self-development. The three types of self-development assist leaders, subordinates, and self-assessors to identify opportunities for development that may fall under structured, guided, and personal self-development. Combining the three types of self-development better ensures personnel obtain the most comprehensive plan.

H-17. The self-development training domain recognizes that training in Army schools and in operational units often does not meet every individual's need for content or time. Self-development enables individuals to pursue immediate and long-term personal and professional development goals. Leaders and other PA professionals help subordinates identify areas to implement self-development to improve performance. PA personnel have a personal responsibility to develop, grow, and commit to professional excellence.

H-18. Commanders and PA leaders coach, mentor, and counsel subordinates to maximize their self-development as an investment in their future. Successful self-development requires regular self-assessment and performance feedback. An individual development plan (known as an IDP) is important for enlisted, officer, and civilian assessment and feedback. The Army Career Tracker (known as ACT) is a leadership development tool that integrates training and education into one personalized, easy-to-use website. Users can search multiple Army education and training resources, monitor their career development, and receive personalized advice from their supervisor and Army leadership. (See the Army Career Tracker website for developing an individual development plan.)

SELF-DEVELOPMENT RESOURCES

H-19. Resources for self-development can include Army doctrine, joint doctrine, lessons-learned, best practices, professional publications, and books. Awareness of the events in operational and information environments ensures PA leaders focus on timely and relevant information. Army schools provide training and education products that can be used for self-development. The DINFOS provides publicly accessed training resource material. (See the DINFOS website for training products.)

H-20. The Army supports continuing education and self-development. The Army Continuing Education System (known as ACES) mission vigorously promotes lifelong learning opportunities to sharpen the competitive edge of the Army. It provides and manages quality self-development programs and services. Education and training are key elements that mutually support and enhance the combat readiness of the Army. Army Continuing Education System programs and services support leader development and work to expand Soldier skills, knowledge, and behaviors. (See AR 621-5 for more on Army Continuing Education System programs and services.)

BROADENING OPPORTUNITIES

H-21. The Army provides additional opportunities for PA personnel to broaden their education. Some personnel attend civilian academic institutions. Other personnel participate in the Army's Training with

Industry program. The Army authorizes training personnel at civilian institutions full time. Officers, NCOs, and warrant officers can attend full-time education programs (fully and partially funded) in civilian schools, commerce or civilian industries, and Service schools that offer accredited degrees. (See AR 621-1 for details on education.)

H-22. Human Resource Command encourages units to identify officer positions that require an advanced degree for optimum performance of duties. The Army Educational Requirement System requires units to show detailed positions that require thorough and explicit knowledge in an educational or technical field. Army Educational Requirement System positions may be filled by officers or enlisted already possessing graduate degrees (“direct fills”), by those attending advanced civil schooling (ACS), or by those who completed a Training with Industry (TWI) program. Personnel who attend ACS or TWI will incur an active duty service obligation. (See AR 621-1 for more on the Army Educational Requirement System.)

TRAINING WITH INDUSTRY

H-23. The TWI program is a yearlong work-experience program. For PA personnel, it provides extensive in-depth exposure to public relations, marketing, and managerial techniques and industry standards from Fortune 500 companies. It provides military personnel with training and development of skills in the private sector. Often personnel learn procedures and practices not available through existing military programs, ACS, or other established training and professional military education programs.

H-24. TWI is a voluntary program, with an emphasis on placing Soldiers with strong promotion potential and varied PA experiences and assignments into the program. A panel of senior military members select applicants carefully to ensure the most qualified PA Soldiers represent the Army and PA. After completing the TWI program, Soldiers are assigned to an Army Education Requirement System validated position.

ARMY PUBLIC AFFAIRS ADVANCED CIVIL SCHOOLING

H-25. Army PA ACS is a threefold broadening opportunity program. First, it provides outstanding officers and senior NCOs who possess strong promotion potential an opportunity to better understand and appreciate the importance of the strategic relationships among the Army, academic leaders, and industry leaders. Second, it exposes academic and industry leaders to the quality of Army officers and senior NCOs serving in today’s Army. It assists those leaders in learning about the Army as an institution through contact with Army fellows enrolled in the Georgetown University’s Public Relations and Corporate Communications Program. Lastly, PA ACS continues to develop a pool of officers and senior NCOs to serve in challenging and rewarding PA assignments in the PA career field. Selected officers and NCOs pursue an advanced degree at Georgetown University on a full-time basis. Fellows attend school for 18 months. They complete the required degree program and associated curriculum earning a master’s degree in public relations and corporate communications.

Source Notes

This division lists sources by page number. Where material appears in a paragraph, it lists both the page number followed by the paragraph number.

Glossary

The glossary lists acronyms and terms with the Army or joint definitions. Terms for which FM 3-61 is the proponent are marked with an asterisk (*).

SECTION I – ACRONYMS AND ABBREVIATIONS

ACS	advanced civilian schooling
ACTEDS	Army Civilian Training, Education and Development System
ADP	Army doctrine publication
AR	Army regulation
ASCC	Army Service component command
ATSD (PA)	Assistant to the Secretary of Defense for Public Affairs
BOD	broadcast operations detachment
CCS	commander's communication synchronization
COA	course of action
COMCAM	combat camera
COMPLAN	communication plan
COP	common operational picture
CP	career program
CPA	Chief of Public Affairs
DA	Department of the Army
DINFOS	Defense Information School
DOD	Department of Defense
DODD	Department of Defense directive
DODI	Department of Defense instruction
DPO	defense press office
DSCA	defense support of civil authorities
DVIAN	Defense Visual Information Activity Number
DVIDS	Defense Visual Information Distribution System
FEMA	Federal Emergency Management Agency
FM	field manual
FOIA	Freedom of Information Act
IO	information operations
IRC	information-related capability
JDN	joint doctrine note
JP	joint publication
MDMP	military decision-making process
MILDEC	military deception

MISO	military information support operations
MOC	media operations center
MOS	military occupation specialty
MPAD	mobile public affairs detachment
NCO	noncommissioned officer
NGO	nongovernmental organization
NIPRNET	Non-classified Internet Protocol Router Network
OCPA	Office of the Chief of Public Affairs
OE	operational environment
OPSEC	operations security
PA	public affairs
PAD	public affairs detachment
PAG	public affairs guidance
PAO	public affairs officer
PPAG	proposed public affairs guidance
RC	Reserve Component
RTQ	response-to-query
SIPRNET	SECRET Internet Protocol Router Network
SME	subject matter expert
SOF	special operations forces
SOP	standard operating procedure
SRC	standard requirements code
SSRA	spectrum supportability risk assessment
TWI	training with industry
U.S.	United States
USC	United States Code
UPAR	unit public affairs representative
VI	visual information

SECTION II – TERMS

audience

In public affairs, a broadly-defined group that contains stakeholders and/or publics relevant to military operations. (JP 3-61)

combat camera

A specially-trained expeditionary forces from Service-designated units capable of providing high-quality directed visual information during military operations. (JP 3-61)

command information

Communication by a military organization directed to the internal audience that creates an awareness of the organization's goals, informs them of significant developments affecting them and the organization, increases their effectiveness as ambassadors of the organization, and keeps them informed about what is going on in the organization. (JP 3-61)

commander's communication synchronization

A process to coordinate and synchronize narratives, themes, messages, images, operations, and actions to ensure their integrity and consistency to the lowest tactical level across all relevant communication activities. (JP 3-61)

commander's visualization

The mental process of developing situational understanding, determining a desired end state, and envisioning an operational approach by which the force will achieve that end state. (ADP 6-0)

communication

The imparting or interchange of information, thoughts, and opinions by sending themes, messages, and facts through engagements and traditional and digital media platforms to designated audiences. (AR 360-1)

community engagement

Public affairs activities that support the relationship between military and civilian communities. (JP 3-61)

defense support of civil authorities

(DOD) Support provided by U.S. Federal military forces, Department of Defense civilians, Department of Defense contract personnel, Department of Defense component assets, and National Guard forces (When the Secretary of Defense, in coordination with the governors of the affected states, elects and requests to use those forces in Title 32, United States Code, status) in response to requests for assistance from civil authorities for domestic emergencies, law enforcement support, and other domestic activities, or from qualifying entities for special events. (DODD 3025.18)

digital media

Text, audio, and visual information content that can be transmitted over the internet or computer networks. Army PA content that is released on a website, blog, or social media platform will fall into this category. (AR 360-1)

***disinformation**

The deliberate use of incorrect or false information with the intention to deceive or mislead.

external audience

In public affairs, all people who are not United States military members, Department of Defense civilian employees, and their immediate families. (JP 3-61)

information environment

The aggregate of individuals, organizations, and systems that collect, process, disseminate, or act on information. (JP 3-13)

information-related capability

A tool, technique, or activity employed within a dimension of the information environment that can be used to create effects and operationally desirable conditions. (JP 3-13)

internal audience

In public affairs, United States military members, Department of Defense civilian employees, and their immediate families. (JP 3-61)

joint public affairs support element

A deployable unit assigned to assist a joint force commander in developing and training public affairs forces in joint, interagency, and multinational environments. (JP 3-61)

key tasks

Those significant activities the force must perform as a whole to achieve the desired end state. (ADP 6-0)

law of war

That part of international law that regulates the conduct of armed hostilities. (JP 3-84)

local area of public affairs responsibility

That area in which installation PAOs and media representatives maintain routine contact concerning installation activities. (AR 360-1)

media operations center

A facility established by the commander to serve as the focal point for the interface between the military and the media during the conduct of military operations. (JP 3-61)

media pool

A limited number of news media who represent a larger number of news media organizations for purposes of news gathering and sharing of material during a specified activity. (JP 3-61)

***media representatives**

Individual representing civilian radio or television station, newspaper, magazine, periodical, independent blog, or news agency, to gather and report on a newsworthy event.

message

1. Any thought or idea expressed briefly in a plain or secret language and prepared in a form suitable for transmission by any means of communication. (JP 6-0)
2. A narrowly focused communication directed at a specific audience to support a specific theme. (JP 3-61)

military decision-making process

An iterative planning methodology to understand the situation and mission, develop a course of action, and produce an operation plan or order. (ADP 5-0)

mission-essential task

A collective task on which an organization trains to be proficient in its designed capabilities or assigned mission. (FM 7-0)

***misinformation**

A subset of information that includes all incorrect information

mission command

The Army's approach to command and control that empowers subordinate decision making and decentralized execution appropriate to the situation. (ADP 6-0)

monitoring

Continuous observation of conditions relevant to the current operation. (ADP 5-0)

***official information**

Information that is owned by, produced for or by, or is subject to the control of the United States government.

operational environment

A composite of the conditions, circumstances, and influences that affect the employment of capabilities and bear on the decisions of the commander. (JP 3-0)

public

In public affairs, a segment of the population with common attributes to which a military force can tailor its communication. (JP 3-61)

public affairs

Communication activities with external and internal audiences. (JP 3-61)

public affairs assessment

An analysis of the news media and public environments to evaluate the degree of understanding about strategic and operational objectives and military activities and to identify levels of public support. (JP 3-61)

public affairs guidance

Constraints and restraints established by proper authority regarding public communication activities. (JP 3-61)

public information

Within public affairs, information of a military nature, the dissemination of which is consistent with security and approved for public release. (JP 3-61)

release of information

Dissemination of information to the public, which may be initiated by the Army or be in response to an external request. Includes written news releases, still photographs, motion picture films, question and answer interviews, speeches, audio or video tape recordings, articles for publication in printed media or for broadcast by radio or television, and oral responses to queries. (AR 360-1)

rules of engagement

Directives issued by competent military authority that delineate the circumstances and limitations under which United States forces will initiate and/or continue combat engagement with other forces encountered. (JP 3-84)

running estimate

The continuous assessment of the current situation used to determine if the ongoing operation is proceeding according to the commander's intent and if planned future operations are supportable. (ADP 5-0)

security review

The process of reviewing information and products prior to public release to ensure the material will not jeopardize ongoing or future operations. (JP 3-61)

social media

Websites and applications that allow communication and dissemination of information on the internet. (AR 360-1)

stakeholder

In public affairs, an individual or group that is directly impacted by military operations, actions, and/or outcomes, and whose interests positively or negatively motivate them toward action. (JP 3-61)

synchronization

The arrangement of military actions in time, space, and purpose to produce maximum relative combat power at a decisive place and time. (JP 2-0)

targeting

The process of selecting and prioritizing targets and matching the appropriate response to them, considering operational requirements and capabilities. (JP 3-0)

unit public affairs representative

Non-public affairs Soldiers identified to increase public affairs capability across a command. (AR 360-1)

visual information

Various visual media with or without sound that generally includes still and motion photography, audio video recording, graphic arts, and visual presentations. (JP 3-61)

vulnerabilities

Characteristics, motives, or conditions of the target audience that can be used to influence behavior. (FM 3-53)

FOREWORD

Psychological factors are an integral part of all battlefields. Each unit movement and every conquest of terrain psychologically affect the battlefield participants and an audience of friendly, neutral, or hostile groups. The psychological effect of combat actions can be seen in the heightened morale of a successful unit or in the discouragement and fear of a defeated unit. Properly manipulated attitudes can modify the behavior and the combat effectiveness of the soldier and the unit.

This manual provides information and guidance for the conduct of psychological operations (PSYOP) in general, limited, and cold war. The doctrine, techniques, and procedures found herein are applicable to conventional warfare, unconventional warfare (UW), and foreign internal defense (FID) operations. This manual should be used in conjunction with other official manuals and publications that provide staff organization procedures and guidance for doctrine, field operations, and maintenance of equipment.

This manual is divided into two parts:

Part One is an easy-to-read, ready reference for the combat commander and tells what psychological operations can do and how they can be used to achieve a quicker victory, conserve valuable resources, and save the lives of US and friendly personnel.

Part Two is for the PSYOP commander, unit, and staff personnel and others with an interest in or need for the details of psychological operations.

Definitions of PSYOP basic terms are in appendix H.

Users of this manual are encouraged to submit comments and to recommend changes for its improvement. Comments/recommendations should be keyed to the specific page and line of text and be fully explained. Forward your comments to the **Commandant, US Army Institute for Military Assistance, ATTN: ATSU-TD-TS, Fort Bragg, NC 28307.**

The use of the pronouns "he," "his," "himself," etc., in this manual includes both masculine and feminine genders. Any exception to this will be so noted.

PART ONE

PSYCHOLOGICAL OPERATIONS AND THE COMBAT COMMANDER

Chapter One

1

INTRODUCTION

Psychological operations used for the purpose of creating a favorable image, gaining adherents, and undermining opponents have become a major weapon of 20th century warfare.

BACKGROUND

MAJOR PSYOP EFFORTS SINCE WORLD WAR II

Since World War II, the major PSYOP effort of the United States has been by the Department of State (STATE); subsequently, the United States Information Agency (USIA) which included the Voice of America (VOA); and now the International Communication Agency (ICA) which replaced USIA.

During the Korean conflict, organization and techniques for tactical PSYOP improved. In the Vietnam action, much PSYOP activity was initiated, emphasized, and refined.

The Joint United States Public Affairs Office (JUSPAO) was created by the National Security Council (NSC) in 1965 to centralize PSYOP policy and insure control of PSYOP activities in Vietnam. Formed at the counselor level in the Embassy, this joint office included representatives from civilian and military US Government agencies. In addition to carrying out the normal mission of the United States Information Service (USIS), the JUSPAO provided PSYOP policy and direction to the US and Free World Assistance Forces in the Republic of Vietnam (RVN).

To insure unity of effort, PSYOP plans of the United States and Vietnam were coordinated at the national level (US Embassy and Government of Vietnam). Coordinating committees were also formed at the region and province level.

As the result of the adoption of a central manager concept (centralized guidance and decentralized execution), all policy stemmed from one source--JUSPAO at the Embassy--with operational discretion permitted at lower levels of command.

Technical advances which increased the PSYOP potential included:

Standardized propaganda developed by JUSPAO was available to tactical units by air delivery to major distribution points.

Printing facilities out of country produced mass printings of leaflets and newspapers.

Master catalogs of themes were distributed. (Upon request, these themes were made into leaflets.)

Television was first used as an instrument of strategic propaganda.

A small adapter named "Early Word" made it possible for airborne transmission of PSYOP appeals directly through an aircraft-mounted loudspeaker system. A radio signal received by the aircraft could be simultaneously taped in the aircraft for further replay.

Tactical limitations depended only on the range of the ground transmitter and the enemy air defense system.

Support to tactical operations was modernized. Loudspeaker support was readily available to ground commanders who could easily adapt themes to their particular situation (i.e., search and destroy operations, among others).

PSYOP TODAY

Today US Army Reserve (USAR) PSYOP units furnish PSYOP support and expertise to the active army. Several Army commands have established mutual support agreements with specific USAR units to augment active army units for combat.

PSYOP RESPONSIBILITIES

THE ARMED SERVICES

Each of the military services provides forces to accomplish its assigned PSYOP mission. Although the US Army has the principal US military PSYOP capability, other services can support the PSYOP efforts. Coordination among all military services and government agencies is required to insure unity of effort, uniformity of policy, and adequacy of coverage.

JOINT CHIEFS OF STAFF (JCS)

The Joint Chiefs of Staff serve as advisers and military staff in the operational chain of command for unified and specified commands. They provide a channel of communications for the President and Secretary of Defense to unified and specified commands, and coordinate all communications in matters of joint interest addressed to these commands. Under this authority, US Army PSYOP forces assigned to theater army or corps in times of crises or during a state of hostilities are placed under operational control or in support of the commander of the unified command. Through the JCS or the unified command, US Army PSYOP units may be tasked to assist other US military or civilian agencies.

DEPARTMENT OF THE ARMY

Department of the Army develops PSYOP resources to support general, limited, cold war, and foreign internal defense. In DA, the Deputy Chief of Staff for Military Operations

(DCSOPS) has staff responsibility for PSYOP. US Army PSYOP resources include command and staff personnel, units, advisers, and equipment. The flow of PSYOP policy from the Chief Executive to the US Army elements is depicted in figure 1-1.

DEPARTMENT OF THE NAVY

Although the Department of the Navy does not have forces dedicated to PSYOP, it can support psychological operations with conventional forces and equipment.

OTHER SUPPORT

Other government and private agencies can assist and cooperate in PSYOP activities, particularly during foreign internal defense operations. Private organizations engaged in education, health, disaster relief, cultural, and missionary work can be of great assistance.

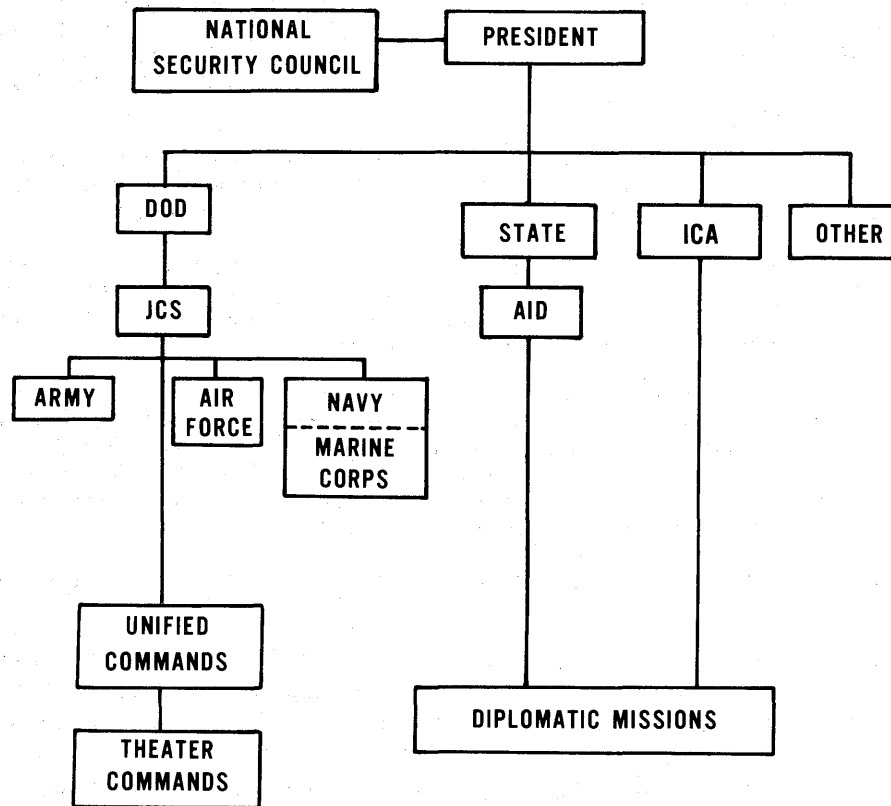

FIGURE 1-1
PSYCHOLOGICAL OPERATIONS POLICY FLOW

UNITED STATES INFORMATION AGENCY (USIA)

In 1953 the USIA was established as an independent arm of the Government's Executive Branch, and most of the functions previously vested in the Secretary of State were transferred to the Director, USIA. Later acts expanded the duties and responsibilities of USIA. Title V, Section 501, Public Law 402, designated the USIA as the agency responsible for the preparation and dissemination abroad of information about the United States, its people and its policies, through press, publications, radio, motion pictures, and other information centers and instructors abroad. Thus, the USIA was the foreign information arm of the US Government, particularly in time of peace. As a part of its mission, the USIA aimed to:

Promote understanding, acceptance, and respect among foreign audiences for the United States and its policies.

Advise the President, his representatives abroad, and the various departments and agencies of government on public attitudes in other countries and their implications on the formulation and execution of foreign policy.

INTERNATIONAL COMMUNICATIONS AGENCY (ICA)

On 1 April 1978, the International Communications Agency was established. It consolidates the functions of the United States Information Agency and the State Department's Bureau of Education and Cultural Affairs. The core management of ICA consists of a Director, a Deputy Director, and four Associate Directors, with designated responsibilities for broadcasting (VOA), programs (PGM), educational and cultural affairs (ECA), and management (MGT).

The internal structure of the Voice of America remains essentially unchanged, but the elevation of the VOA Director gives recognition to the importance of the broadcasting service and is intended to preserve the integrity of its news operation.

The operations of the two other media elements--Press and Publications, and Motion Pictures and Television--come under the direction of the Associate Director of Programs. International exhibits, which have been shown principally in the Soviet Union and Eastern Europe, are a separate element in the same division.

In the new structure for educational and cultural exchange, a major objective is to provide clear lines of responsibility for enhancing, on the one hand, foreign access to American experiences and, on the other hand, American access to foreign experiences and culture.

Aside from the White House, ICA's relationships are primarily with the Departments of State and Defense and the Agency for International Development:

It acts in an advisory capacity toward STATE, and in turn, receives foreign policy guidance.

It works closely with DOD, particularly with the Offices of the Secretary for Public Affairs and of International Security Affairs. By agreement, ICA and DOD exchange liaison personnel at the national level and at joint commands. ICA advises on the impact of overseas public statement and actions in the defense field and cooperates directly with DOD in Washington and major commands abroad to increase support for US policies.

The Agency for International Development, under the supervision and guidance of STATE, administers economic aid abroad. ICA supports the AID mission by publicizing AID programs and accomplishments. Conversely, AID accomplishments reinforce ICA efforts.

Chapter Two

PSYOP RESPONSIBILITIES OF THE ARMY

Psychological operations derive their major effectiveness from being an integral part of a total operation. **They are neither a substitute for power nor a panacea.** When skillfully and closely integrated with actions and other instruments of power, PSYOP act as a catalyst and can often make the difference between success and failure in military operations. Psychological operations can be effectively employed throughout the entire spectrum of conflict.

THE ARMY PSYOP ROLE

Within DOD, the Army--because of its established psychological operations training base, assigned missions, and land-based operations--has the primary military role in PSYOP. As the service with the principal assets, the Army has the major role in assisting commanders of joint task forces and unified, specified, and combined commands to achieve PSYOP objectives.

The Army develops PSYOP resources to operate in general, limited, and cold war. In the field PSYOP elements are responsible for:

Planning and conducting PSYOP in support of military operations.

Developing in all Army personnel an appreciation of the role and value of PSYOP and an understanding of the psychological implications of military operations.

Planning and conducting PSYOP to support US national objectives abroad.

Interallied PSYOP policy is determined at the highest levels of government and command. At combined levels, PSYOP may be guided by standardization agreements; e.g., NATO. Where operational control of designated US Army PSYOP forces is transferred to allied commanders, directives governing the use of US PSYOP forces and equipment will be provided to the appropriate commanders.

Psychological operations are conducted by military forces under the operational control of the theater or unified command. The Army PSYOP element is commanded by the theater Army commander. PSYOP support may be initiated by PSYOP units in either CONUS or at an in-theater site, normally outside of the combat zone. Operations may be conducted concurrently from both areas. When initiated in CONUS, the theater commander provides input for the development of appropriate programs.

THE ARMY PSYOP MISSION

The Army PSYOP mission is to support US national policy; to conduct PSYOP in support of military operations; to be prepared to conduct PSYOP unilaterally in support of, or in coordination with, other military services and US Government agencies; and to give PSYOP training, advice, and assistance to US forces and friendly nations.

Specifically, Army PSYOP forces:

Assist in formulating PSYOP doctrine, tactics, techniques, and operations of Army forces, other US military services, unified commands, and other US Government agencies.

Develop Active Army and Reserve Component (RC) forces to support plans and operations of Army forces, other US military services, unified commands, and other US Government agencies.

Undertake research and development programs to further the Army's capabilities for PSYOP.

Furnish PSYOP-qualified personnel for liaison and military training teams (MTTs).

Must be prepared to conduct these operations unilaterally in support of, or in coordination with, other military services and US Government agencies.

Must be prepared to provide equipment and area-oriented, language-qualified PSYOP personnel to train, advise, and assist allied/friendly nations in developing their PSYOP capabilities; and must be prepared to provide PSYOP assistance in support of the operations of a host country.

Provide information and generate intelligence for PSYOP.

Develop, procure, issue, and stockpile PSYOP materiel and equipment; must be prepared to provide logistical support to US Government agencies and allied/friendly nations.

Conduct PSYOP training for members of all branches of the US Armed Forces and personnel from friendly/allied nations on a mission basis.

LIMITED WAR

Limited war, with its complex and unwritten national policy objectives, is merely an active continuum of cold war. PSYOP, therefore, require a continuation of policy and execution with a broadening of psychological objectives.

The International Communication Agency (ICA) country plan and theater military plans must be coordinated under the guidance of the US Ambassador; and the psychological operator, the policy advisor, planner, and executor, must have an "up-to-the-minute" knowledge of these plans.

GENERAL WAR

If cold or limited war progresses to general war, the US Army PSYOP elements may be required to increase their PSYOP activities. This may include use of organic equipment and facilities to replace damaged or destroyed civilian mass communications equipment and facilities.

The role of US Army PSYOP in general war is established by National Security Council (NSC) directives channeled through the Department of Defense to the Department of the Army. The role is further defined and coordinated by interagency agreements.

PURPOSE OF PSYOP

The purpose of all psychological operations is to create in foreign groups the emotions, attitudes, or behavior to support the achievement of national objectives. In this endeavor, PSYOP influence policy, decisions, the ability to govern, the ability to command, the will to fight, the will to obey, and the will to support.

Psychological operations can increase the relative combat power of friendly forces and adversely affect the combat power of the enemy. This is accomplished, basically, by attacking the identified weaknesses of the opposing forces through a planned and coordinated PSYOP campaign.

PSYOP field teams are placed in direct support (DS) of the maneuver elements and travel with them to exploit opportunities as they arise. The forward teams provide a constant flow of information to the PSYOP command element at the higher headquarters. The PSYOP unit constantly updates the PSYOP estimate, keeps the commander informed of the psychological impact of the operation, and makes recommendations for the conduct of combat operations.

As the attack progresses, the bypassed, isolated enemy elements are targeted by the field teams. The field teams use all available media to induce their surrender, thereby conserving the combat resources of the attacking force.

Tactical deception plans are supported by using misleading sound effects and by disseminating misinformation. During this time PSYOP support can enable the maneuver commander to concentrate his maneuver units while giving the appearance of maintaining normal dispersion. Operations, such as the feint or ruse, are primarily psychological since the intent is to confuse the enemy and have him react in a desired manner.

Planners, operators, and intelligence personnel require access to all available intelligence that pertains to their mission and area of operations. Effective reporting channels are necessary to insure that the flow of information reaches the PSYOP unit on a timely, uninterrupted basis.

PRINCIPLES OF EMPLOYMENT

Offensive Operations

The mission, enemy, terrain, weather, populace, and availability of troops influence PSYOP support.

PSYOP effectively support combat power.

Under certain conditions, offensive operations are conducted for their psychological impact.

PSYOP exploit the effects of friendly nuclear fires.

PSYOP increase the psychological impact of conventional operations.

PSYOP support subordinate units by facilitating exploitation of targets of opportunity.

PSYOP are coordinated with higher and adjacent units when the effects are expected to influence enemy actions outside of the unit's boundaries.

PSYOP are coordinated with the tactical fire support elements in the operational area to enhance the effectiveness of both systems.

PSYOP support tactical deception operations and other facets of the OPSEC program.

Defensive Operations

PSYOP units supporting combat units in the defense continue to maintain a PSYOP offensive. The defensive situation provides an excellent opportunity to establish credibility by factual news reporting. PSYOP missions in support of the defense include those required to:

- Prepare to resume the offense.
- Discourage an enemy offensive.
- Support forces delaying an enemy advance.
- Support the planning and conduct of counterattacks.
- Support rear area protection operations.
- Conduct PSYOP against bypassed and isolated enemy units in rear areas.
- Support tactical deception operations and other facets of the OPSEC program.

Retrograde Operations

Retrograde operations are characterized by limited offensive, defensive, and delaying tactics. PSYOP teams with heavy printing, broadcasting, and other relatively immobile equipment positioned well to the rear are able to provide uninterrupted support. PSYOP are able to support retrograde operations by:

- Publicizing civilian control measures.
- Supporting tactical deception operations and other facets of the OPSEC program.
- Exploiting the psychological effects of nuclear and nonnuclear firepower.
- Supporting counterattacks by placing emphasis on the large number of enemy casualties.

Relief Operations

PSYOP will:

- Support tactical operations and other facets of the OPSEC program.
- Remain in place to support the incoming unit.
- During a forward passage of the lines, support the attacking unit.
- During a rearward passage of the lines, remain with the covering forces.

Support of Other Types of Tactical Operations

When supporting other types of tactical operations, the basic PSYOP principles apply; however, the techniques and manner of application may vary.

Civil Affairs

PSYOP support civil affairs in offensive, defensive, retrograde, relief, and consolidation operations.

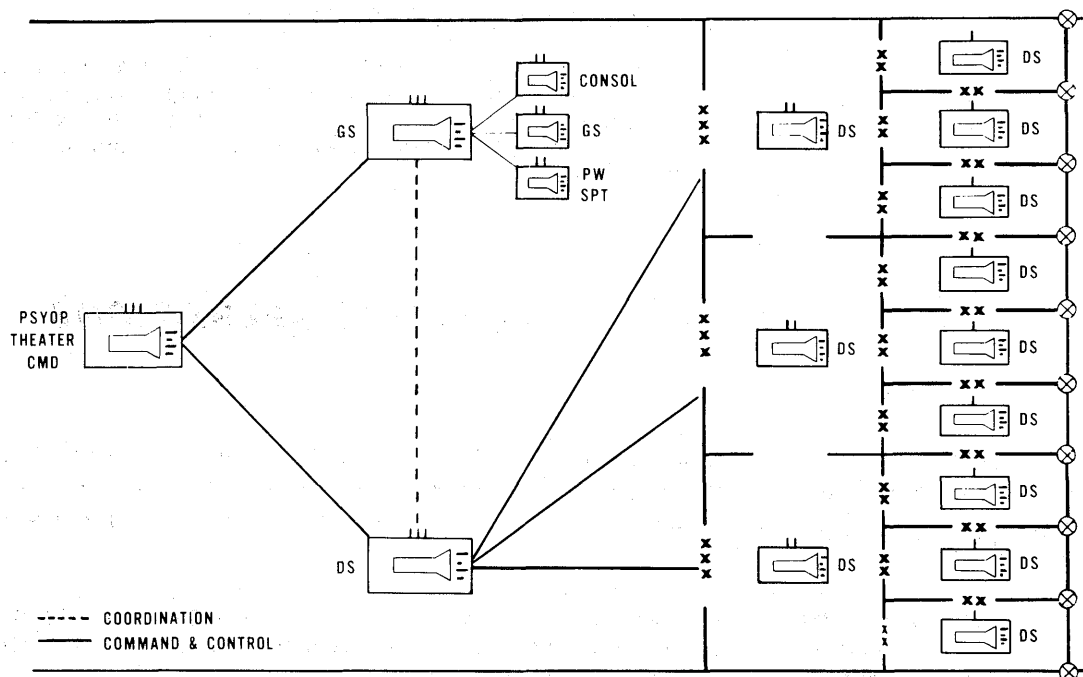

FIGURE 2-1
PSYOP SUPPORT OF A THEATER

TYPES OF PSYOP SUPPORT

Psychological operations support is type-classified according to the level of employment, location, and the physical scope of the operation. The classifications overlap. There are no clear-cut lines as to where support stops for one type operation and begins for another. A PSYOP unit may support all types of operations simultaneously. The three major classifications are:

STRATEGIC SUPPORT

Psychological operations in support of strategic operations are designed to exploit vulnerabilities in foreign military forces and populations. They are designed to **advance broad or long-term objectives**. General support (GS) forces are generally used in this role.

TACTICAL SUPPORT

Psychological operations in support of tactical operations are planned and conducted in the combat area to **achieve immediate and short-term objectives**. Normally, direct support (DS) PSYOP units are used.

CONSOLIDATION SUPPORT

PSYOP supporting consolidation operations assist in the reorientation and education of the civilian population in liberated or occupied areas. The purpose is to **facilitate military operations and obtain maximum cooperation of the inhabitants**.

PSYOP IN SUPPORT OF STRATEGIC OPERATIONS

Psychological operations in support of strategic operations are directed at large segments of the target nation's population. These psychological operations exploit economic, military, sociological, psychological, and political vulnerabilities. They are an integral part of the overall strategic scheme.

PSYOP policies and objectives are approved at the national level. Effective interagency coordination is established at all levels of government and command to insure that no conflicts exist between military PSYOP and other government activities.

Guidance for the support of strategic operations usually emanates from the National Command Authority (NCA). Psychological operations are coordinated with general strategic plans and are directed against forces, people, or areas in their entirety.

Psychological operations supporting strategic operations are normally conducted in support of the unified or specified commands. The unified command issues directives to implement the national policy and establish command policy. These operations are not limited to the area of influence of individual subordinate commanders.

Planning is a continuing process. PSYOP personnel continually evaluate the results of current operations, update current plans, and continue long-range planning to insure adequate support for future operations. Contingency plans and supporting pretested propaganda are prepared and held ready for implementation on order. It is during the planning phase that the psychological impact of a contemplated course of action must be considered. (See chapter 12, Psychological Operations Planning, for more detailed information.)

MAJOR OBJECTIVES

- Deter enemy forces from initiating hostilities or intervening in existing conflicts.
- Create concern in the enemy concerning the futility of war.
- Arouse public concern, political, and economic pressures for or against a military operation.
- Stimulate dissension among enemy rival power groups.

OTHER OBJECTIVES

- Project a favorable image of the United States.
- Foster understanding and gain acceptance of US goals and operations.
- Convince the target that the United States can fulfill its aspirations.
- Explain US policies and objectives to allied, friendly, and neutral nations.
- Strengthen determination of friends and allies.
- Build confidence of allies in the objectives of the alliance.
- Gain support of neutrals.
- Support resistance personnel.
- Gain support in liberated areas.
- Strengthen friendly leaders; weaken enemy leaders.
- Influence enemy strategy and tactics:
 - Identify and exploit enemy weaknesses.
 - Develop modifications in the character and policies of the enemy to favor the United States.
- Stress enemy racial and religious intolerance.
- Publicize and exploit enemy, racial, ethnic, and religious prejudices and intolerance.
- Build or create enemy political disunity.
- Stimulate support of opposition elements of the enemy.
- Undermine confidence in enemy leadership and war aims.
- Interfere with control systems and communications.
- Support and foster economic and other nonviolent sanctions against the enemy military forces and civilians.
- Encourage disaffection in enemy nations among religious, ethnic, social, political, economic, and other elements.
- Support tactical operations.

CONDITIONS THAT MAY BE EXPLOITED

Military successes of friendly forces.

Shortages of food, housing, clothing, or other necessities in enemy territory or enemy-occupied areas.

Enemy manpower shortages.

Enemy country inflation.

Unequal and exorbitant taxation by the enemy government.

Lack of resources to support the enemy economy and war programs.

Enemy police state practices to include terrorism, midnight arrests, travel restrictions, and censorship.

MEDIA

The most desirable media for strategic operations are radio, television, and leaflets.

PSYOP IN SUPPORT OF TACTICAL OPERATIONS

Psychological operations are an integral and coordinated part of the overall tactical plan. They provide the tactical commander with an additional weapons system, a system that can weaken the enemy soldier's will to fight, thereby reducing his combat effectiveness, and that can prevent civilian interference with military operations. They are designed to exploit individual and group susceptibilities.

Psychological operations in support of tactical operations are planned and executed for specific operations. Targets of opportunity are exploited as they arise.

The theater Army commander, in addition to providing resources to the theater commander to conduct PSYOP in support of theater plans, provides PSYOP resources to support tactical commanders, civil affairs operations, and rear area protection.

CORPS SUPPORT

The PSYOP resources available at corps include staff officers and direct support units required to plan, develop, and execute psychological operations. The corps PSYOP staff officer, with his knowledge of the tactical operations, may be called on to provide specific recommendations to be included in theater plans.

Each corps is normally supported by a direct support battalion. The divisions, separate brigades, and regiments are normally supported by a direct support company from the corps direct support battalion. When limited PSYOP units are available, the combat elements may be supported by specific teams tailored to fit the mission.

DIVISION SUPPORT

The direct support mission of PSYOP units is to provide close, continuous, and priority support to the division and its maneuver elements; these units remain under the centralized control of the higher PSYOP commander.

The division is supported by a direct support PSYOP company consisting of a command and control team (AA); command assessment (AD); supply and maintenance (BA); propaganda development (FA); current intelligence (FC); light printing (GA); platoon headquarters, audio and visual (HA); loudspeakers (HB); and an audiovisual team (HC).

Support During Movement to Contact

During movement into a hostile area, the AD team deploys into a hostile area and analyzes and evaluates the psychological warfare possibilities to:

- Make recommendations to the ground force commander in the area of PSYOP.

- Determine what psychological functional teams should be deployed into the area.

- Evaluate the results of any psychological campaign that had been conducted prior to insertion.

- Plan the use of themes in a PSYOP campaign.

During movement to contact with enemy forces, psychological operations also focus priorities to:

- Provide a detailed and systematic examination of processed intelligence to identify and locate target audiences, identify conditions, pinpoint vulnerabilities, establish objectives, and obtain pertinent information to guide PSYOP exploitation.

- Advise on the psychological implications of planned and executed courses of action.

- Assist in tactical deception operations to support OPSEC.

- Give information and directions to friendly elements operating in the enemy combat area.

- Assure exploitation of PSYOP targets of opportunity.

- Evaluate enemy PSYOP efforts to identify psychological weaknesses, friendly and enemy.

- Promote support for short-intermediate-and long-term US and allied goals:

 - Create a favorable image of US and allied soldiers and leaders. Help control friendly and enemy civilians in the combat area.

 - Counter enemy propaganda (if appropriate) and retain the psychological initiative.

 - Support the strategic PSYOP mission by furnishing detailed and timely information of local vulnerabilities and susceptibilities for use in strategic plans and operations of the division commander's higher headquarters.

Assist in rear area protection to:

Gain the willing, active cooperation of the populace.

Strengthen friendly leaders; weaken enemy leaders.

Support in the Attack

In the attack the PSYOP direct support company uses its propaganda development and dissemination capability to lower enemy morale and efficiency by:

Inducing attitudes of futility and defeatism in the enemy.

Inducing the enemy to defeat/surrender.

Assisting in tactical deception operations to support OPSEC and other measures to confuse the enemy.

Exploiting the psychological effectiveness of US and friendly firepower.

Support During the Exploitation

When the division enters the exploitation phase of the offense, the PSYOP direct support company can:

Provide PSYOP support to subordinate units to facilitate exploitation of targets of opportunity.

Identify and locate new target audiences, identify conditions, pinpoint vulnerabilities, establish new objectives, and obtain pertinent information to guide PSYOP exploitation.

Conduct PSYOP against bypassed and isolated enemy units in rear areas.

The success of the division's pursuit can be magnified by the ability of the PSYOP direct support company to:

Facilitate the occupation of enemy areas by delivering ultimatums and defect/surrender appeals and directions.

Lower enemy morale and efficiency by emphasizing:

Numerous enemy defeats and high casualties.

Lack of civilian support.

Heavy and effective artillery and air bombardment.

Insufficient or inferior enemy supplies and equipment.

Precarious enemy situation.

Inexperienced or unqualified leadership.

Excessive periods of hardship.

Lack of medical supplies and treatment facilities for enemy sick and wounded.

The forcing of enemy minority groups into combat.

The enemy draft into its combat forces of the overaged, underaged, physically unfit, inexperienced, and totally untrained personnel.

Support in the Defense

To support the division commander in the defense, the PSYOP direct support company can utilize printing, loudspeaker, and audiovisual equipment and call in radio, guided by personnel skilled in current intelligence and propaganda development, to:

- Support forces delaying an enemy advance by tactical deception operations to support OPSEC.

- Support rear area protection operations:

 - Gain the willing, active support of the population.

 - Strengthen friendly leaders; weaken enemy leaders.

 - Breed uncertainty in enemy troops.

- Influence enemy strategy and tactics:

 - Arouse public opinion and foment political and economic pressures against enemy operations and in favor of friendly forces.

 - Stimulate support of opposition elements to the enemy, particularly those within its territory.

 - Lower the morale and efficiency of enemy military forces and civilians by encouraging disaffection among religious, ethnic, social, political, economic, and other potentially dissident elements.

 - Advise on the psychological implications of planned and executed courses of action.

- Identify and locate target audiences, identify conditions and pinpoint vulnerabilities, establish new objectives, and obtain pertinent information to guide PSYOP exploitation.

- Evaluate enemy PSYOP efforts to identify psychological weaknesses, both friendly and enemy.

Support in the Retrograde

During retrograde operations, PSYOP teams (using heavy printing presses, radio transmitters, appropriately positioned, as well as semimobile equipment, and highly mobile loudspeaker teams) are able to provide uninterrupted support to the division commander.

Support During Delaying Action

In the delay the PSYOP direct support company supports tactical deception operations in support of OPSEC by disseminating information that supports or confirms the tactical operation and its objectives.

Support in the Withdrawal or Retirement

During withdrawal and retirement, the PSYOP direct support company focuses its attention on:

- Publicizing civilian support measures.

- Exploiting the psychological effects of US and friendly firepower.

Supporting tactical deception operations.

Supporting counterattacks by identifying and locating target audiences, identifying conditions, pinpointing vulnerabilities, establishing new objectives, and obtaining pertinent information to guide exploitation by psychological operations.

PSYOP IN SUPPORT OF JOINT TASK FORCE (JTF) OPERATIONS

A PSYOP battalion under the operational control of the joint task force (JTF) commander is adequate to support a JTF provided the JTF strength is not greater than that of a corps. As a minimum, the following teams are recommended:

AB (Command and Control Battalion)

FA (Propaganda)

FC (Current Intelligence)

FD (Research and Analysis)

GA (Light Printing)

Others may be added if the situation dictates. When the JTF is larger than a corps, an augmented PSYOP battalion or possibly two battalions are required.

THE JTF PSYOP STAFF OFFICER

The greatest efficiency and effectiveness can be gained by having the PSYOP battalion commander serve in the dual role of JTF PSYOP staff officer and PSYOP battalion commander, except when operating with an amphibious JTF. In this case, with the JTF Headquarters operating from aboard ship, the PSYOP battalion executive officer should remain aboard and serve as the JTF PSYOP staff officer. The PSYOP battalion commander could then exercise command and control of his troops while operating with the senior ground force commander.

THE PSYOP STAFF OFFICER AND THE J2/J3 OPERATIONS CENTER

It is also desirable that the JTF PSYOP staff officer function as a part of the J2/J3 Operations Center, regardless of the joint staff section under which he is assigned on the Joint Table of Distribution (JTD). This can serve as a highly effective method of integrating psychological operations into both intelligence and tactical functions and operations.

To serve as the JTF PSYOP staff officer is a full-time job requiring complete concentration on and dedication to psychological operations. Therefore, it is recommended that the officer filling this position not be called upon or tasked to perform duties other than PSYOP. (See USREDCOM Manual 525-4.)

PSYOP IN SUPPORT OF CONSOLIDATION OPERATIONS

Consolidation operations are those operations directed toward populations in either liberated or occupied areas to facilitate military operations and promote maximum cooperation with the liberating or occupying power. They are a responsibility of the theater commander. The theater Army commander is assigned the task of administering and rehabilitating occupied or liberated territory.

The psychological objectives vary with the area, the population, and the mission of the supported civil affairs unit. The primary objectives are to:

- Obtain support for military operations.

- Orient and reeducate the population in accordance with command policies, objectives, and missions.

ORGANIZATION

If the Theater Army Area Command (TAACOM) covers a large area, it may be subdivided for ease of control. Corps commanders conduct consolidation operations in their areas of responsibility with resources provided by the theater Army.

PSYOP units supporting consolidation operations are placed under the operational control of the Civil Affairs command support units. They supplement organic civil affairs elements, such as civil information sections or teams. Special purpose PSYOP units composed of the K-series consolidation teams (shown in table of organization and equipment (TOE 33-500H) are normally assigned the mission of supporting consolidation operations. These teams are organized to:

- Conduct PSYOP through mass media and face-to-face communications.

- Supervise or advise indigenous personnel on the use of PSYOP through local communications media.

- Provide PSYOP support for rear area protection operations and civil defense.

SPECIFIC CONSIDERATIONS

The following factors must be considered in planning and conducting consolidation operations:

Continuity

Psychological operations in liberated and occupied areas are carried out as a unified, continuously evolving program from the time the area is occupied to the time the military occupation ceases. The plans for PSYOP in support of consolidation operations are prepared as early as possible--the overall plan, prior to occupation; subordinate plans, as soon as the tactical situation permits.

Consistency with Postwar Aims

Consolidation operations planning must be consistent with postwar aims. The PSYOP planner must avoid making commitments for short-term gains that may not fit long-term policies.

Relation to the US Information Program

Consolidation operations must be correlated with the US Government's information program and must follow directives guiding that program.

Relation with Friendly Underground

Every effort should be made to obtain the cooperation of friendly governments-in-exile and friendly guerrilla and resistance organizations in order to coordinate all PSYOP programs being implemented. This will help to eliminate counterproductive PSYOP and to achieve common objectives effectively and efficiently.

OPERATIONAL SUPPORT

PSYOP resources are used to transmit information and directives to the population. However, there are fundamental differences affecting consolidation operations in liberated and occupied territories. In liberated areas psychological operations tend to be persuasive whereas in occupied areas they may be arbitrary and directive. The demands of combat and the need for control, however, may require that people in both areas be treated alike.

Liberated Areas

US activities in liberated areas will be governed by the military situation, US policy, and international and interallied agreements. Agreements will normally require that US forces not target the inhabitants of liberated areas with PSYOP beyond the period of time dictated by military need. The agreements may include a proviso that US forces train, advise, and assist the friendly government and its forces. In these circumstances US PSYOP elements will not actively engage in PSYOP directed towards the indigenous population in the friendly territory. US Army PSYOP doctrine, techniques, and procedures will be used as a basis for advising, training, and assisting the friendly government or its forces.

Occupied Areas

In occupied areas PSYOP assist in implementing civilian reeducation and reorientation programs. The process of eradicating unacceptable ideological practices and influences continues throughout the occupation.

PSYOP ASSISTANCE

Whether implemented by US PSYOP elements, the host country government and its forces, or other allies, PSYOP can assist the commander in the following ways:

Establishing Law, Order, and Discipline

Organization of populated areas involves the judicious use of propaganda designed to calm the fears of the populace, prevent aimless panicky movement, and direct their activities into useful channels. PSYOP help to create a state of mind conducive to the establishment of law and order by conditioning the population to willingly accept imposed controls and restrictions. This reduces the number of troops required for population pacification and control.

Securing Lines of Communication

Modern warfare requires force mobility. It is essential to keep main lines of communication open for the flow of military forces, equipment, fuel, and other supplies.

Control of Refugees, Evacuees, and Displaced Persons

Refugees, evacuees, and displaced persons frequently clog military arteries, hindering the movement of combat units and equipment. By publishing and broadcasting information and instructions, PSYOP units assist the area commander in keeping his lines of communication and supply open.

Marshaling Labor

PSYOP units, under civil affairs direction, assist in publicizing labor needs among the civilian population and directing potential workers to appropriate labor offices.

Intelligence

Through close contact with friendly and hostile persons, PSYOP personnel gain information of value to the G2/S2 (to include intelligence and counterintelligence programs) and the PSYOP effort. It is important that PSYOP personnel insure that such information is placed in intelligence channels. PSYOP also develop and disseminate appeals to the population encouraging them to report information on enemy activities.

Rumor Control

Psychological state of inhabitants in a combat zone makes them vulnerable to rumors which may stimulate undesired actions (or inactivity) that may interfere with combat operations. Rumors must be countered with a timely, accurate, and well-managed information program.

ORIENTATION AND REEDUCATION

The second major objective of PSYOP supporting consolidation operations is the orientation and reeducation of the population. Under policy guidance and direction from higher headquarters, PSYOP personnel advise and assist in the preparation of plans, programs, and operations to indoctrinate and reeducate the local population in areas under US and allied control.

The objective of these programs is to develop understanding and favorable attitudes in the local population toward our military forces, gain local support for the military effort, and aid in the accomplishment of all allied aims and objectives.

Orientation and reeducation of the population begins as early as possible and may run concurrently with the combat support mission. These programs are assisted by publicizing activities which benefit the population and by explaining US and allied intentions vis-a-vis the liberated or occupied areas.

In both liberated and occupied areas this involves eradicating doctrines and practices hostile to US objectives and eliminating the influence of individuals and groups identified with hostile doctrine. This continues throughout the period of occupation. One of the major tools of orientation and reeducation is psychological actions.

US PSYOP elements will not activate or implement PSYOP against an indigenous population when US, allied, or host country agreements prohibit such activities.

These actions, intended to influence the actions and attitudes of the target, can be effectively employed in conjunction with propaganda and information programs. Combined, the effectiveness of each is increased. Planned psychological actions properly publicized are more effective than the word alone.

OTHER PSYOP OBJECTIVES IN CONSOLIDATION OPERATIONS

In consolidation operations, there are a number of objectives other than orientation and reeducation that do not involve the dissemination of propaganda:

Search for Media and Personnel

PSYOP personnel may be called upon to assist in locating indigenous communications media, equipment, supplies, and personnel. Equally important is locating key communicators and influence groups within the society.

Dissemination of News

The people of liberated or occupied areas must be kept informed. Credible information transmitted by press, radio, and television is useful for political indoctrination under an orientation and reeducation program. PSYOP elements may assist in this program.

Collect Information

Much information obtained from local people is valuable in evaluating the "temper" and attitudes of the populace. This information will help to determine the nature and content of the consolidation PSYOP program.

Gain Willing Cooperation

Intimidation stemming from the presence of strong military forces may temper hostility and make the populace more responsive to authoritative direction. Positive, well-publicized psychological measures (actions and propaganda) must be taken to transfer intimidation into long-lasting, willing cooperation.

In occupied or liberated areas feelings of inferiority will often be found among minority groups who, because of race, religion, ethnic background, or socioeconomic status, have humbled themselves for a long time. Thus, they may tend to offer little resistance to propaganda. Advantage should be taken of this situation to gain the assistance of this target group.

In an area recently subjected to total war, civilians are generally in a state of shock, weary, and apathetic. This often renders them unable to resist authority, thus easing control through PSYOP.

In a newly liberated or occupied area a normal characteristic of civilians is to depend upon the occupying power because it supplies vital goods and services. For reasons of self-interest, therefore, these people may be willing to assist the propagandist.

Make The Military Situation Known

Knowledge of the favorable military situation of the occupying forces tends to make the civilian population more cooperative. PSYOP can and should be used to exploit this tendency.

Capitalize on Existing Habits

People are accustomed to receiving news and information through specific, well-known, and established sources and media. They more readily believe and follow information and directives received through these sources and media. The consolidation propagandist capitalizes on these existing habits by using familiar sources, media, formats, and style.

OBSTACLES

Some conditions which may hinder consolidation operations are:

Resentment Against Occupying Forces

Antipathy toward occupying forces may cause resistance in the form of disruptive behavior, even rebellion.

Ideological Differences

The consolidation propagandist may find himself dealing with staunch adherents to ideologies hostile to his own. In conquered territory these hostile ideologies may stimulate the formation of resistance groups; in liberated areas, dissident elements may undermine the occupation. To be effective, the propagandist must understand existing ideological differences. Then he must develop his campaign to deal with the realities of the situation.

Military Misconduct

Occupation forces who lack dedication and understanding of their mission often engage in acts that discourage cooperation by the people. To eliminate misconduct and improve understanding of the mission, the individual soldier must be oriented toward attainment of the mission objectives. His actions and attitude must win the favor of the people.

Although PSYOP cannot be directed at US personnel, PSYOP personnel may make commanders aware of specific tension-producing conduct and the reasons for the public attitude.

Devastation and Disruption of Communications

Consolidation operations depend upon communication. When communications are destroyed or disrupted, informing and controlling civilian populations become difficult. Due mainly to the lack of current information on the situation, disrupted communications affect face-to-face communication as well as mechanical forms such as radio and newspaper. PSYOP units with their equipment and expertise may alleviate the problems caused by disrupted facilities and installations.

Enemy Propaganda

Although forced from the area, the enemy may continue to direct propaganda toward the population, holding some members and perhaps gaining new adherents to his cause. PSYOP personnel are a vital force in countering the effects of enemy propaganda. The best program is one that combines propaganda of the word with propaganda of the deed.

Attitudes

The initial consolidation effort is perhaps the most difficult since the attitudes of the population may not be fully known. Understanding these attitudes helps the operator in planning consolidation operations and increases the potential effectiveness of the operations. These attitudes can be uncovered by target analysis. The following attitudes should be examined.

Attitudes toward occupying forces. Liberated populations normally have more friendly attitudes toward the liberating forces than occupied-area populations have for the occupying forces. The propagandist must ascertain the tenor and intensity of the attitudes of the population to deal effectively with them.

Attitudes toward accepting discipline or control. People accustomed to totalitarian methods may respond favorably to authoritarian controls. Those familiar with a democratic way of life may require persuasion rather than discipline.

Attitudes shaped by proximity of the enemy. When enemy forces are located relatively near occupied or liberated areas, the population will fear their possible return and give minimal cooperation to consolidation operations authorities. On the other hand, if the enemy is remote and unlikely to return, both friendly and hostile persons are more likely to cooperate in the consolidation effort.

Attitudes based on enemy propaganda. In liberated and occupied areas the enemy will seek to advance his own ideology through intensive propaganda. The consolidation propagandist must ascertain the source and effectiveness of enemy propaganda so that he can make his own more effective.

Attitudes created by organized resistance groups. When organized resistance groups exist in liberated or occupied areas, their presence and actions against occupying forces greatly influence the population.

PROPAGANDA IN CONSOLIDATION OPERATIONS

The same principles and techniques discussed elsewhere in this manual apply for the conduct of PSYOP in support of consolidation operations. The attitudes and environment of the target audience must be analyzed before a psychological campaign can begin. Themes and messages must be credible and easily understood, and the target audience must be given reasonable courses of action. Many themes can be developed based on the present situation and designed to pursue specific objectives.

News

News is valuable to support consolidation propaganda objectives. Local news of the military occupation and the progress of the war and world news on political, educational, religious, economic, and scientific matters are relevant and are of increasing interest to the population.

Themes in Liberated Areas

In liberated areas consolidation units primarily use themes concerning the aims of the United States and its allies, emphasizing unity.

Themes in Occupied Areas

In occupied areas consolidation operations may stress the theme that the old order has been replaced and that for their own best interest the people should cooperate with the occupying forces.

Entertainment

In either liberated or occupied areas consolidation units can provide entertainment, such as motion pictures, to people lacking such diversion due to the devastation of war. Whether pure entertainment is presented or mixed with messages, any momentary relief from the realities of the situation will aid greatly in obtaining the cooperation of the people and in creating an atmosphere within which progress toward US objectives can be achieved.

PSYOP IN SUPPORT OF REAR AREA SECURITY

The duties of US PSYOP elements in friendly rear areas generally consist of supporting military or politico-military activities in other areas. Except when required for security or to accomplish the military mission, PSYOP will not be aimed at the indigenous population. Under no circumstances will US PSYOP staffs or units undertake any campaigns, programs, or other activities that will infringe upon the sovereignty of the host country over its populace or lessen such ties between the host country and its populace.

The delineated role of PSYOP units in friendly rear areas must be meticulously adhered to. To avoid embarrassing the US Government or jeopardizing the host country's position with its populace, US PSYOP units will strictly adhere to proper channels in implementing requests for advice, training, or assistance.

Chapter Three

3

PSYOP RELATIONSHIP WITH COMMAND AND STAFF FUNCTIONS

Psychological considerations and operations--basic components of all military activities and operations--are command responsibilities. They are factors to be included in the planning and execution of all military activities and operations. In fact, psychological objectives may be more important than physical objectives in some instances. Tactical operations can be conducted for psychological reasons as well as physical objectives.

CONTENTS

	PAGE
Commander	3-2
Staff	3-2

3

COMMANDER

The commander provides PSYOP guidance consistent with policy received from command authority. His command responsibilities include:

Assessing the psychological impact of the military presence, activities, and operations.

Integrating PSYOP with other politico-military activities and operations.

Planning and conducting operations and activities to achieve specific psychological objectives. This must be done even though he does not have PSYOP personnel to assist him.

Supervising, guiding, and directing his staff to insure that:

Essential PSYOP objectives inherent in the unit mission are identified.

Subordinate commanders and staff officers are provided guidance concerning PSYOP objectives and plans.

PSYOP staff responsibilities are assigned.

PSYOP staff personnel are fully integrated into all intelligence and operations staff activities.

All subordinate commanders and staff personnel are alert for PSYOP targets of opportunity and other situations where PSYOP will help to achieve the unit mission.

A PSYOP training program emphasizing the vital responsibilities of the individual soldier in influencing the opinions, attitudes, and behavior of others is integrated with all instruction and training.

PSYOP elements in exercises are encouraged to simulate and distribute friendly and aggressor propaganda.

PSYOP field teams are used in field training exercises (FTXs) so that they may gain valuable field experience.

STAFF

At joint levels, psychological operations are governed by joint publications.

The **Joint Chiefs of Staff** have the responsibility to:

Plan for the conduct of PSYOP.

Furnish PSYOP advice and assistance to allies, and assist other US agencies.

Formulate joint PSYOP doctrine and specific policies for joint PSYOP.

Provide intelligence support for PSYOP.

Coordinate PSYOP matters with civil affairs, public affairs, and other related activities.

Through commanders of unified and specified commands, plan and conduct combined PSYOP with allied governments and international commands.

Assistant Chief of Staff, G5, Civil-Military Operations (CMO) Officer is the principal staff assistant to the commander in all psychological, ideological, political, economic, and social aspects of military operations. He is also responsible for the PSYOP techniques used to support the command objectives. The CMO has the following PSYOP-related functions:

Advises, assists, coordinates, and makes recommendations concerning civil-military operations, to include the psychological aspects of proposed operations.

Responsible for the preparation of the PSYOP Estimate of the Situation. (See appendix D and appendix E, PSYOP Annex/Appendix to the Operations Order.)

Provides technical advice and assists in the development of educational programs for prisoners of war.

Maintains close, continuing relations with other US agencies having PSYOP responsibilities.

Coordinates with all personnel, units, and agencies to assure that the PSYOP effort is integrated and adheres to policy.

Exercises staff supervision over PSYOP units that are attached or under the operational control of the command.

Evaluates enemy PSYOP efforts to identify psychological weaknesses and to measure the effectiveness of friendly propaganda.

Uses the knowledge and expertise of his PSYOP staff officer to achieve psychological objectives.

Coordinates the acquisition of local resources--equipment, material, expendables, and personnel.

Assures that civil affairs and PSYOP units mutually support each other.

For additional details, see FM 101-5 and FM 41-10.

The Psychological Operations Staff Officer works under the G5/S5, CMO officer at corps and below. If there is no G5/S5 in a unit, he works under the G3/S3. Above corps level, PSYOP activities are managed by a separate PSYOP staff officer. At theater headquarters, the PSYOP staff officer has the responsibility to:

Develop theater PSYOP policy.

Develop long-range PSYOP plans.

Advise on the PSYOP implications of planned and executed courses of action.

Prepare and coordinate PSYOP requests and estimates.

Develop plans, orders, and campaigns to support the following activities and operations:

- Combat--conventional and unconventional warfare.

- Foreign internal defense (FID).

- Civil affairs--rear area protection.

- Civil internee and PW programs.

- Any action involving the military presence, activities, or operations.

Evaluate enemy PSYOP efforts to identify PSYOP weaknesses and to measure the effectiveness of friendly propaganda.

Exercise staff supervision to assure execution of the commander's directives.

Assure exploitation of psychological operations opportunities.

Coordinate PSYOP intelligence needs and collect reports (including raw field reports), information, and intelligence from various sources. Some sources are G2/S2 reports; PSYOP personnel in the field; the media--press, radio, TV, etc.; professional politicians and political scientists; cultural anthropologists; sociologists; historians and historical documents; the "man in the street"; battle reports; government, business, social, and labor leaders; soldiers of all ranks; captured and interned enemy military and civilian personnel; refugees; etc.

Furnish the information/intelligence to the G2/S2 to insure integration of the PSYOP and combat efforts.

Use the PSYOP Automated Management Information System (PAMIS). (See chapter 15.)

Coordinate the development, update, and use of basic PSYOP studies (BPS).

Circulate information, area studies, and research papers.

Assist the CMO in preparing PSYOP estimates. (See chapter 15 and appendix D.)

Coordinate the analysis of effectiveness of PSYOP campaigns, themes, messages.

Train, advise, and assist friendly PSYOP personnel.

Coordinate the PSYOP aspects of tactical deception operations.

Psychological Operations Intelligence Personnel should maintain liaison with the G2/S2 office of the supported unit. Liaison with the G2/S2 is vital because PSYOP planners and operational units must have immediate, detailed, PSYOP-relevant intelligence if they are to operate effectively. PSYOP personnel may assist in interrogations, make known the intelligence needs of supporting PSYOP teams, and extract intelligence for PSYOP use.

Chapter Four

METHODS OF EMPLOYMENT

Support responsibilities of PSYOP units are designated by the assignment of missions by the force commander (higher authority) on the recommendation of the PSYOP force commander (the Theater PSYOP Group Commander) and of the ACoS, G5, or G3/S3 if there is no G5/S5. A subordinate PSYOP unit commander has the authority to issue to his subordinate elements orders that are necessary to accomplish his assigned mission. This includes task organization and assignment of missions, provided this does not reduce the degree of control retained by the commander who originally assigned the mission.

Psychological operations units may be assigned general support (GS) or direct support (DS) missions or both. When so employed, the supported unit furnishes common facilities and items (i.e., messing, paper, ammunition, etc.). PSYOP units may also be assigned or attached to military commands.

A cellular organization, which has been augmented from other TOEs, is the most practical for PSYOP units to perform their various support missions, whether they be strategic, tactical, consolidation, or others.

PSYOP MISSION

The PSYOP unit mission may be general or specific. The mission statement is the restated mission determined by the PSYOP commander's mission analysis. **Each mission must be clearly defined and not so broad as to be meaningless.**

The PSYOP unit mission normally is to support a force or other commander or commanders. It is given in orders and instructions from higher authority, or it may be deduced from knowledge of the situation and of the intent of the supported commander.

When paragraph 1 of the Estimate of the Situation gives a PSYOP unit a general mission of supporting a force commander, the commander of the PSYOP unit includes the course of action of the supported command, or commands, if known.

Specific missions should normally be within the general support mission. A specific mission may be contained in orders or instructions from higher authority, normally the force commander being supported, or it might be arrived at from knowledge of the situation and intent of the supported force commander. (See FM 101-5, Sequence of Actions in Making and Executing Decisions and Combat Service Support Commander's Estimate of the Situation.)

CONTROL AND COORDINATION

It is likely that a number of agencies will be engaged in PSYOP within a theater of operations, including those representing countries other than the United States. Unless control of all PSYOP is centralized within one body, under a single command, duplication of effort, contradictory propaganda, propaganda contrary to national policy, and propaganda of more use to the enemy than the United States and its allies will result. The net result will be confusion and ineffectiveness.

No less important is close coordination at all levels, from the highest to the lowest. It is of the utmost importance at the tactical operating levels. For not only may uncoordinated PSYOP activities result in an unnecessary duplication of effort, they may also be contraindicated and, at best, confusing.

STAFF CHANNELS

Employment of PSYOP units may not be standard within a theater of operations due to the situation, which may be different in various areas or zones. There should, however, be a continuous and uniform staff channel from the highest level down to the lowest unit to insure an integrated and coordinated PSYOP effort and to avoid a confusing network of cross-channel communications.

GENERAL SUPPORT (GS)

A PSYOP element in general support supports an entire force and not any specific subordinate unit or subdivision. Units with this mission remain under the control of the PSYOP force commander and provide the force commander with a means to direct the PSYOP effort in his area of influence.

DIRECT SUPPORT (DS)

A PSYOP element assigned a direct support mission provides close, continuous support to a specific maneuver element or other force. A PSYOP unit with a direct support mission remains under the command of the higher PSYOP commander. It responds directly and gives priority to requests of the supported unit. The DS PSYOP unit is responsible for establishing liaison and communication with the supported unit.

ASSIGNED OR ATTACHED

PSYOP units may be assigned or attached to military commands or civil-military agencies. Assigned PSYOP units are under the command, control, and administration of the commander of the unit to which they are assigned. Attached PSYOP units and elements are subject to limitations imposed by the attachment order. The commander of the receiving unit exercises the same degree of control over the attached PSYOP element that he does over units or persons organic to his command. Responsibility for transfer and promotion of personnel, however, is retained by the parent PSYOP unit commander. Attachment is usually maintained for the duration of a mission or task.

CELLULAR ORGANIZATION

PSYOP units, organized under the cellular TOE 33-500 series, are tailored to perform missions that may be given to any command. The use of cellular teams permits balanced units to be formed with minimal personnel and administrative procedures. This type of unit may add or delete teams

without affecting its organic structure or requiring unit redesignation. (See appendix B for team designations, capabilities, basis of allocation, and mobility.)

AUGMENTATION

The TOE 33-500 series provides for augmentation with cellular teams from other TOE for administration, mess, signal, and medical services. The TOE has no provision for PSYOP unit personnel to augment corps or division staffs. The chief or commander of the supporting PSYOP team or unit can, however, fill the dual roles of commander and staff officer.

USE OF LOCAL RESOURCES

Psychological operations units, for practical reasons, make maximum use of local resources. In addition to economic advantages, the use of local resources, when given voluntarily, gives the local population a vested interest in the operation; in effect, it creates a partnership between the target audience and PSYOP units. This adds a degree of authenticity to the operation and contributes to the success of a campaign.

AIRBORNE

In order to be able to perform any PSYOP missions, designated teams are airborne qualified when supporting airborne commands. Their organic equipment can be transported in US Air Force aircraft.

STRATEGIC OPERATIONS

Because strategic operations have long-range military and political objectives and frequently require coordination with other government policymaking agencies and friendly governments, PSYOP units supporting strategic operations generally will receive their instructions from the National Command Authority. Such PSYOP units generally do not operate in the combat zone.

TACTICAL OPERATIONS

Units supporting tactical operations of combat units in combat zones use mobile loudspeakers and audiovisual and printing equipment to achieve immediate and short-term objectives.

CONSOLIDATION OPERATIONS

PSYOP units supporting consolidation operations assist civil affairs commands in orienting and reeducating populations. The primary purposes are to make combat operations easier and quicker by gaining the willing cooperation of the populace.

LIMITS ON PSYOP

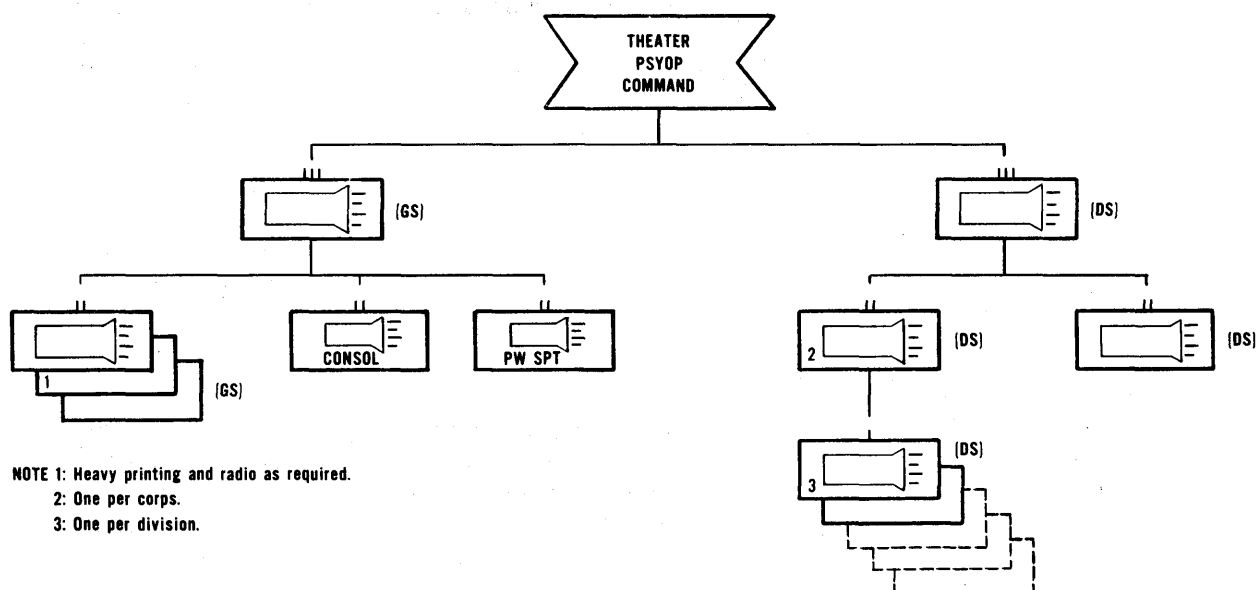

The limits imposed on psychological operations depend on several factors, such as the rules of land warfare, US Government policy, treaties and agreements to which the US is a signatory power, types and phases of conflict, the mission, and the availability of the target audience(s). For example, PSYOP elements on a training and advisory assignment in a friendly country, may do no more than train and advise. In addition, they must base their training and advice on US Army doctrine, techniques, and procedures.

ORGANIZATION OF PSYOP UNITS

(See TOE 33-500H, Psychological Operations Organization, for general organization, detailed breakdown of teams, capabilities, basis for allocation, personnel and equipment allowances.)

PSYCHOLOGICAL OPERATIONS COMMAND

When a PSYOP group is assigned to a theater, it is normally task organized to furnish PSYOP support to the theater of operations. Usually, general support battalions are retained to provide PSYOP support to the theater (see figure 4-1).

TYPE PSYOP UNIT ALLOCATION						
UNIT		THEATER	UNIFIED COMMAND	CORPS	SEPARATE DIVISION	TASK FORCE/ SEP BDE
GROUP		1 or more	1			
BATTALION	GS	1 or more	1			
	DS			1		
	PW SPT	1				
	CONSOLIDATION	1				
COMPANY					1	1

FIGURE 4-1

A TYPE THEATER PSYOP SUPPORT ORGANIZATION

GROUP HEADQUARTERS, TEAM AC

Group Headquarters, Team AC, is the highest level and largest PSYOP command and control unit. It consists of a staff and a supply and maintenance element. This group headquarters team commands and controls two to five PSYOP battalions. It also provides limited administrative and logistical support to its subordinate battalions. Team AC, with suitable operational teams, is normally assigned to theater Army or to a unified command when two or more PSYOP battalions are assigned or attached (figure 4-2).

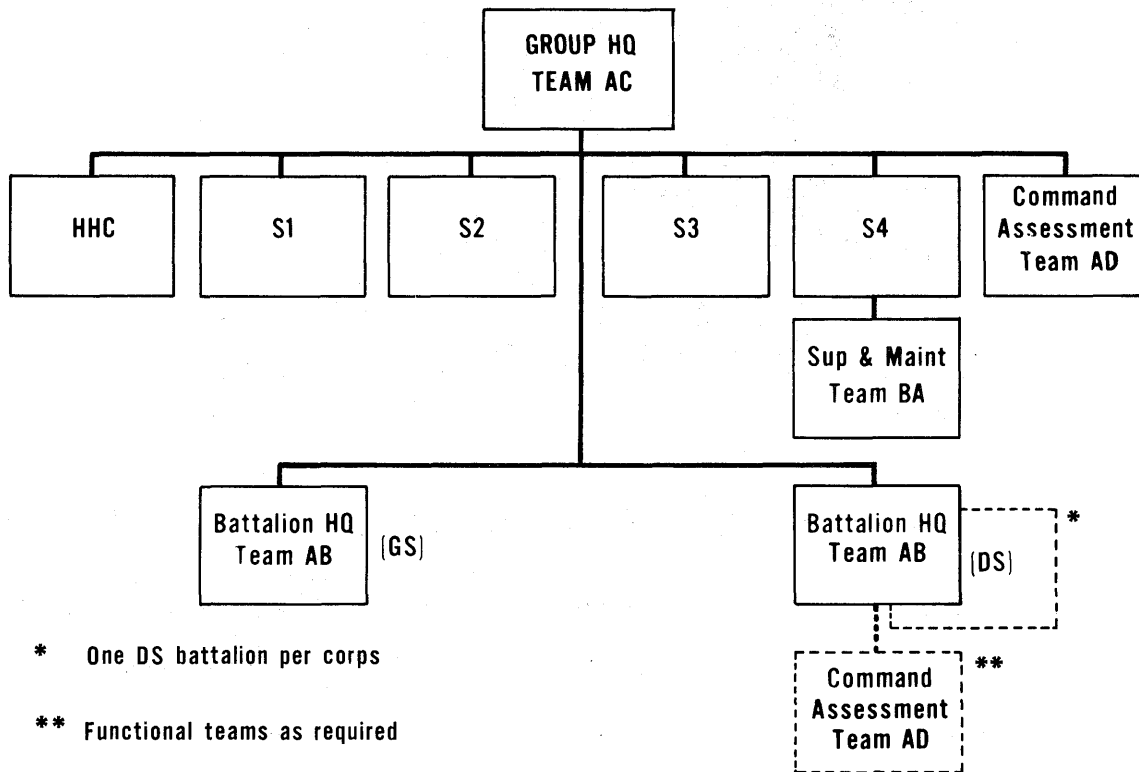

FIGURE 4-2

A TYPE ORGANIZATION PSYOP GROUP

COMMAND ASSESSMENT, TEAM AD

Command Assessment, Team AD, is deployed with a corps deployment package into a hostile area to analyze and evaluate the psychological warfare possibilities, to make recommendations to the ground force commander in the area of psychological operations, and to determine what PSYOP functional teams should be deployed into the area. It is also used to evaluate the results of any psychological campaign that had been conducted prior to insertion and to plan the use of themes to be used in a PSYOP campaign.

The basis of allocation is one per corps deployment package. This team is normally attached to a PSYOP DS battalion. It may, however, be made a part of a PSYOP group should circumstances so dictate (figure 4-2).

BATTALION HEADQUARTERS, TEAM AB (SUPPORT)

Battalion Headquarters, Team AB, with appropriate teams attached, may support all types of military operations. In performing its mission, the PSYOP battalion may be in GS or DS to:

- A major component of a unified command, or a subordinate unified command.
- A separate corps or unit of equivalent size.
- A separate division or equivalent size unit.
- A military police prisoner-of-war (PW) command.
- Others, as needed.

GENERAL SUPPORT (GS) BATTALION

A PSYOP battalion in support of the theater force as a whole consists of an AB team with attached research, intelligence, development, production, radio, and printing elements. A basis for allocation is one or more per theater, as required. A GS battalion normally does not have subordinate companies (figure 4-3).

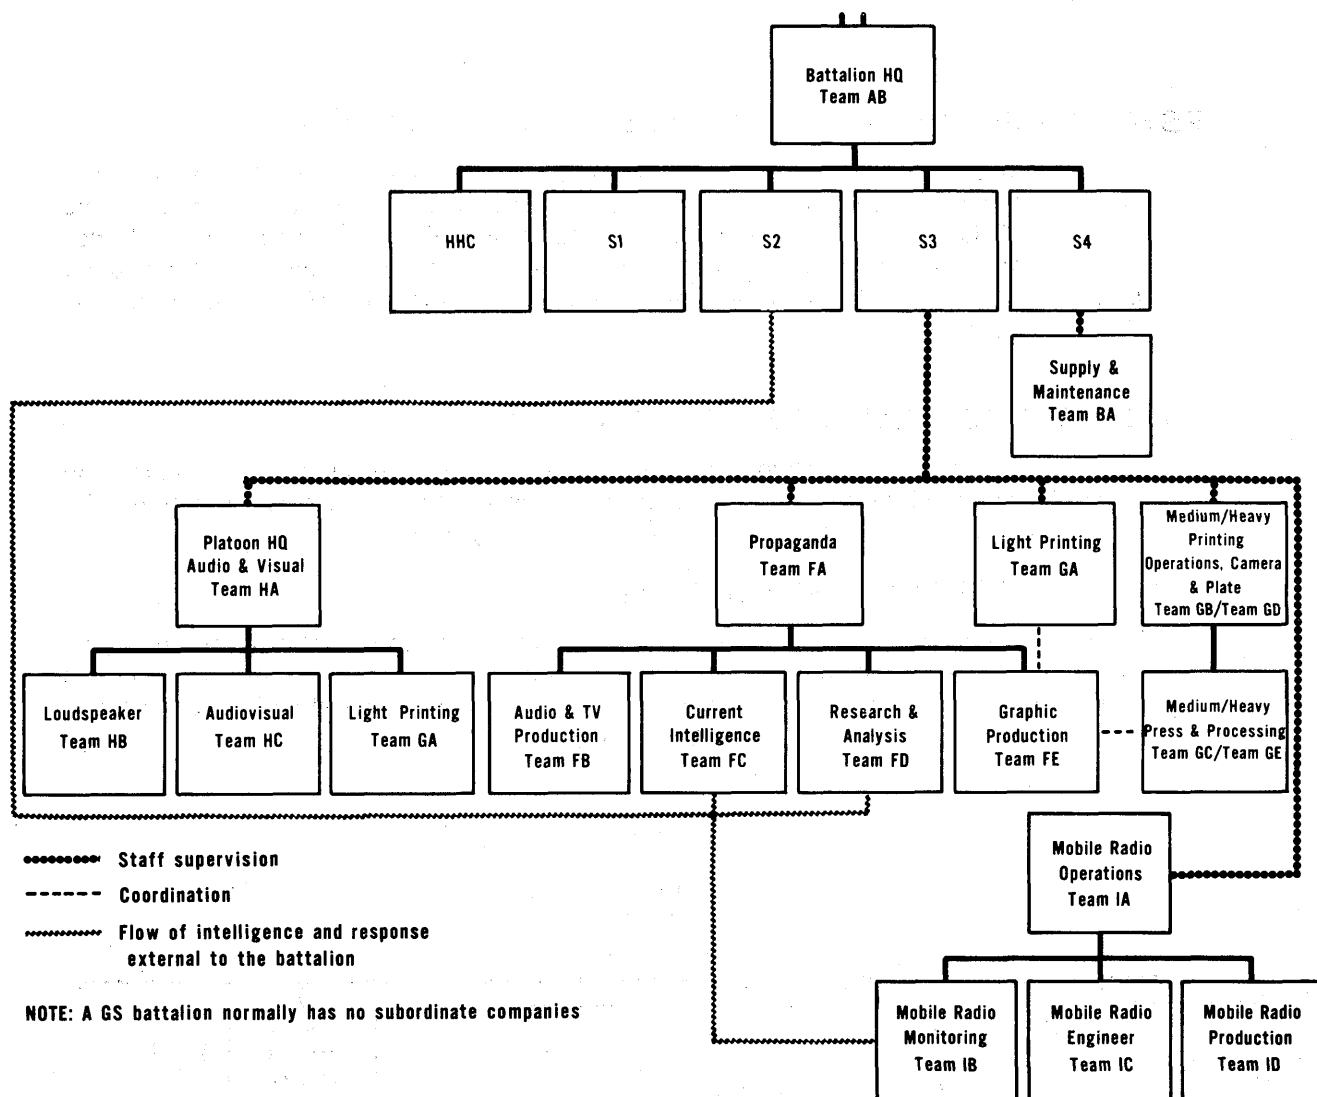

FIGURE 4-3

TYPE ORGANIZATION PSYOP GENERAL SUPPORT BATTALION

PSYOP DIRECT SUPPORT (DS) BATTALION HEADQUARTERS

A battalion headquarters in support of a tactical force consists of a staff, supply and maintenance, and a research and analysis element. This headquarters can command and control two to five PSYOP companies. It can provide logistical and PSYOP developmental support to subordinate companies. The basis of allocation is one per corps, separate division, or equivalent command.

When a PSYOP battalion is in direct support of a corps, the battalion HHC is retained at corps headquarters to provide general support to the corps. The other companies are placed in direct support of major subordinate headquarters. (See figure 4-4.)

PSYOP PRISONER-OF-WAR (PW) SUPPORT BATTALION

A PSYOP prisoner-of-war command support battalion works under the PW commander. It consists of an AB team with intelligence, research, propaganda development, and printing elements. This unit assists in planning and supervising PW education programs. It also acquires and disseminates intelligence and analyzes data received. The PW support battalion also pretests and post tests propaganda media. The basis of allocation is one per theater. (See figure 4-5.)

PSYOP CONSOLIDATION BATTALION

A PSYOP battalion supporting consolidation operations consists of an AB team and personnel qualified in motion picture, radio, television, printing, and display operations. The basis of allocation is one battalion per theater. (See figure 4-6.)

PSYOP DIRECT SUPPORT COMPANY

A PSYOP direct support company consists of an AA command and control team with supply and maintenance, propaganda, current intelligence, light printing, audiovisual, and loudspeaker teams. The basis of allocation is one per division, separate brigade, task force, or equivalent size command. (See figure 4-7.)

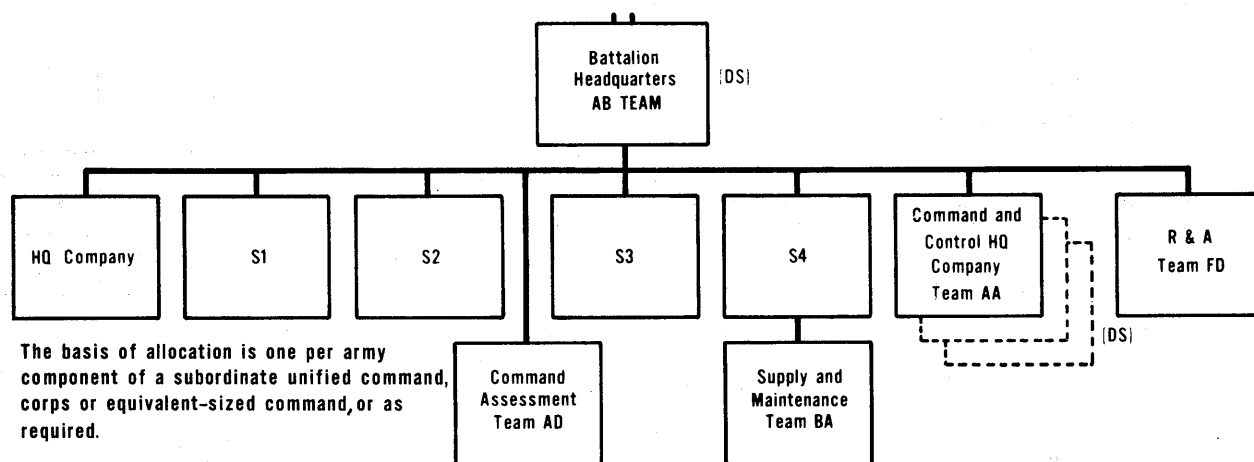

FIGURE 4-4

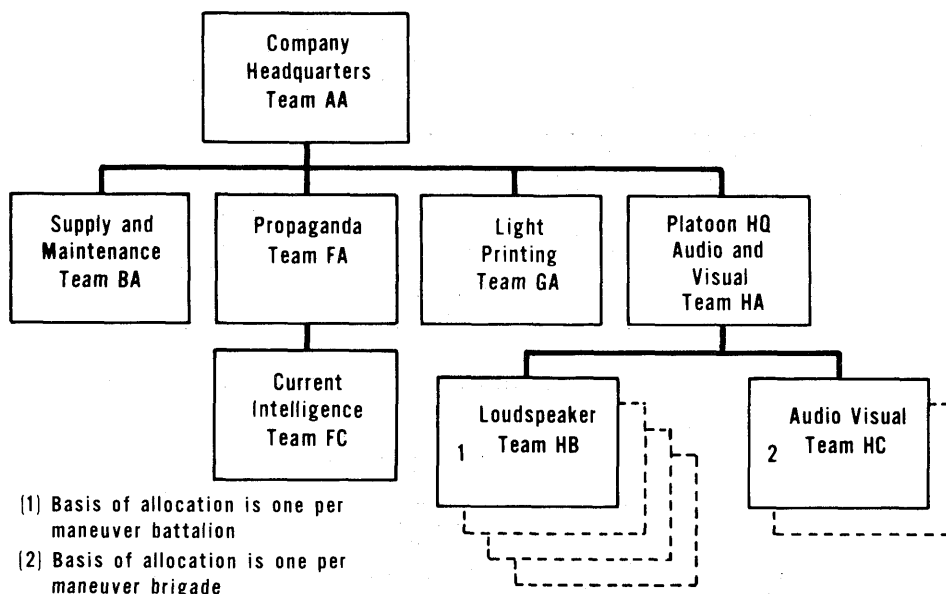

FIGURE 4-7

TYPE ORGANIZATION DIRECT SUPPORT COMPANY

PSYOP BATTALION OPERATIONS

MISSION

The mission of the PSYOP battalion is to:

Plan and conduct psychological operations.

Develop, produce, and disseminate propaganda.

Advise as to the psychological impact of planned and executed operations and actions.

In planning, executing, and coordinating the battalion effort, the psychological operations planner must:

Adhere to national policy **for the area of operations.**

Insure that psychological operations and propaganda produced conform to directives from higher headquarters, Department of State, or the ICA.

There is a serious danger that propaganda developed at the lower echelons will not conform to policy from higher headquarters. A commander cannot interject personal or "gut feeling" propaganda that violates policy. **It is the duty of the senior PSYOP officer with the command violating policy to advise against this course of action and to recommend a conforming course.**

Normally, the major tactical headquarters is granted approving authority to initiate PSYOP campaigns and introduce themes. They must, however, conform to the guidelines in the PSYOP section of the plan or order. **Propaganda may be disseminated only in the command area of responsibility.**

CAPABILITIES

The mission of the supported element determines the type, size, and mix of cellular teams that form the battalion. These factors determine the PSYOP unit's capabilities.

Battalion headquarters commands, controls, guides, and coordinates subordinate teams. Each battalion has an AB team. Each company has an AA team. The G5 office and the tactical operations center (TOC) are the points of contact for external coordination.

Intelligence Operations

Current intelligence is received from the G2/S2, the IB (Mobile Radio Monitoring) team, and other intelligence channels. Each battalion has one or more FC (Current Intelligence) and FD (Research and Analysis) teams working under close supervision of the FA (Propaganda) team. These teams process current and background intelligence for the battalion and provide the FA team with the information it needs.

Propaganda Development—Propaganda Development Center (PDC)

The FA, FB (Audio and TV Production), FC, FD, and FE (Graphic Production) teams are generally combined to form a PDC (located near the G5) whose members have routine access to information about current and planned operations.

$$\left. \begin{array}{l} \text{FA} + \text{FB} + \\ \text{FC} + \\ \text{FD} + \text{FE} \end{array} \right\} = \text{PDC}$$

With the information it receives from the FC and FD teams, the FA team develops campaigns, propaganda themes, and messages and determines the media to be used and the amount of propaganda to be disseminated in a given area (density of dissemination).

PDC Guidance and Information. In addition, the PDC guides and informs forward teams by:

Informal staff coordination.

Command visits.

Published orders and plans.

Target Analysis Worksheet. One of the major tools used by the PDC is a Target Analysis Worksheet which is a working summary of all intelligence collected relative to a target audience (see appendix F). The completed worksheet indicates:

The target.

Conditions affecting the target that are important to the psychological operator.

Audience weaknesses (susceptibilities) that can be exploited.

The extent to which the target group can help to accomplish the PSYOP mission.

Campaign Control Sheet. The FA team uses the Target Analysis Worksheet to develop a Campaign Control Sheet (appendix G). This document, in chart form, indicates the concept and execution of a PSYOP campaign. It is used to control a PSYOP campaign.

Production

FA team produces rough copy for all forms of propaganda.

FB team prepares radio, loudspeaker, and television scripts.

G-series teams print copy in final form; e.g., leaflets, posters, handbills, newspapers, magazines, etc.

ID team prepares and produces radio programs.

Spreading the Word

The distribution and dissemination of all propaganda is coordinated with the PSYOP battalion S3. The battalion may make personnel available to assist in aerial delivery of printed propaganda and loudspeaker messages.

HB team makes loudspeaker broadcasts.

HC team makes audiovisual presentations.

IC team transmits radio programs.

GA, GC, and GE teams print, package, and distribute printed propaganda to dissemination points.

PSYOP TEAMS IN THE FORCE REAR AREA

The printing, radio, and television teams are normally located in the rear areas of the major forces they support. The printing teams should be located where paper stocks can be properly stored and readily moved, and the final product can be easily distributed.

The graphics, printing, and audiovisual teams support a command on a mission basis. Work priorities are established by the PSYOP battalion S3 based on the needs of the supported force commander. Based on PDC guidance, scripts, graphics, and printed copy are prepared by local illustrators and writers or others intimately familiar with the target audience.

The Printing Cycle

The PSYOP battalion S3 gives the chief of the press section printing priorities and suspense dates. The organic teams--light GA, medium (mobile) GB and GC, and heavy (fixed) GD and GE--produce camera-ready copy and printed propaganda.

The final product must be approved by the originator of the propaganda request before it can be disseminated to the target audience.

The press team packages the final approved product for the selected method of dissemination and delivers it to the airfield, artillery unit, ammunition supply point, or other distribution point.

Air Support

Requests for aircraft to drop leaflets or make aerial broadcasts are normally made through the G3/S3 Air. The type of aircraft used, whether manned or remotely piloted vehicles (RPV), is determined by the Air Force or Army aviation element delivering the propaganda.

The density and effectiveness of enemy air defenses are major factors in determining whether air support will be available. There may be times when a valid request for air support cannot be met due to the extreme effectiveness of enemy defense measures. Use of aircraft exclusively for PSYOP missions is rarely possible.

Radio and Television

Radio and television programs are broadcast over available local and organic facilities. Qualified local personnel are used as much as possible, particularly scriptwriters, directors, actors, engineers, and stagehands.

FORWARD TACTICAL HB AND HC TEAMS

The HB (Loudspeaker) and HC (Audiovisual) teams normally **support forward tactical combat units**. These teams, which also collect intelligence, need qualified linguists. HB teams broadcast from the ground (mounted and dismounted) and from the air. HC teams present slide and motion picture shows, make loudspeaker broadcasts, and produce small amounts of leaflets.

LANGUAGE-QUALIFIED PERSONNEL

In order to be effective, the battalion must be augmented with a local, professional, language-qualified staff to assure that the final product is:

The best that can be produced.

Appropriate to the target audience.

Relevant to their interests.

Credible and persuasive.

*Chapter Five***PSYOP IN SUPPORT OF
FOREIGN INTERNAL DEFENSE**

The primary responsibility for preventing or defeating an insurgency rests with the host country (HC) government--not with the United States or any other assisting government. As a first step, the host government must recognize the existence of an insurgency and fully understand its political nature. Once the HC government understands the cause of the insurgency, it must show interest in the well-being of the people by developing and implementing programs that meet their needs.

ROLE OF THE PSYCHOLOGICAL OPERATOR

The psychological operator has a major role in PSYOP support of FID. He must:

IDENTIFY DESIRABLE PROGRAMS

First, he must identify the objectives of the HC programs, the HC institutions that have a PSYOP impact, and the programs that HC PSYOP can accomplish.

PARTICIPATE IN POLICYMAKING

Then, he must participate in policymaking at all levels of command. In fulfilling this role, he must assure that the greatest possible consideration is given to the psychological aspects of all policies, programs, and operations.

COMMUNICATE

His next role is that of communicating. In HC PSYOP one of his major roles may be to assist in making known and "selling" the positive programs of the government to its major internal targets. Unexplained government programs breed rumors and suspicion. The communicated program promotes public awareness and appreciation of the government's interest in its people.

THE HOST COUNTRY SOLDIER

Host country armed forces personnel must be indoctrinated with the importance of the civilian population in internal defense and development operations. The individual soldier must understand that his actions toward the population may spell the difference between success or failure.

HOST COUNTRY PSYOP SUPPORT

A unified communications organization is needed for FID activities. An established bureaucracy may tend to become isolated and unable to communicate with the public it is supposed to serve. PSYOP must be closely coordinated with the government information services to avoid contradiction in output.

The criteria for selecting PSYOP personnel should be ability and skills rather than military versus civilian status; neither category has a monopoly on imaginative skill or the ability to influence people. The admixture of personnel takes into account the fact that the political and military aspects of insurgency are interwoven. In order to have any chance of success, the guidance and operations of the integrated PSYOP organization must be accepted by all military and civilian sectors of the population.

US SECURITY ASSISTANCE TO HC PSYOP

US Army participation in PSYOP is initiated **on request of the host government and upon approval of the appropriate US Government agencies**. US Army PSYOP elements may be developed and deployed as mobile training teams (MTT), technical assistance teams (TAT) as part of a US security assistance element, or in direct support of US combat units. They may be attached or under operational control (OPCON) to an in-country Joint US Security Assistance Training Group (JUSSATG).

In order to cope with misunderstandings, delayed actions, or inaction brought about by differences in stages of development and sophistication, culture and language, concepts of time, orientation to mission accomplishment, etc., the US psychological operator must have patience. Differences in patterns of behavior, ethics, pace of life, concepts, sense of obligations, loyalties, concern with adherence to rigid time frames and schedules, and so on may lead the US psychological operator to become impatient and try to do the job himself. This effort is generally doomed to failure. When he has failed to do the job himself, the US psychological operator may try to have host country personnel do it all; this, too, will fail.

The US psychological operator cannot insist that HC personnel attempt to communicate with US equipment and techniques as he does (i.e., as American substitutes). The communications that will result will be neither US nor HC but will combine the worst characteristics of both, with equally disastrous results.

US PSYOP forces can best assist the host country with hardware and advice. This subsidiary role of US forces does not lessen the responsibility of the host government to communicate with its own people, using its own tools and techniques, in its own image.

THE HOST COUNTRY SOLDIER

Host country armed forces personnel must be indoctrinated with the importance of the civilian population in internal defense and development operations. The individual soldier must understand that his actions toward the population may spell the difference between success or failure.

HOST COUNTRY PSYOP SUPPORT

A unified communications organization is needed for FID activities. An established bureaucracy may tend to become isolated and unable to communicate with the public it is supposed to serve. PSYOP must be closely coordinated with the government information services to avoid contradiction in output.

The criteria for selecting PSYOP personnel should be ability and skills rather than military versus civilian status; neither category has a monopoly on imaginative skill or the ability to influence people. The admixture of personnel takes into account the fact that the political and military aspects of insurgency are interwoven. In order to have any chance of success, the guidance and operations of the integrated PSYOP organization must be accepted by all military and civilian sectors of the population.

US SECURITY ASSISTANCE TO HC PSYOP

US Army participation in PSYOP is initiated **on request of the host government and upon approval of the appropriate US Government agencies**. US Army PSYOP elements may be developed and deployed as mobile training teams (MTT), technical assistance teams (TAT) as part of a US security assistance element, or in direct support of US combat units. They may be attached or under operational control (OPCON) to an in-country Joint US Security Assistance Training Group (JUSSATG).

In order to cope with misunderstandings, delayed actions, or inaction brought about by differences in stages of development and sophistication, culture and language, concepts of time, orientation to mission accomplishment, etc., the US psychological operator must have patience. Differences in patterns of behavior, ethics, pace of life, concepts, sense of obligations, loyalties, concern with adherence to rigid time frames and schedules, and so on may lead the US psychological operator to become impatient and try to do the job himself. This effort is generally doomed to failure. When he has failed to do the job himself, the US psychological operator may try to have host country personnel do it all; this, too, will fail.

The US psychological operator cannot insist that HC personnel attempt to communicate with US equipment and techniques as he does (i.e., as American substitutes). The communications that will result will be neither US nor HC but will combine the worst characteristics of both, with equally disastrous results.

US PSYOP forces can best assist the host country with hardware and advice. This subsidiary role of US forces does not lessen the responsibility of the host government to communicate with its own people, using its own tools and techniques, in its own image.

Within the context of an insurgency, US PSYOP have five major objectives:

Assist the HC government in gaining the support of its people.

Assist the HC government in defeating the insurgent movement.

Assist the HC government in providing a psychological basis for rehabilitating returnees from the insurgent movement.

Establish and maintain a favorable US image in the HC.

Influence neutral groups and the world community.

Target Audience Considerations

Although the physical situation is important, the social environment of the target is generally more significant. One major consideration is the diversity of target audiences. Each target audience is composed of individuals and groups living under diverse constraints, having diverse interests, levels of education and intelligence, occupations, beliefs, attitudes, and perceptions.

Campaigns, themes, and messages must be designed to influence the various groups within each major audience category; propaganda produced must be based on the culture of each major target group and appeal to the personal sensitivities and interests of that target group.

In an FID situation, the government must convince the populace of its concern. Government activities must reflect government programs that are effective, attractive, and beneficial to the population.

HOST COUNTRY TARGET GROUPS

THE INSURGENT

The major PSYOP objectives are to discredit the insurgents and to isolate them from the population. The insurgents include the guerrillas and their supporting elements--the auxiliary and the underground. The insurgent's infrastructure is invisible. This gives the insurgent an advantage over the government as any damage done to the government is highly visible and has an immediate effect.

An insurgency is determined and gains morale and physical strength in direct proportion to its effectiveness and the attractiveness of its ideology. The cadre and highly motivated members may not be vulnerable to propaganda. Below them, however, there are usually a number of vulnerable individuals and groups; these, though tightly controlled, can be propagandized effectively. The most important direction of attack is against insurgent unit morale.

The insurgent must be destroyed physically and psychologically. Psychological destruction is extremely important because without it, the insurgent force may simply disappear underground to surface at a more opportune time.

Programs should publicize and exploit differences between cadre, recruits, supporters, and the local population. Other themes might emphasize lack of support, isolation, homesickness, or hardship suffered by the guerrillas.

THE POPULATION

Since popular support of the people is essential to victory, the population is the major psychological target of the insurgent and the government. The people are the source of intelligence, manpower, and logistical support for the insurgents.

The major PSYOP mission is to build national morale, unity, and confidence in the government, its leaders, and programs. There should also be an effort to win popular acceptance of the presence of US Armed Forces and to convince the people that:

Government programs serve the interests of the people.

The government forces will protect the people and defeat the insurgent.

Ultimate victory is assured. This need to stress ultimate victory is paramount because if the insurgency enters the second stage, the people's immediate concern will be survival, and they will support the apparent victor.

Voluntary reporting of antigovernment activities is in their best interests.

The insurgent is being misled by questionable promises of a foreign power and is the lackey of that foreign power.

Identification of insurgent leadership will shorten the life of the insurgency and hasten return to a way of life that fulfills the perceived needs of the people.

The people have a major active role in essential counterintelligence activities.

GOVERNMENT PERSONNEL

Host country government personnel are a major internal target. The military, paramilitary, civil services, and other elements of the government make excellent target audiences because:

They have a vested interest in having the government remain in control.

The established chain-of-command or organizational structure facilitates communications and local response.

The PSYOP mission in dealing with this target group is to maintain loyalties and develop policies and attitudes which will result in members of the group:

Realizing the importance of the population and the necessity for popular support.

Promoting the public welfare and justice.

Taking actions within their sphere of activity that will eliminate the basic causes of the insurgency.

Protecting the population from the insurgent.

NEUTRAL AND NONHOSTILE ELEMENTS OF THE POPULATION

The emphasis in communication to the friendly or uncommitted population should be positive and constructive. PSYOP efforts should publicize the tangible and visible accomplishments of the legitimate government. Part of the communication effort should discourage public apathy and activity that will help the insurgent.

The population should not be asked to undertake any action that is contrary to its own direct interest. The most obvious example is action which leads to physical jeopardy or death. If the population takes such action, not realizing the consequences, and the outcome is harmful, the authority that sponsored the communication will lose credibility and its audience.

POPULATION COMMITTED TO SUPPORT THE INSURGENT

The audience supporting the insurgent may do so either out of conviction or involuntary involvement. The PSYOP mission in this case is to achieve a withdrawal of support for the hostile effort and defection in place or in person to the host government. A surrender or return program is recommended as the core effort toward this target.

FOREIGN AUDIENCES

Foreign audiences range widely, geographically, politically, and in their relationships with and attitudes toward the legitimate government and the insurgents. For neutral nations, the purpose of PSYOP is to achieve a friendly neutrality or active support. For external hostile powers, the major objective of PSYOP is to influence public opinion within such nations. An active minority within such nations can change the course of national policy and action. Plausible communications are needed to influence foreign audiences.

Communications to foreign audiences can have a favorable effect on domestic audiences, particularly urban intellectuals and mass media communicators who may be influenced by the foreign reaction.

INSURGENT PROPAGANDA OBJECTIVES AND ORGANIZATION

The insurgent has recognizable psychological objectives, methods, and organization. His themes appear rational and, therefore, are difficult to neutralize or discredit.

THEMES

Insurgent themes typically stress government weaknesses and the gap between government programs and policies and the perceived needs of the people. The primary theme stresses the idea that the objectives of the insurgent coincide with the needs and aspirations of the people. They try to convince the people that the interests of the populace are not served by the government. Themes about government corruption, nepotism, scandal, and other corruptive factors are used to convince the people that their government is unfit to lead them. Other themes used are anticolonialism, nationalism, and land reform.

Insurgent leaders try to make everyone a propagandist. However, the driving force is the hard core cadre.

THE INSURGENT ORGANIZATION

A major technique of expanding control is by means of a vertical shadow political organization--a shadow government. The primary function of the vertical organization is to insure centralized and responsive direction of the insurgent component, either covertly or openly, as circumstances permit. In an insurgent-controlled area, the organization is headed by the local party secretary. The other local personnel report to him.

At the same time, horizontal organizations act as propaganda agencies. These agencies stress the use of face-to-face PSYOP. All other types and media of propaganda are also aggressively used--propaganda of the deed, radio, TV, leaflets, and rumor.

The horizontal organizations organize the populace into functional and "window dressing" groups that meet the needs of the insurgent leaders to control the population through organized groups and that meet the needs of the people to participate. These groups, because they appear and allege to be independent and acting on their own, are extremely deceptive. Individuals within these groups (farmers, women, students, young people, etc.) are closely supervised and criticized. Through such organizations, the insurgents cultivate, indoctrinate, recruit, and manipulate a variety of social groups under their control and through them bring in new adherents. Gradually, these organizations take over all social, political, economic, cultural, public safety, and military institutions.

PSYOP TRAINING, ADVISORY, AND ASSISTANCE EFFORTS

The major security assistance role of US military personnel may be to train, advise, and assist a requesting government threatened with insurgency. In this capacity PSYOP personnel/units would have the missions to:

- Improve the ability of the HC to conduct PSYOP in support of its own internal defense and development program.

- Improve HC command and staff understanding of the PSYOP role in internal defense and development and implementation of PSYOP in HC internal defense and development operations and related programs.

- Recommend and provide, when not otherwise obtainable, essential materiel which can be used and maintained by the host country.

These missions may require US PSYOP personnel to train, advise, and assist:

- Host country armed forces.

- Host country paramilitary and public safety forces.

- Other elements and agencies of the HC government.

- The US military mission within the host country.

An organization should be structured to perform these unique multiple missions. As a minimum, it should contain these elements:

A headquarters element (company, battalion, group). In a small country, a command and control team should be sufficient.

Training elements, such as detachments, teams, or individuals.

Local augmentation, such as:

Professionals and technicians.

Interpreters and translators.

Secretarial and clerical personnel.

Service personnel.

US military personnel providing security assistance do not conduct psychological operations in a host country. The Joint US Security Assistance Training Group (JUSSATG)--the senior US military headquarters--and subordinate advisory units and activities should give active advisory attention to PSYOP and alert HC counterparts to the psychological impact of all military actions, operations, and individual acts of the HC armed forces.

In order to centralize control, the commander of the US PSYOP unit within the HC may be designated as the US command PSYOP staff officer, or he may provide a representative who can support the G5/J7 staff (CMO) mission in accordance with FM 101-5. The duties of this officer should include those of preparing annual PSYOP training, advisory, and assistance plans.

Budgetary restraints will limit the extent of PSYOP training, number of persons receiving training, and training areas. Monetary restrictions will also set limits on fulfillment of PSYOP equipment needs and procurement sources; i.e., in-country, CONUS, offshore.

Chapter Six

PSYOP IN SUPPORT OF UNCONVENTIONAL WARFARE

Unconventional warfare (UW) involves a broad spectrum of military and paramilitary operations conducted in enemy-held, enemy-denied, or politically sensitive territory. It includes, but is not limited to, the interrelated fields of guerrilla warfare, evasion and escape, subversion, special operations, and other low-visibility covert or clandestine operations. These interrelated aspects of unconventional warfare may be prosecuted singly or collectively by predominantly indigenous personnel.

US unconventional warfare forces, augmented by psychological operations personnel, may support and direct the indigenous personnel effort during all conditions of war or peace.

ROLE OF PSYOP

US UW forces operating within the UW environment have a thorough knowledge of the national and regional social, economic, political, and cultural characteristics of the populace. They have a working ability in the language, communication patterns, and psychological sensitivities of the local populace. The US Army PSYOP element deployed by the US command assists US UW forces in meeting PSYOP requirements.

During UW operations, psychological operations are used to strengthen a weak cause and to make a strong cause even stronger so that its followers, by word and deed, become its dedicated propagandists. More specifically, PSYOP can create unity, maintain or boost morale, renew the resistance force's determination, and develop sympathy for the resistance among uncommitted segments of the population.

PASSIVE ROLE

The mere presence of US UW forces--their operations, official activities, and individual conduct--has a psychological impact on indigenous military and paramilitary forces and the civil population. Official activities and individual conduct in particular help to offset possible unfavorable attitudes of neutrals and uncommitted segments of the population.

US Army PSYOP personnel advise and assist UW forces in developing a favorable image, an image that will win the support of the neutrals, the uncommitted segments, and the resistance movement, its underground and auxiliary forces.

ACTIVE ROLE

With the backing of the United States and its allies, PSYOP policy guidance is directed by the US Ambassador, by the theater military commander, or by a higher level official. These policies, in conjunction with those of local leaders or a government-in-exile, are issued in the form of joint directives. These directives give the authenticity and momentum required to implement an active PSYOP campaign. Within these directives, US PSYOP personnel can actively support UW forces by:

Publicizing successful ambushes and raids, sniper campaigns, interdiction operations, and civil assistance such as sharing medical services and supplies and giving sanctuary to civilian supporters of the resistance.

Publicizing that UW forces are providing manpower and skills to assist the populace in repairing or building needed structures, harvesting crops, maintaining schools and places of worship, and organizing social activity groups. Only structures and activities that the civil population can and will maintain should be assisted. In addition, it is preferred that the idea for a project or other activity and the major input of labor therefore come from the local people.

Warning the civilian population of impending aircraft or missile attacks. These warnings give the impression that the guerrillas control the operation and strengthen the belief of the population in the might of the guerrilla force.

Encouraging some or all of the civilian population, as appropriate, to resist laws, regulations, and restrictions imposed by enemy authorities.

Organizing support elements in all target groups by conducting and supporting intensive education and indoctrination programs.

Meeting face-to-face with local civilians when a specific objective cannot otherwise be fulfilled. These meetings give tangible evidence of US support and appreciation of the objectives and problems of the local guerrilla force. The impact can be strengthened during all stages of UW organization and development.

Assisting in the development and perpetuation of front groups within the populace.

It is crucial that supporting PSYOP personnel have a thorough knowledge of the UW commander's operations environment. Successful employment of psychological operations will win the assistance of supporting resistance elements and build a viable organization.

PSYOP SUPPORT IN UW

PSYOP personnel will plan the type of campaign, themes, messages, media, and methods employed based on an analysis of the target audience. These plans must be integrated in the seven phases of guerrilla warfare--from the psychological preparation stage through the linkup with conventional forces to demobilization. (See PSYOP in the Seven Phases of Development of US-Sponsored Resistance Forces, page 6-6).

PSYOP ASSETS

Theater Command. US Army PSYOP facilities, external to the UWOA, are set up in the theater communications zone by US Army PSYOP units.

Theater UW Command. To support the seven phases of guerrilla warfare, the theater commander attaches a portion of the theater PSYOP resources to the theater UW command. The UW command headquarters coordinates with and supervises US PSYOP support within the UWOA, and coordinates this support with the unified command. Requests for additional PSYOP support are submitted to the unified commander.

Joint Unconventional Warfare Task Force (JUWTF). During hostilities, a psychological operations staff officer from theater headquarters should coordinate with the JUWTF to assist US UW detachments in their respective areas of operations.

Special Forces Operational Base (SFOB). Detachments receive appropriate PSYOP guidance prior to infiltration and are prepared to advise the SFOB commander on psychological opportunities as they arise, to train selected resistance members to apply PSYOP, and, if required, to initiate PSYOP campaigns in coordination with the JUWTF. If additional PSYOP support is required to accomplish tasks beyond the capabilities of the supporting PSYOP element, the SFOB must initiate the request.

Initial PSYOP facilities within the unconventional warfare operations area (UWOA) are austere. Reliance is based primarily on face-to-face communication, but printed media can be produced in enemy-controlled areas by auxiliaries and the underground if indigenous facilities exist. Radio and television coverage may be achieved in the UWOA by transmissions originating from adjacent secure areas.

In later phases, additional PSYOP facilities may be placed in secure areas within the UWOA.

PSYOP TECHNIQUES IN SUPPORT OF UW

Psychological operations techniques such as intelligence collection, target analysis, media selection, propaganda development, and feedback are generally applicable in a conventional or unconventional warfare environment. The task of the psychological operations personnel supporting the UWOA is to employ imaginatively and decisively these techniques in an unconventional warfare environment. To assist in this transition, the PSYOP personnel must be aware of those UW perspectives which differ significantly from conventional PSYOP techniques of employment (See chapter 3, (C) FM 31-20.)

INTELLIGENCE FOR PSYOP

Intelligence is the lifeblood of successful PSYOP. Without intelligence about the feelings and persuasions of the UW target audience, a PSYOP campaign is not likely to succeed. (See chapter 14.) UW forces, by virtue of their mission, deployment, training, and contacts, are able to gather intelligence relevant to the attitudes, allegiance, activities, vulnerabilities, and susceptibilities of the local population, guerrillas, underground, and auxiliary.

MAJOR TARGET AUDIENCES

Using the information supplied by UW forces and other intelligence agencies, four major target audiences may be identified (see pp. 196-198, section V, chapter 3, (C) FM 31-20, and pp. 5-6 to 5-7, chapter 5, this manual):

The Uncommitted

In the initial stage of hostilities, the general population may be neutral or may actively oppose the resistance effort because of fear or uncertainty about the aims of the movement and its success. PSYOP support, therefore, must stress that the resistance shares the political and social goals of the population; that the United States and its allies, in supporting the guerrilla (the military arm of the resistance), support these same goals; and that the resistance movement will be successful.

Enemy Sympathizers

Enemy sympathizers include those civilians in an operational area who are:

- Willing enemy collaborators.

- Unwilling enemy collaborators--those who collaborate under duress.

- Passive enemy sympathizers.

A PSYOP campaign aimed at this target instills doubt and fear. It may be conducted in conjunction with positive political action programs--programs which identify and discredit the enemy collaborator or weaken his belief in the strength and power of the enemy military forces.

It must be noted that punitive action against such collaborators may result in enemy reprisals and, consequently, in a loss of broad civilian support for PSYOP objectives. However, overreaction by the enemy can, when skillfully exploited, build popular support for the guerrilla cause.

Enemy Military Forces

Enemy military forces may be of the same nationality as the population, or they may represent an occupying power or one assisting the enemy government.

PSYOP campaigns are directed against these groups to make their members:

- Feel isolated.

- Improperly supported.

- Doubtful of the outcome of the struggle.

- Distrustful of each other.

- Doubtful of the morality of their cause.

By focusing on the enemy soldier's frustrations, PSYOP can lower his morale, reduce his effectiveness, and create feelings of inadequacy, insecurity, and fear, increasing his susceptibility to PSYOP and making him more vulnerable to persuasion to surrender, malingering, show disaffection, or desert.

Resistance Sympathizers

Resistance sympathizers include those civilians who are sympathetic to the goals of the movement but who are not active members of some element of the resistance force.

Psychological operations campaigns directed at this target audience stress appeals for the populace to actively (though generally covertly) support or passively cooperate with the resistance forces in achieving common objectives. Inherent in these appeals is a rigid personal code of conduct by resistance members which insures that the people, their sensitivities, culture, customs, and needs are strictly respected.

The words and deeds of the resistance must assure the people that the movement can always be counted on to help protect them from all enemies, and that it is the instrument of political, social, and economic progress--as visualized by the populace.

PSYOP IN THE SEVEN PHASES OF DEVELOPMENT OF US-SPONSORED RESISTANCE FORCES

PHASES	CHARACTERISTICS	PSYOP ACTIVITIES
I-Psychological Preparation	Inhabitants of the area are prepared psychologically to receive US forces.	A PSYOP campaign is planned and executed to prepare the inhabitants of the proposed operational area(s) for the presence of US UW forces. The campaign is planned at the highest levels of a government preparing to support a resistance movement. Citizens-in-exile; other popular, respected, and influential people; and key in-country sympathizers are used. US PSYOP units, under the guidance and supervision of the force/theater commander, have a major role in the campaign.
II-Initial	US nonmilitary agencies in coordination with the allied government-in-exile have verified that the populace is willing to accept sponsorship for their resistance efforts. Initial contact has been made with the resistance force (RF) whose leader requested assistance and sponsorship. The Special Forces Operational Base (SFOB) has been established and is fully operational. Operational elements are in isolation receiving extensive briefings and conducting studies.	<p>The emphasis of the PSYOP campaign is changed to support planned RF operations. The SF Group S5, with supporting PSYOP elements, is responsible for preparing the PSYOP plan. The S5 must:</p> <ul style="list-style-type: none"> With SFOB commanders and indigenous assets which have exfiltrated to accompany US UW elements, develop PSYOP campaigns for areas of operations. Conduct PSYOP orientation and training on target groups, communications characteristics and dynamics, themes, symbols, messages, propaganda production, use of media, and dissemination. Provide US personnel with an understanding and appreciation of the mutual relationship and interdependence of US and resistance forces. Develop themes, symbols, and PSYOP actions to support each phase of operations from infiltration to demobilization. Brief all operational elements on propaganda to be disseminated and PSYOP actions to be conducted in each area of operations. Coordinate with area specialist teams (ASTs) on PSYOP plans for each operational area.

PHASES	CHARACTERISTICS	PSYOP ACTIVITIES
III-Infiltration	Operational elements have been briefed on PSYOP. Infiltration is complete and contact has been established with resistance leaders.	<p>PSYOP is conducted in support of US UW forces/resistance force contact and development. The area assessment and a PSYOP program through face-to-face communications are initiated.</p> <p>Operational elements establish rapport, having been advised and briefed by the S5 and supporting PSYOP personnel prior to infiltration.</p> <p>Propaganda is supported by tangible evidence of sponsor support in the form of weapons, ammunition, medical supplies, and money provided to resistance leaders.</p> <p>PSYOP themes stress:</p> <ul style="list-style-type: none"> The ultimate success of the resistance movement. The need for mutual support, confidence, and working rapport.
IV-Organization	The operational element has succeeded in establishing rapport with resistance leaders. Tangible proof (money, weapons, medical supplies, etc.) and supporting propaganda have convinced the resistance force that with mutual support, confidence, and working rapport, fundamental goals and objectives can be achieved. Area and guerrilla organization is developed and training begins. Small-scale combat operations may be conducted. The requirement exists for the operational elements to implement unity programs.	<p>The PSYOP effort is expanded to assist in increasing and developing the resistance force.</p> <p>A major objective of the PSYOP program is to insure close cooperation between all resistance elements. Resistance leaders participate in the formulation of PSYOP objectives and are persuaded NOT to take any action which contradicts or interferes with the accomplishment of these objectives.</p> <p>Motivational campaigns targeting the guerrilla forces are initiated. They cover:</p> <ul style="list-style-type: none"> History of the country. History of the enemy and his objectives. The significance of and need for proper personal conduct of the resistance force toward the civilian population. <p>PSYOP indoctrination programs will cover:</p> <ul style="list-style-type: none"> Political, economic, and social objectives of the resistance movement. Ideological indoctrination of the resistance cadre. The practical impact of tactical operations on the population.
V-Buildup	Small-scale combat operations increase local support and attract recruits for the resistance force. Operational elements increase their activities to establish rapport, to promote cooperation and unified action, to provide tangible proof of support, and to motivate the resistance force.	<p>PSYOP campaigns (propaganda and actions) are conducted to support the expansion and full development of the resistance force.</p> <p>PSYOP must:</p> <ul style="list-style-type: none"> Encourage young people to join the resistance elements. Encourage and win general civilian support for the resistance movement.

PHASES	CHARACTERISTICS	PSYOP ACTIVITIES
V (cont)- Buildup		<p>Themes, directed to the resistance force, emphasize the rules of engagement. The rules should call special attention to targets whose destruction would impact adversely on the civilian population.</p> <p>The PYSOP campaign continues to stress and assure the success of the resistance force and allied operations.</p> <p>PSYOP must impress resistance leaders that producing favorable reactions among the populace is vital. (This PSYOP program must strongly impress upon them the need to indoctrinate their followers with the need for proper individual and official conduct toward the population. It must also point out the need for stringent disciplinary action against offenders.)</p>
VI Combat Employment	<p>Successful small-scale combat operations have attracted many recruits. The resistance force is now fully developed and full combat operations planned. Due to enemy propaganda, disruption of daily life, and destruction of property, many members of the populace do not understand the reasons for the resistance force's operations. The enemy is actively engaged in reprisals and counter guerrilla operations.* This phase continues until linkup with conventional forces or until cessation of hostilities.</p>	<p>PSYOP must support and exploit the combat capability of the resistance forces.</p> <p>Current propaganda efforts continue. Themes and symbols are directed at various target audiences.</p> <p>Resistance Movement: Assurance of resistance force success over the enemy is stressed. Emphasis is placed on the inevitability of complete victory.</p> <p>Populace: The major themes are nationalism and the support of the resistance movement.</p> <p>Guerrilla Forces: Motivational and indoctrination campaigns are increased. Emphasis is placed on the ability of the guerrilla forces to defeat the enemy; the enemy's frustration in counter guerrilla operations is exploited.</p> <p>Enemy Forces: The inevitability of the enemy's death and defeat by the resistance force is emphasized. The fact that the enemy is not safe in any area is stressed.</p>
VII Linkup and Demobilization	<p>Conventional forces have moved into range of designated UWQAs and linkup operations are imminent. Liaison parties (which include PSYOP personnel) from the SFOB have been attached to the conventional force headquarters with plans for PSYOP to support the linkup and demobilization of the resistance force. SFOB prepares and coordinates plans with the conventional tactical ground commander. Because of its extreme sensitivity and importance, plans for demobilization must begin in the early phases of operations and be continuous.</p> <p>When the resistance force is no longer needed, higher headquarters will order its disposition, to include demobilization. The practical problems of nationalization, i.e., political, economic, social, ethnic, racial, religious, and military, are surfaced.</p>	<p>PSYOP propaganda and actions (campaigns) support the linkup and the subsequent demobilization.</p> <p>Linkup: Information is widely distributed in the UWQA to prepare the populace to cooperate fully with the conventional tactical forces. The public is urged to remain in place in order not to hinder operations that will bring hostilities to a successful end.</p> <p>Resistance leaders are briefed on the importance of close cooperation with tactical force commanders.</p> <p>The resistance force is psychologically prepared to be incorporated into the national army or to be demobilized.</p> <p>Resistance leaders and guerrilla force commanders are psychologically prepared to accept new leadership from the conventional force on linkup.</p> <p>Troop commanders and staff officers inform the troops of the importance of proper individual and unit conduct.</p> <p>Demobilization: A PSYOP campaign is implemented to explain the demobilization process.</p> <p>The campaign provides for the orderly transition of the resistance force to peaceful civilians, preventing the formation of quasi-military or political groups in conflict with the objectives and policies of the recognized government.</p> <p>Loyalty to the post-hostilities government is stressed.</p>

*NOTE: PSYOP are offensive; they are not defensively reactive to enemy reprisals or actions designed to discredit the resistance force.

Chapter Seven

PSYOP IN SUPPORT OF SPECIAL OPERATIONS

COVERT OPERATIONS

Covert PSYOP are normally not a function of US military PSYOP elements due to their political sensitivity, extensive required compartmentation, and normal execution as a component of higher level special operations and planning. Covert PSYOP require exceptional coordination, integration, and direction. They do not disclose their source. The operations are planned and conducted in such a manner that the responsible agency or government is not evident, and if uncovered, the sponsor can plausibly disclaim any involvement.

To achieve maximum impact and to preclude compromise of the overt PSYOP effort, covert and overt operations should be totally separate operations. Personnel engaged in one type of operation must not be engaged in or exposed to the other. Black and gray propaganda are employed in cover operations. (Black, gray, and white do not refer to anything inherent in the content of the propaganda itself, but indicate methods used to carry out an operation.)

CONTENTS

	PAGE
Covert Operations.....	7-1
Black Propaganda	7-2
Gray Propaganda.....	7-3
Covert Radio Operations	7-3
Tactical Deception	7-3

7

BLACK PROPAGANDA

Propaganda which purports to emanate from a source other than the true one is known as black propaganda.

Black propaganda is best used to support strategic plans.

Advantages

Black propaganda may originate within or near the enemy homeland, or enemy-held territory, and may provide immediate propaganda messages for a specific audience.

The presumption of emanating from within an enemy country lends credibility to black propaganda and helps to demoralize the enemy by suggesting that there are dissident and disloyal elements within his ranks.

Through the skillful use of terminology, format, and media, messages appear to be a part of the enemy's own propaganda effort, making the enemy appear to contradict himself, and forcing him to mount an expensive, difficult, and exploitable counterpropaganda campaign that highlights the original black propaganda message.

The covert nature of black propaganda and the difficulty of identifying the true source also hinder the enemy's counterpropaganda efforts.

Disadvantages

Stringent and compartmented precautions are required to keep the true identity of the source hidden.

As covert PSYOP seldom use regular communications channels and must copy enemy characteristics, they are difficult to coordinate with the overall PSYOP effort.

Covert operations may be difficult to control because covert PSYOP operating agencies are decentralized.

Stringent security requirements and long-term campaign plans limit flexibility.

These operations are extremely vulnerable to discovery, manipulation, and elimination (of equipment and personnel) when operating within enemy territory.

These operations normally require special personnel, procedures, and equipment available from US agencies outside the US Army.

GRAY PROPAGANDA

Propaganda which does not identify with and cannot be identified with a source is known as gray propaganda.

Advantages

Skillfully used, gray propaganda can:

- Gain acceptance by avoiding the stigma of being "propaganda."

- Use unusual themes without reflecting on the prestige of the originator.

- Introduce new themes based on assumed vulnerabilities without identifying the true source. It can, therefore, be used for "trial balloon" purposes.

Disadvantages

- It is limited by the difficulty of keeping its origin unknown yet authoritative.

- It may be vulnerable to critical analysis, thereby losing effectiveness and making it highly susceptible to counterpropaganda.

COVERT RADIO OPERATIONS

Clandestine radio is a major medium for dissemination of black and gray propaganda. The radio transmitter is normally operated by indigenous personnel of the target country or by third country nationals. As US military personnel may have an advisory role in covert radio operations, they should be aware of the inherent vulnerabilities of this medium:

- All radio communications are susceptible to detection, identification, and location by enemy direction-finding equipment. Consequently, when operating in enemy territory, the operation must be flexible enough to allow displacement of the transmitter.

- Mobile transmitters are normally low-powered and so must be near the target audiences, or a higher powered conspicuous antenna system may be required. In addition, their power source, whether AC or DC must be maintained.

TACTICAL DECEPTION

Psychological operations have a major role in supporting tactical deception operations, which essentially are unique psychological operations. The basic targets of tactical deception operations are commanders and their staffs, whose perceptions and subsequent actions will determine the success or failure of these operations.

PSYOP support tactical deception operations by disseminating information that supports or confirms the deception story and its objectives. In order to lend effective support, it is essential that PSYOP personnel coordinate at all levels of command in the planning and execution of these operations, primarily with the G5, G2, G3, and commanders.

Propaganda supporting tactical deception operations is disseminated by a mix of all available and appropriate media and means. Support is rendered by employing tactics, techniques, and procedures that mislead the targets. For example, in night operations this can take the form of using loudspeaker teams to mislead or confuse the enemy by producing sound effects simulating battlefield noises and movements. PSYOP units can publish leaflets, pamphlets, posters, and newspaper items, and use a mix of all other media and means, including interpersonal communications and rumor, that will assist in achieving tactical deception objectives.

The national unit aspect of tactical deception operations can be assisted by judicious use of PSYOP media.

*Chapter Eight***8**

PSYOP IN SUPPORT OF PRISONER-OF-WAR AND CIVILIAN INTERNEE PROGRAMS

RESPONSIBILITIES

In accordance with US policy and international law, care and custody of prisoners of war (PW) and civilian internees are command responsibilities. The Staff Judge Advocate is responsible for providing guidance and staff assistance concerning the application of treaties and the law of war. The Provost Marshal at each level of command is responsible for the development of policies, plans, and procedures. The PW camp commander is responsible for all activities conducted within the PW camp.

The degree of PSYOP support required in the conduct of PW activities may be minimal or more extensive, dependent upon DA policy and other factors attendant on a specific conflict and PW attitudes in a given camp.

Use of Civilians, PW and Civilian Internees	8-6
Anti-Enemy Organizations	8-6

PSYCHOLOGICAL OPERATIONS

The general objectives of PSYOP in support of PW and civilian internee programs include:

Conditioning individuals to accept camp authority and regulations during internment. The resultant smooth operation of the camp:

Supports the basic custodial mission of the camp.

Minimizes diversion of combat troops for guard duty.

Minimizes disruption of operations by activist pro-enemy prisoners.

Provides a useful basis for surrender appeals to enemy troops.

Denies the enemy opportunity to make unfavorable propaganda claims of US mistreatment of prisoners-of-war and internees arising out of incidents resulting from suppression of PW disturbances.

Supports US policy of encouraging the enemy to treat US prisoners well (at least according to the Geneva Conventions).

Persuading individual PWs or internees to understand and accept US goals. Achievement of this objective may lead the PW or internee, in accordance with US policy and international law, to:

Assist the in-camp PSYOP program.

Aid PSYOP aimed at other populations.

Contribute to the maintenance of order and discipline within the camp, and nullify hostile activity by pro-enemy activities.

Become, after repatriation, a supportive element of US objectives.

OPERATIONS

PSYOP personnel should work with interrogation teams. When applicable, interrogation personnel assigned to PSYOP FC (Current Intelligence) teams may be used to conduct interrogations and gather intelligence needed for media and operations. Timely intelligence for PSYOP use should be obtained as soon as possible after capture of prisoners of war. Prisoners of war, internees, defectors, and line crossers are representatives of broader target groups. They are, therefore, sources of intelligence for target research and analysis and can be used to pretest PSYOP material.

PRISONERS OF WAR

International law determines who will be given prisoner-of-war status. This category (PW) does not include all hostile personnel detained by US forces, but it does include many kinds of personnel other than members of the regular armed forces. A detailed definition is given in AR 633-50.

Treatment of prisoners of war is governed by the Geneva Convention Relative to the Treatment of Prisoners of War of August 12, 1949 (GPW). The GPW is a matter of international law. It is a treaty to which the US is a party, and, as such, it is a part of US law binding on the US Armed Forces.

Certain provisions of the GPW directly affect psychological operations by setting limits for permissible treatment. Pertinent articles are quoted below:

Article 7: Prisoners of war may in no circumstances renounce in part or entirety the rights secured to them by the present Convention.

Article 13: Prisoners of war must at all times be humanely treated... Likewise, prisoners of war must at all times be protected, particularly against acts of violence or intimidation and against insults and public curiosity.

Article 14: Prisoners of war are entitled, in all circumstances, to respect for their persons and their honor.

Article 38: The detaining power shall encourage the practice of intellectual, educational, and recreational pursuits.

Beside observing the prohibitions of GPW, PSYOP should exploit compliance with the requirements and proscriptions of GPW for specific kinds of treatment, including, but not limited to:

Healthful living quarters (Art 25, 29).

Clean messes and adequate rations (Art 26).

PW clothing suitable to the climate; that is, clean and in good repair (Art 27).

Camp canteens where PW may secure foodstuffs, soap, tobacco, and ordinary articles of daily use (Art 28).

Medical facilities and medical care (Art 30, 31).

Freedom of religious observance (Art 34).

Gainful employment of PW in suitable working environments at work having no military character or purpose (Art 50, 51).

Pay for work performed (Art 62).

For further information concerning handling of prisoners of war, consult Standardized National Agreements (STANAGs) 2033, 2044, and 2084.

POLICY AND PLANNING CONSIDERATIONS

Specific policy guidance governing the establishment, objectives, and conduct of PW and internee PSYOP programs is contained in Department of the Army directives published with the outbreak of hostilities. Appropriate guidance is forwarded through command channels to the PSYOP unit committed to the program and to the camp commander for implementation.

Prisoners of war, particularly after extended internment, constitute a highly volatile and sensitive security problem of a nature which is completely unique to PW camps. All PW doctrines and camp activities must therefore be evaluated critically in the light of this problem.

Procedures and programs which have been generally successful may have unexpected and undesirable results if applied without appropriate adjustment to special circumstances and individual target audiences.

GUIDANCE TO IMPLEMENT ADJUSTMENTS

Guidance at all levels of command to implement adjustments should be clear enough so that consistency is maintained, and there is no misunderstanding at subordinate levels. At the same time, guidance should be flexible enough so that subordinate operators are not overly restricted in adapting command guidance to the characteristics of the particular target population. Operations and procedures must be responsive to changes in the situation, to new information, and to lessons learned.

LIMITATIONS

Strict attention must be given in the planning process to limitations (explicit and implicit) in national policy and international law pertaining to the treatment of prisoners of war. United States policy is to place a broad interpretation on the Geneva Convention pertaining to prisoners of war, and to establish protection in excess of the minimum required by a narrow view of GPW.

PROHIBITIONS

Prisoners of war will not be used, even voluntarily, to contribute directly to PSYOP in such ways as preparing signed statements or tape recordings. Individual identifiable photographs implying active contribution to propaganda will not be used.

PROGRAMS FOR PRISONERS OF WAR

Subject to security considerations and camp discipline, PWs and internees are encouraged to participate in information, education, and recreation programs and activities. Programs include formal and informal instruction in basic educational subjects and vocational training.

INFORMATION PROGRAMS

Information programs are a sound basis from which to initiate other types of programs. Straight news reports may be the best first step in a phased operation aimed at pro-enemy and activist PWs and internees. Reports of enemy failures or losses should be published, posted, and broadcast. When possible, use enemy news sources without commentary. Permit the PWs to draw their own conclusions.

EDUCATION PROGRAMS

From a PSYOP point of view, appropriate courses for a PW and internee education program include:

- A history of the war and its causes.

- A comparison of the origins and developments of a democracy as opposed to a totalitarian form of government and ideology.

- Life in the free world.

- Leadership development and skills in group action.

- Reconstruction plans and the way they affect prisoners of war.

VOCATIONAL TRAINING

Vocational training, e.g., technical, agricultural, etc., is an important part of the education program.

Such training will assist the PW or internee in preparing for repatriation. This may motivate him to perform well and give him more favorable attitudes toward the United States.

At the same time, the program may supplement the camp food supply, contribute to camp construction and maintenance, and reduce the costs of internment to the United States.

Some nationalities or groups may resist many types of vocational training. To insure success, programs must be based on target analysis.

INFORMAL PROGRAMS

The informal program reaches into all phases of PW everyday life. Subject to the limitations discussed earlier, and the wishes of the PW compound commander, PSYOP informal programs should be carefully designed and conducted to achieve the objectives of the camp commander and the PSYOP program. These programs are continuous throughout internment. The general treatment of the PW and internee is a major part of the informal psychological operations program.

IMPLEMENTATION OF PSYOP PROGRAM

In general war, a PSYOP battalion (prisoner of war) may support the theater military police prisoner-of-war command.

The battalion advises and assists PW camp commanders in planning, implementing, and supervising the PW education program. It also assists in:

- Interrogating PWs for information essential and peculiar to PSYOP.

- Pretesting PSYOP material for possible effect before dissemination.

- Determining the effectiveness of selected PSYOP programs.

USE OF CIVILIANS, PW AND CIVILIAN INTERNEES

Where languages other than English are spoken, language-qualified teachers from allied countries are normally employed. This may, however, be undesirable when the available nationality is resented by the target population.

Carefully selected, qualified PW and civilian internees may be used as instructors as long as they are under the supervision of camp authorities and their use is in accordance with US policy and international law. This is desirable psychologically, because it involves the target population in the program. However, security considerations and lack of supervisors may curtail this type of program.

ANTI-ENEMY ORGANIZATIONS

In inclosures classified as "political defectors," "probable anti-enemy," or even "nonpolitical," formation of anti-enemy groups should be encouraged, but their activities controlled. Such groups make it easier to channel the energies of the PWs or internees to US purposes. Such groups also tend to counter the activities of pro-enemy groups and agitators.

Anti-enemy PWs and internees can be used as advisors in the administration, education, and exploitation of neutral and pro-enemy PW and internees.

The training and performance of PW and internee instructors and other cooperating personnel must be closely monitored to insure that hostile elements in the group are not subverting the effort and using training sessions and facilities to harm US interests and to disrupt camp discipline.

Active pro-enemy PWs may deliberately destroy equipment, waste supplies, sabotage projects, subvert camp authority, and undermine US influence and control.

Educational and PSYOP equipment and facilities, such as classrooms, meeting rooms, and reproduction and sound equipment, must be secured to assure that they are not being used for anti-US activity. Sports and vocational training equipment should be controlled so that it cannot be converted to weapons.

PSYOP officers participate in contingency planning for control of disturbances in camp compounds. Designated PSYOP units participate in rehearsals and disturbance control.

PART TWO

PSYCHOLOGICAL OPERATIONS FOR THE PSYOP COMMANDER/ UNIT/STAFF

Chapter Nine

BEHAVIOR FACTORS

The psychological operator's key to success is knowledge--knowledge of why people behave as they do and how to persuade them to behave in a more desirable manner. This chapter presents a treatment of this subject. Technical terms, which are not self-explanatory, are found in appendix H.

The target audience is guided and limited by social and psychological factors. The psychological operator must recognize the factors influencing individual/group behavior, use these factors to gain the attention of the target audience, and communicate with and motivate the target audience to alter their behavior and attitudes. The principal psychological factors to be examined are **perception, motivation, frustration, and attitude**.

Motivation.....	9-5
Frustration.....	9-7
Attitude.....	9-11

PERCEPTION

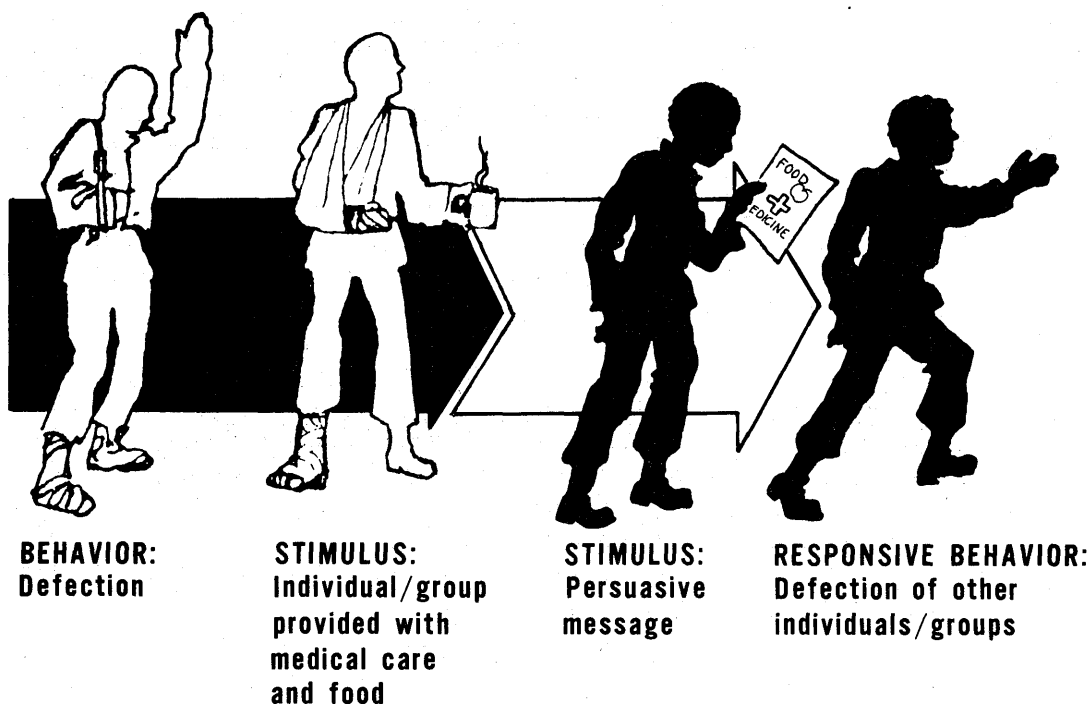

The perception of the target audience is influenced by biological (or physical) capacities, frames of reference, learning, past experiences, and cultural and social environments. Knowing these influencing factors helps in determining the stimulus which will affect the target audience.

The individual is in contact with his environment through the general sensory systems. The sensation acquired by stimulating the sensory systems is influenced by cultural preferences. For example, as the result of his cultural background, an individual will exhibit a preference for a given color (visual), a particular style of music (aural), a certain odor (smell), a special taste, and/or a particular touch. These sensory preferences enhance group unity and individual identification with the group. They have the power to act as a stimulus, causing desirable behavior to occur.

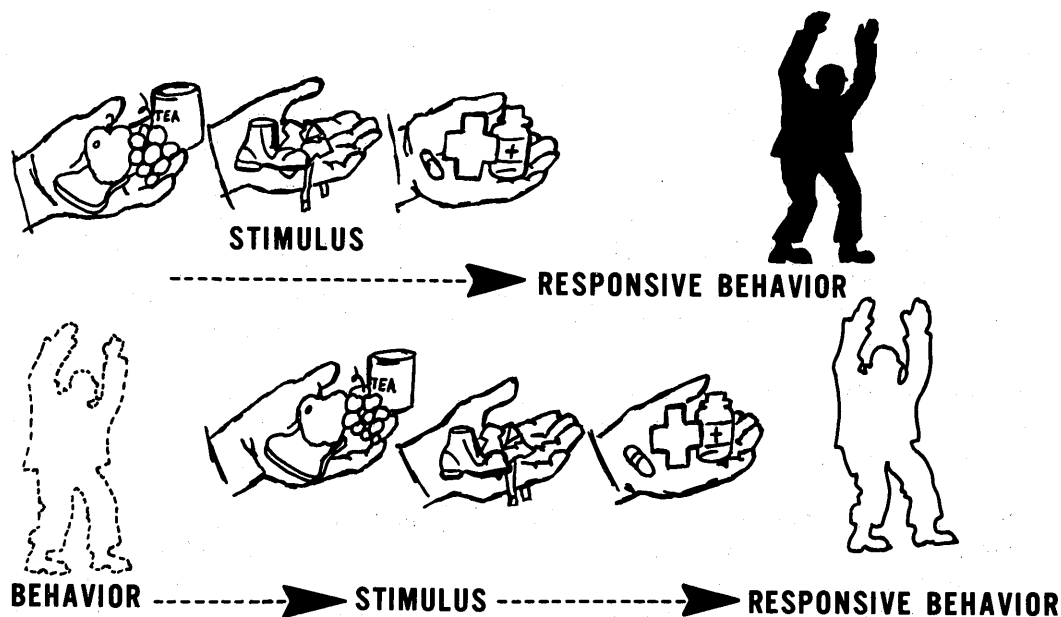

In determining the influencing stimulus, the psychological operator has two approaches. The first approach involves defining the behavior to be changed and identifying the cause of that behavior. By closely examining the target audience's language, customs, mores, tradition and habits (folkways), laws, and values, the behavior and its cause are properly interpreted within the target's culture.

The stimulus may not be found in the above cultural variables. To overcome this problem, a second approach suggests the behavior be observed and numerous stimuli be presented to an individual or group to determine which stimulus causes a desirable response. By providing medical care, food, or other stimuli after an individual or group has defected, other potential defectors will be prompted to defect, expecting medical care, etc.

In some instances neither the stimulus (cause) nor the behavior are observed, leaving the responsibility of presenting a stimulus and inferring a responding behavior to psychological operations personnel. The stimulus (cause) must be consciously evaluated (perception) after it is received by one or more of the sensory systems.

The key to influencing the evaluation process is found in the presentation of an attention-gaining sensory image. The attention-gaining factors may be categorized into those perceived externally and those perceived internally. The external attention-gaining factors are intensity and size, contrast, movement, repetition, and novelty. These factors when employed by the psychological operator may stimulate the target audience to a more desirable behavior.

The **intensity** of a loudspeaker or leaflet operation can strongly affect those near the loudspeaker or see the leaflet. The attractiveness/repulsiveness of the sound or the appealing/shocking color of a leaflet gains attention. **Size** is relevant. The fundamental principle is that the most stimulating intensity or size is defined by the culture of the audience.

Perception of a stimulus is often influenced by the degree of **contrast** between an object and its background. The conspicuous difference may be used to gain the attention of a target audience. Contrast may be created through differences in color, shape, or intensity between the propaganda and its background or between the propaganda and other disseminations. For example, orange leaflets are attention gaining when the operation is conducted in green jungle foliage. The factor of contrast is easily employed, but an effective contrast is dependent on the cultural definition of the degree to which contrast is tolerable.

The factor of **movement** involves the stimulation of the visual and aural senses. To gain the attention of a target audience, a perception of motion must be created. The best possible attention-gaining situation is the creation of movement against a motionless background. This factor may be employed for the visual sense by a television production, or by movement on printed matter created through suggestive eye direction or mechanical eye direction. Movement can be created for the aural sense by the use of a loudspeaker to duplicate the movement of a troop unit (cover/deception).

The attention-gaining factor of **repetition** is one of the most difficult to employ. The target audience's probability of perception is increased by repetition as well as their sensitivity to a particular sight or sound, but prolonged repetition may reduce the attention-gaining potential of the stimulus. To prevent this, an intimate knowledge of the culture must be available to sense when a stimulus is losing its potential.

A stimulus may be quickly perceived if it is a new sight or sound and is markedly different from the old, more familiar stimulus. It is the innovative approach of the psychological operations personnel that forms the bounds of **novelty**, for a new, markedly different stimulus may be the one perceived by the target audience.

The internal attention-gaining factors are motivation and set. In contrast to the external factors that attempt to create a predisposition, these factors concentrate their attention-gaining potential on the target audience's predisposition to a behavior.

The factor of **motivation** relies on the target audience's conscious, learned, and goal-directed predisposition. Members of a target audience may be predisposed to acquire security for their families. By explaining the benefits of defecting in a persuasive message, the attention of members of the target audience may be gained and this predisposition reinforced.

The **set** is an unconscious vague awareness that focuses the attention of the individual or group. For example, refugees wandering aimlessly along the main line of communications, suffering from cold, hunger, and other physical discomfort, will be attracted to a persuasive message that offers warm clothing, lodging, food, and medical care and will not be attracted by appeals to return to their homes or to conduct sabotage.

MOTIVATION

The psychological operator by utilizing the guiding components of perception can create **motivation** toward more desirable behaviors (i.e., individual defections or group surrender).

Research must begin with a close study of the target audience's culture. The research provides detailed knowledge of their needs, whether the needs are unconscious predispositions to sustain life (drives) or drives consciously learned (motives). The needs may not be perceived by the target audience, or its members may not know how to satisfy them. Psychological operations personnel are responsible for guiding and/or stimulating perception of the needs that are found in the form of drives to more desirable behaviors and for redirecting and/or stimulating perception of needs/motives to other more desirable behaviors. A behavior to relieve hunger may be stimulated and guided by a persuasive message. The message may state where and how food can be acquired if the individual or group surrenders. In each instance the need creates a behavior that is goal directed; an individual or group is driven or motivated toward culturally defined goals; i.e., a soldier is persuaded to surrender and receive food to satisfy his hunger.

The needs of an individual or group are continuously appearing in the form of drives and motives to stimulate behavior toward a goal and the simultaneous satisfaction of a need. As a need is satisfied, other needs may appear to be guided, redirected, and/or stimulated. The appearance of other needs begins the motivational cycle anew as shown below:

Motivation begins with a need. This gives rise to instrumental behavior which, if successful, leads to a goal. This, in turn, relieves the need.

FRUSTRATION

The target audience is not always successful in attaining its goals. When a desired objective/goal is not achieved, an individual or group tension/inner conflict is created: **frustration**. It is the task of the psychological operator to recognize the sources and results of frustration. With a deep understanding of these factors, frustration can be used to channel the target audience into more desirable behaviors.

The individual's or group's frustration comes from three sources: environment obstacles, physical and/or mental limitations, and motivational conflicts.

The individual or group may perceive, unconsciously or consciously, a need for food, ammunition, and medical supplies. The psychological operator may utilize environmental obstacles to block access to these needs, such as communicating that friendly troops have captured the target audience's supplies or are otherwise preventing the target audience from satisfying its needs. The environmental obstacles are of benefit only if the obstacle channels the target to other need-satisfying behavior; i.e., defection or attacking a planned ambush site.

Members of the target audience may perceive a need but be physically and/or mentally unable to achieve satisfaction of the need. The persuasive approach to achieve needs must be physically and mentally accessible to the target audience to channel need-satisfying behavior. This implies a psychological operations message must be composed of the culturally determined language and words. The message presented must be culturally acceptable, it must be presented on the target's intellectual level, and any action required must be within its physical capabilities.

The internal tension or motivational **conflict** of the individual or group arises when two or more equally important needs are incompatible with its goals; when two or more undesirable but necessary needs are incompatible with its goals; or when one need is desirable and the other is not and the goals are incompatible, yet each need requires simultaneous satisfaction. These conflict conditions are categorized as approach-approach conflict, avoidance-avoidance conflict, and approach-avoidance conflict.

Under the condition of **approach-approach conflict** in which the needs are equally desirable with incompatible goals, one **need** must be presented as more important than the other, or one **need** as undesirable while channeling the target audience's need-satisfying behavior. Similarly, the incompatibility of goals can be brought to the attention of the audience to reinforce the need selected for a persuasive message. A group, for example, may desire to totally commit itself to fighting for its country and equally desire to survive. Both needs are equally important to the group, but the psychological operator may imply the goal of fighting is incompatible with the goal of surviving and suggest the group survive by defection rather than die fighting.

The condition of **avoidance-avoidance conflict** presents two undesirable needs and incompatible goals to the individual or group. For example, the individual may find it undesirable to fight (need) and undesirable to die at the hands of a firing squad for cowardice (need). Likewise, the goals of not fighting and not dying due to cowardice are incompatible. A persuasive message may imply that the individual should defect and avoid fighting; if he decides not to fight, he will die.

The **approach-avoidance conflict** is a condition in which there is a desirable need, an undesirable need, and a desirable goal. The individual may desire to fight (need) for the honor of his country but finds dying to be an undesirable aspect of fighting. The goal to survive brings fighting for honor and imminent death as a result of fighting into conflict. The psychological operations personnel may appeal to the individual's desire to survive, building up the need to survive and downgrading the need to fight.

By channeling need-satisfying behavior toward defection as a means to survive and avoid fighting, the PSYOP mission is successful.

The results of frustration can be constructive for our forces, disruptive for the individual or group, or manifested in defense mechanisms which draw the individual away from persuasive approaches.

The constructive results of frustration are:

If an individual or group is persuaded to perceive needs which neither he nor his group can satisfy, the individual may **intensify** striving to escape from the group or to make changes in the group.

The individual or group may be persuaded to such an extent that **the means are changed to goals**. Defection may have been a means to survive, but the persuasive argument may be so strong the individual or group may defect not for survival but to defect.

The frustration may cause the individual/group to **substitute goals**. This is a key result for the psychological operator if the substitute goals are provided by him (i.e., defection or surrender).

The individual or group may be persuaded by the psychological operator to **redefine the situation** (i.e., battlefield environment) to one that is undesirable, if not untenable. In which case, the target may be persuaded to defect or become subversive.

The disruptive results of frustration are:

If the individual is not given a means to satisfy his need/goal within his own culture, his frustration may be channeled **against himself**, his group, or into aggression against our forces. It is the responsibility of the psychological operations personnel to provide a means to satisfy his need/goal and thereby subvert the individual or group.

The individual or group may be blocked from satisfying needs/goals to such an extent **escape** is the only alternative. By knowing the needs of the individual or group, a persuasive message may offer to satisfy needs/goals as additional motivation to escape/defect.

The frustration of the individual or group may result in an increase in **anxiety/conflict**. By recognizing anxiety-producing situations, a means of relieving the conflict can be provided and a more desirable behavior acquired.

As anxiety/conflict increases, the group will unconsciously constrict its environment to protect itself from dangerous instinctual demands and conflicts. The protection is offered in the form of defense mechanisms which repress some aspect of reality and reconstruct that aspect in a manner helpful to the group's enhancement and approval. The objective of the psychological operator is to eliminate the reasons to develop mechanisms or to guide defense mechanisms to more desirable behavior. The most common mechanisms of defense are repression, displacement and sublimation, fixation, regression, projection, denial, reaction, formation, identification, and rationalization.

The individual/group may receive stimulation to perform a certain behavior. Due to the defense mechanism of **repression**, the stimulus and its associated behavior are forgotten and held in the individual's/group's unconscious memory. A defection message may be received, ignored (behaviorally), and held unconsciously due to the dangerous demands and conflicts defection implies.

The defense mechanism of **displacement** is characterized by repression of a source of anxiety/conflict and attributing the tensions to another source. A closely related mechanism, **sublimation**, applies the characteristics of displacement and the characteristic of anxiety/conflict being expressed in other than the routine manner. Displacement could be employed by an individual/group blaming the intolerable living conditions on other individuals/groups rather than the real source, the individual's/group's leader. The mechanism of sublimation could depict the target audience as physically striking out at other individuals/groups rather than using their routine verbal manner of expression.

In another anxiety/conflict ridden environment, the group may defend itself by **fixation**, a temporary or permanent halt to the group's development. This may mean the group will no longer follow the progression of persuasive messages due to the anxiety/conflict they produce.

The mechanism of **regression** results when anxiety/conflict cannot be reduced, forcing the individual/group to suppress the anxiety/conflict and return to a time when the tensions were not present. For example, the individual/group may be subjected to persuasive messages that stimulate the individual/group to think back to more pleasant times and block out the intolerable conditions the persuasive messages revealed.

The tendency of the individual to attach to others the motives which he senses within himself, but might be painful to acknowledge, is labeled as **projection**. A persuasive message could point out the benefits of defecting. The individual may not believe the message; if he were writing a similar message, he would use the same tricks to draw other individuals/groups out of hiding. The individual has, in this example, attached his devious motives to the persuasive messages of others.

The group may attempt to deny the existence of an anxiety/conflict-producing source. By employing the **denial** mechanism, the group may deny the need to defect; to it the problem of poor medical attention no longer exists. This feeling is in opposition to the reality that medical attention remains poor.

The anxiety/conflict produced is often repressed and new behaviors are developed to reflect an opposite side of the individual/group. This defense mechanism, **reaction-formation**, is characterized by extreme behavior inappropriate to the situation. This protective mechanism, when expressed in a persuasive message to defect and live for another day, may be met by an increase in aggressive resistance. The individuals want to

defect, but this is so foreign to their commitment that they must repress the desire and fight with renewed resistance.

The defense mechanism of **identification** leads the individual to repress his anxiety/conflict and model/imitate someone who is feared, loved, or admired. These factors could portray an individual/group repressing his inadequacies and imitating the successful approach of a feared leader.

The individual/group can protect itself by **compensation**; that is, failure is repressed and overachievement in a related skill is pursued. Failure to be a marksman could lead to the individual's/group's overachievement in the skills of supply, first aid, or communications.

By using the defense mechanism of **rationalization**, the group attempts to justify its behavior and presents itself to be righteous to both self and other groups. Through this protective mechanism, the group can defect honorably if the justification is accepted as best for the group or country.

ATTITUDE

The individual/group is so structured by culturally determined sensory perception, stimuli, motivation, and frustration that the psychological operator must find an influential key to their culture. This key is attitudes which positively or negatively orient the individual's perception, motivation, and frustration.

Attitudes are important for they influence reactions, are reflected in behavior, exert a consistent influence, are subject to change, and subsequently influence behavior. More specifically, attitudes influence an individual's/group's orientation to his/its culture. By closely observing the orientations, a consistent influence can be observed in a wide variety of behaviors directed toward someone or something. Conversely, as attitudes are reflected in behaviors, behaviors reflect the attitudes of an individual/group. A primary objective is to identify the key attitudes of a group that when changed will make it vulnerable and susceptible to a persuasive message.

The influence of attitudes can be distinguished on three major levels: the cognitive, the emotional/affective, and action/behavioral.

- 1 The **cognitive level** is the inner orientation of an individual/group which serves to construct a picture of someone or something. The orientation is particularly concerned with the perceptions, beliefs, and the common traits attributed to someone or something. The individual/group may picture others as lazy, mentally inferior, unpatriotic, treacherous, ruthless, bloodthirsty, or cowardly.
- 2 The attitude may orient the individual/group to express certain feelings when a given stimulus is presented. The feelings, found on the **emotional level**, may be presented by fear, anger, hatred, contempt, envy, pity, sympathy, or love. The appearance of a massive force may stimulate the individual/group to invoke the emotions of fear, anger, or hate.
- 3 The **action level** for the individual/group refers to the tendency or disposition to act. A persuasive message which exposes the intolerable living conditions may create a tendency for the individual/group to defect.

Having explained the concepts of perception and its attention-gaining factors, motivation and its origin and goal, frustration and its sources and results, they must be applied to influence foreign

policy decisions, the determination of military missions, the ability to govern, the ability to command, the will to obey and support, and the will to fight. Despite the magnitude of the task, the principles can be expressed in a single term, attitude change. This collective term represents the relationship between the psychological operator's desired attitudes (and more desirable behavior) and the individual's/group's attitudes as well as the degree of receptiveness between the individual/group and the psychological operator (change agent). The psychological operator may bluntly suggest the individual/group accept defection as a reasonable alternative to fighting, an action for which the individual/group has a negative orientation (attitude). In this situation, receptiveness has not been cultivated in the individual/group and an attitude change has been suggested that is in direct opposition to the individual's/group's orientation.

The more subtle approach to attitude change is expressed by the concepts of compliance, identification, and internalization.

The psychological operator may frequently employ coercion or force to imply the individual/group will be rewarded or will gain approval and avoid punishment/disapproval if his behavior complies with that specified by the psychological operator. The **compliance approach** allows the desirable attitude to replace the more traditional attitude; if a reward is not provided as implied or punishment does not cease, the individual/group will change back to the traditional attitude and behavior. This approach insures short-term behavior compliance but may produce a negative attitude in the target audience.

The **identification approach** depends on the receptiveness of the individual/group and the gratifying relationship between the psychological operations personnel and the individual/group. Under ideal conditions, the individual/group models itself after the psychological operator due to the desirability of the relationship. The willing commitment involved in this approach to change is more likely to persist for it is not dependent on reward or the avoidance of punishment.

The most significant attitude change, yet the most difficult to achieve, is internalization. The **internalization approach** identifies attitudes that can be used to accomplish our goals yet be consistent with the accepted attitudes of the individual/group. If consistency is gained, long-lasting individual/group attitudinal and behavioral changes will result.

In support of the approaches to attitude change, social support, support of experts, and support of experience can be used to lend credibility to attitude-changing messages.

The social pressure brought by **social support** forces the individual/group to conform to a more desirable attitude if a reward of social acceptance, prestige, increased status, esteem, praise, achievement, and recognition is expected. It is the psychological operator's objective to amass social support and build on that support; i.e., persuading a group to defect and using their name to illustrate to others the rewards received for their behavior.

The **support of experts** that are knowledgeable or powerful provides the stimulus for individuals/groups to change their attitudes. The psychological operations personnel can quote these experts or enlist their assistance as key communicators (see chapter 10) to bring about persuasive attitude changes.

The **support of experience** is the most powerful tool available to use in attitude change for it calls upon individual/group perceptions to point out their attitude is consistent with the attitude and behavior sought by the psychological operator.

*Chapter Ten***COMMUNICATING**

Communications can arouse needs and emotions and persuade a target audience to change attitudes and subsequent behavior.

This chapter will provide an understanding of communications and their importance to PSYOP.

THE COMMUNICATION PROCESS

Communications, the exchange of information and ideas, is possible only to the degree that individuals have common knowledge and interpretation of the language used. It is the primary PSYOP method for arousing needs and emotions, and changing opinions and attitudes.

Social communication is the process of exchanging ideas, sentiments, and beliefs, usually by use of language, but also by visual representation and imitation. In human groups, it is largely a process of social interaction.

Words, the basic component of language, permit the expression of ideas and play a basic role in changing the environment, thus affecting culture and society. The planned use of words can bring about lasting changes in behavior, concepts, attitudes, and emotions.

Language, as the means of communication, performs three vital functions in every culture:

The most basic function is informing individuals and groups by using the stable and commonly agreed upon meanings of words, symbols, or actions.

The psychological effect of language is an extension of the informing function. By informing, it arouses the emotions of the target audience and produces a psychological effect on others. It influences them to react with a desired activity or attitude, such as fear, apathy, sympathy, pity, dissatisfaction, verbal confrontation, or aggressive action.

The ritual function creates and reinforces the attitudes strongly associated with particular institutions, such as the church, mosque, temple.

In practice, it is almost impossible to separate the functions of language. The difficulty arises when language has the primary function of arousing emotions and stimulating actions, while the target is led to believe that it is being given the facts about actual events. This is best illustrated in the fields of political and economic discussion where terms such as "liberty," "democracy," "imperialism," and "free enterprise" perform all three functions simultaneously.

In **persuasive communications**, attention must be paid to three important factors: transmission, interpretation, and the communications situation.

Communications must be transmitted and interpreted within the framework of a particular society or culture. Too often, an operator erroneously uses the most readily available means of communications, even though it is not the most effective channel for reaching a particular target audience. Each society is affected differently and in varying degrees by mass media, interpersonal communicators, and the numerous formal and informal groups, such as the family, church, occupational clubs, gangs, and cliques; work, pub, and cafe cronies; professional, art, and cultural societies and colleagues. Each serves a communications purpose within a society, differing in its credibility and impact according to subject matter.

The communications situation must be closely examined. The psychological operator must know who is listening to his appeals, who is looking at his visual and audiovisual propaganda, and who is reading his message. He wants to be certain that the target he wants to affect can be affected by the **communications channel** he intends to use. It is a waste of resources to use radio when newspaper or magazine articles have the greatest impact, or to use printed media when radio has the greatest credibility and effect.

Not only must the communication be based on facts and reality, and the media be appropriate to the audience, but the message must also be appropriate to the situation in which the audience finds itself. The psychological operator must also give thought to the options to act available to the target. The most effective message will be that which makes sense (is rational) to the target audience, furthers the target's self-interest, and is to it moral and ethical. The psychological operator should present his appeals in that light.

The communications process involves four steps: gain attention, hold attention, have an acceptable message, and acquire feedback.

GAIN ATTENTION! Prior to launching a persuasive message, the analyst must be sure the message will gain the attention of his target audience and stimulate perception. This demands a message that will successfully compete against other events, appeals, persuasion, threats, demands, etc. The impact of the message must focus attention on the message and be appropriate for each target. The opening that will gain the interest of the farmer may be completely ignored by the school teacher. The opening that will enthrall the religious leader may leave the union organizer apathetic. If the persuasive message has the desired attention-gaining quality, it will be evaluated by being read, listened to, and being looked at.

HOLD ATTENTION! Once gained, attention cannot be permitted to waver. The target must read it all--listen to it all--or view the entire visual presentation. This requires that the communication be couched in the common language of the target, the language which affects its emotions (individually and collectively). A basic means of accomplishing this is to use words, symbols, and actions similar to those associated with persons whom, in memories of youth, the target recalls as loved and respected authorities; i.e., parents, teachers, friends, clergy, etc.

HAVE ACCEPTABLE MESSAGE! Having been listened to, looked at, or read in its entirety, the message must be accepted. It must appeal to the dominant interests of the target audience, offering THE SOLUTION to the most urgent problems of its members. This requires that the message delineate lines of action appropriate to the target in his or her situation. Propaganda will be most readily accepted when it refers to feasible actions that the target can perform with integrity. The test is a simple one: The propagandist must put himself (figuratively) in the target's situation and ask himself (as the target), "What would I do under these conditions? Accept the message or ignore it?"

Use media that the target trusts and that has the greatest impact. The target will not readily accept messages in media that he or she does not trust nor consider authoritative.

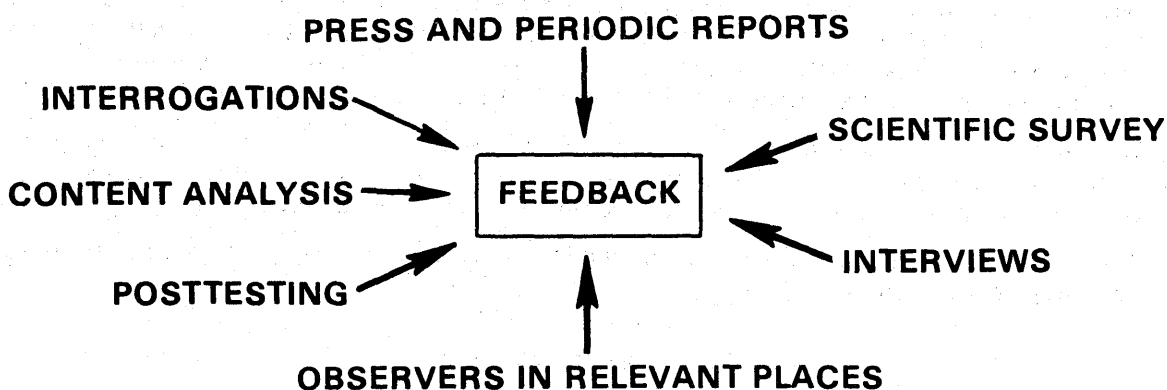

The message must be credible (believable) to the target. But it need not be unbiased in fact. Credibility is in the mind(s) of the individual or group who judge the message in terms of their own experiences, not solely on fact. The message that does not focus on the important interests of the target; does not offer the best realistic solutions to their problems; and is not presented in the appropriate language, in media and format, familiar to and respected by the target, will suffer from a lack of credibility.

The psychological operator cannot know whether his propaganda was incredible, credible with no impact, or credible to the point of affecting the actions and attitudes of the target, as desired, until he receives feedback.

FEEDBACK! Feedback is information that reports the effects, or discrepancies between the intended and actual effect, of a PSYOP campaign. Analysis of feedback should lead to modification of a campaign to improve its effectiveness.

Feedback must be target oriented, considering differences in the subgroups that may constitute a major target group and situational changes which occur with drastic rapidity in time of conflict.

Feedback requires systematic research:

Interviews conducted with carefully chosen members of the target groups should determine campaign results, and if possible the reasons for those results, by seeking factors such as morale, attitudes, overt behavior, and other indicators of the impact of the psychological operator and its propaganda. If the target cannot be reached, informed persons, e.g., refugees, exiles, scholars, reporters, and others intimately connected with and having in-depth knowledge of the area and target, should be interviewed, keeping in mind that each has a subjective point of view. These points of view may be justified, but, nonetheless, they are the basis for biased judgments and statements.

Although other types of feedback indicate success or failure, they will not always tell why a campaign, theme, or message failed or was a partial success. Posttesting will uncover the reason(s) for audience reactions. The techniques of posttesting and pretesting are the same. However, the same persons must not be used.

The propagandist must have total empathy with his target. This does not involve sentimentality nor sentiment. It involves the ability to understand people--the ability to project oneself into the other person's situation and be able to think, see, feel, and reason as he does. This ability is one of the most important requirements in giving common meaning to the message.

The US psychological operator has his message to communicate, but successful communications depend on certain basic requirements:

Personal contact. The success of personal contact with the target audience establishes the effectiveness of communications.

Identifying target audiences. The psychological operations personnel must employ skill in identifying target audiences; in determining their needs, attitudes, vulnerabilities, and susceptibilities; and in selecting the means of communication.

Selecting PSYOP personnel. The criteria for selecting PSYOP personnel should be capability and skill rather than their military versus civilian identification. Neither category has a monopoly on imaginative skill or the ability to influence people.

While the empathetic psychological operator has the skill to put himself into the "role of his target," he must also have the facts to enable him to do so under prevailing conditions. This intelligence must relate to the environment affecting the target. While the physical environment is important, the social attitudes and environment of the target are more important.

To fully understand the process of standardizing and exchanging subjective meanings using words, symbols, or actions, the psychological operator must analyze the components of communication. A means of analysis is a **communication process model** (figure 10-1).

A typical model consists of a stimulus, sender, receiver, message, transmitter, encoding, decoding, feedback, and noise component.

FIGURE 10-1
COMMUNICATION PROCESS

A **stimulus** is any change agent that causes a response.

A **sender** (encoder) is the initiator of the message.

The **receiver** (decoder) is the intended addressee of the message.

The **message** is a word, symbol, or action or a grouping of words, symbols, or actions used and controlled by a sender.

The **transmitter** is the means used for presenting the message; i.e., writing or the human voice.

The **encoding process** is the structuring of words, symbols, or actions to form a message having a shared meaning among individuals/groups.

The **decoding process** is the translation of a message to give it meaning. The ideal situation is to have the receiver translate the message with the shared meaning the sender used for encoding.

The **feedback** is the information returning from the receiver to the sender by the same communications process mode, signaling an acceptance, rejection, or noncommittal response to the message.

The **noise** factor is anything which interferes with the transmission or reception and subsequent perception of the intended message.

If psychological operations personnel are to be consistent in their efforts to form a persuasive communication, they must be concerned with the reasons for the success or failure of the message.

A persuasive message must incorporate variables of policy, intelligence, a general theme, and the command's desired results.

The target must be motivated to perceive a persuasive PSYOP communication (message), in spite of interference with its transmission, reception, and subsequent perception. To meet the challenge, an attention-gaining, stimulating, timely message must be transmitted.

The message is important to the target audience **only if it can be understood**. It is the objective of the psychological operator (encoder) to guide understanding by using words, symbols, and actions that have a known and accepted meaning to the target. For example, figure 10-2 shows the difference of meaning for terms given in standard American and Soviet dictionaries.

Word	Soviet Meaning	American Meaning
Individualism	The individual as a member of a collective.	The pursuit of individual rather than common or collective interest.
Freedom	The recognition of necessity.	Exemption from necessity, in choice and action; as, freedom of the will.
Charity	Help granted hypocritically by representatives of the dominant class in societies of exploiters to a certain fraction of the disinherited sectors of the population in order to deceive the workers and to divert their attention from the class struggle.	An act or feeling of affection or benevolence.
Initiative	Independent search for the best way to fulfill a command.	Self-reliant enterprise; self-initiated activity.

FIGURE 10-2
DIFFERENCES IN MEANING

The immediate goal is to cause desirable behavior which will satisfy **perceived needs**, arouse a perception of **dormant needs**, or stimulate a perception of **new needs**. To accomplish these, the persuasive message must stimulate an awareness of the behavior required to satisfy perceived needs, dormant needs and their satisfying behaviors, or new needs. If stimulation is successful, the individual or group may change their attitude(s) and behaviors as urged or implied by the message.

MASS COMMUNICATIONS

There are two types of message carriers: mass communications and face-to-face communications. **Mass communications** are directed toward selected target audiences with specific needs; the level of communication, the languages and dialects, and the content of the message are tailored to the society addressed; e.g., the blue collar worker versus the executive. Regardless, the individual or group retains the option to select the mass communications it accepts.

It can be looked upon as a two-step process as shown in figure 10-3. **Step one** occurs when the persuasive message is transmitted by mass media to the key communicator. **Step two** occurs when the persuasive message is transmitted from the key communicator to the individuals and groups composing the society.

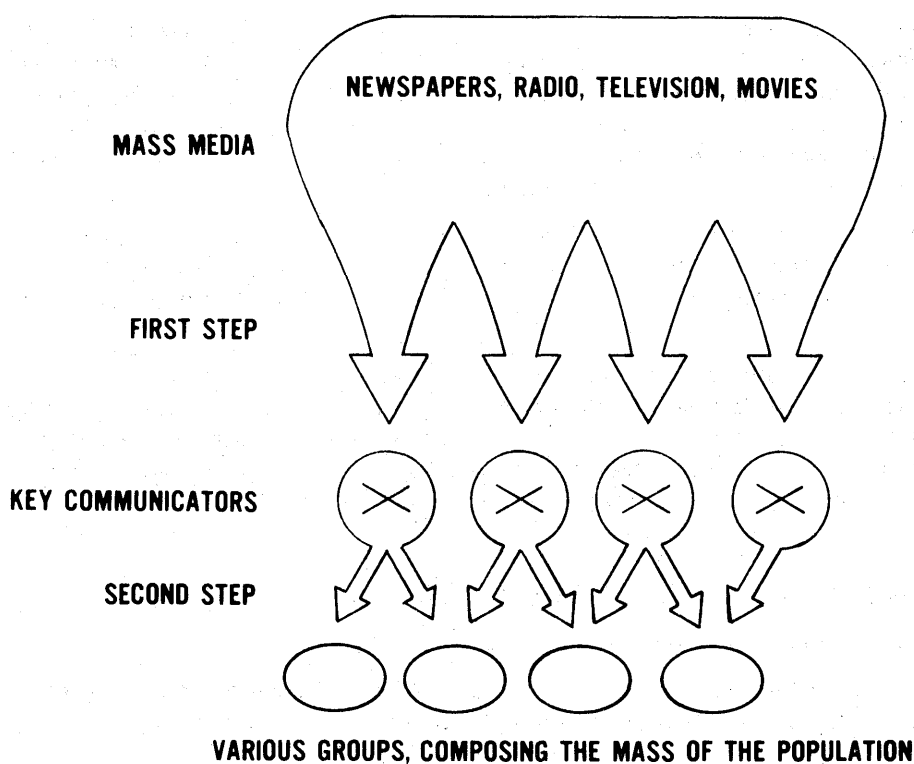

FIGURE 10-3

TWO-STEP FLOW OF MASS COMMUNICATIONS

The reason for the two steps is that mass media does not reach, nor is it internalized by all people. Many who receive the message do not have the desire to internalize it. The key communicator has the time, desire, and ability to receive a persuasive message. It is the intent of the psychological operator to exploit this receptiveness, enlisting the key communicator's help to reinforce mass media and face-to-face communications.

The key communicator furnishes the average individual secondhand information and interpretation concerning that which they have heard, seen, or read. He persuades the individual or group to change or reinforce their opinions, attitudes, emotions, and behavior. The key communicator can reduce the uncertainty of bringing about the desired behavior. He is the one to whom PSYOP messages should be directed.

INFORMAL COMMUNICATIONS CHANNELS

The communications process merely starts with the transmission of the message by way of the mass media. The important step is the penetration of the informal societal communications channels; i.e., the beauty parlor group, the women washing clothes on the river bank, the barbership coterie, the student clique, the luncheon club, the tea (coffee) house, etc. Discussion within these groups keeps the ideas of the propagandist alive and hopefully leads to acceptance and action.

A man's behavior, attitudes, and opinions are most strongly influenced by the groups to which he belongs. The stronger his attachment to the group, whether out of fear, awe, respect, or intellectual or sentimental attachment, the greater the group influences his lifestyle.

The most important institutionalized channels of social communication that must be penetrated are the family, religious center and school, and in totalitarian countries, the governing political party. These institutions are the centers of authority and social control, charged with the responsibilities relating to the primary functions of life; i.e., child rearing, education, companionship, marriage, morality, and death. They evoke the deepest sentiments, loyalties, and expectations.

ADVANTAGES OF MASS COMMUNICATIONS

Mass communications have many advantages:

The **instant** a persuasive message is constructed it can be transmitted great distances and received by a large number of people, individuals, and groups.

Mass communications can be **intensely emotional and unrelenting** to dramatize and lend credibility to needs and the desirable behavior to satisfy them.

Despite the selectivity of a mass communication target, numerous nonselected people are subjected **indiscriminately** to the message transmission.

The mass communication, due to its purpose of reaching wide ranges of audiences, is constructed to be perceived by the common denominator. Thus, a persuasive message may be constructed for transmission to the middle class with the calculated objective of gaining the attention of the lower upper class and the upper lower class.

People band together in a society to satisfy self-preservation and self-maintenance needs. Through mass communications, attention can be focused on these **broad societal needs** to change the attitudes of mass audiences as opposed to the limited individual face-to-face approach.

The psychological operator **must not assume** that audience needs are limited. Few societies exist whose needs are not expanded through exposure to mass communications.

INTERPERSONAL COMMUNICATION

Interpersonal, or face-to-face, communication is person-to-person contact within the range of

activities by which people communicate orally in direct face-to-face situations; e.g., rallies, groups, group associations, and social activities. It enables the psychological operator to select the target, rapidly disseminate the appeal, and immediately assess its effectiveness.

ELEMENTS OF FACE-TO-FACE COMMUNICATION

To be effective, the communicator must know specifically what he desires to say, how it should be said, to whom, and where and when to say it.

The Message. The communicator must be certain of the message he wishes to convey. In most situations themes for face-to-face communication seek to generate cohesive behavior. The themes or line of persuasion should be preplanned and questions anticipated.

Presentation. The manner of presentation is of utmost importance. The presentation must be in terms and language which the target audience understands and can relate to its own experiences. It is essential that the communicator know the audience, be fluent in their language, and be able to identify with them.

Audience Selection. Key personnel who influence the opinions of a wider audience are the more useful in spreading the message.

Time and Location. The time and place a message is delivered must be convenient for the target audience. The psychological operator is trying to sell the target audience; therefore, the audience's convenience has a higher priority than the communicator's.

METHODS OF EMPLOYMENT

Controlled face-to-face communication is best used when military forces are in direct contact with the target audience. In most cases, the face-to-face communications network already exists. In some circumstances, the communicator may or must create a situation conducive to face-to-face communication.

Rallies. People gathered to be informed and entertained are susceptible to persuasion and may be stimulated to support a cause. They are usually drawn to rallies by a common interest and a feeling of participation or belonging. Under such conditions, propaganda messages may be accepted by many people of different social and economic levels. Skilled use of rallies and meetings can involve the audience emotionally.

Groups. Small, tightly organized groups are highly effective in spreading appeals. By organizing such groups or exploiting existing ones, the communicator can extend his appeal to larger groups.

Group Associations. Associations, such as youth groups, religious organizations, women's clubs, etc., provide opportunities to expand the impact of the message.

Social Activities. Social activities appropriate to local customs and patterns can stimulate cohesiveness. Such gatherings may serve a propaganda purpose, as well as offering opportunity for social communication.

Person-to-Person Contact. There is no substitute for the intimacy of individual contact. A person is more likely to believe and accept what he hears in the course of a conversation than what he reads or otherwise learns. The propagandist can tailor his appeal to fit the individual's experiences and needs. This tailoring is more likely to achieve results than a mass appeal dependent on an approach targeted at the average intelligence level of the target audience.

Other media reinforce face-to-face communications. The leaflet, pamphlet, or magazine handed to a participant in a mass rally, the poster reminding all of a positive action program, the motion picture or television program to illustrate the speaker's purpose, the printed material given to the individual after an ideological discussion contribute toward the success of the PSYOP program.

TECHNIQUES

Some Tips to Remember

Make each meeting contribute to the entire PSYOP program.

Choose areas free from interruptions and distractions.

Set a time limit. Allow enough time for the meeting.

Choose topics important to the target.

Ask questions. Questions give the audience a chance to actively participate. The audience merely listens to statements. Questions encourage them to listen and speak. They cause action.

Understand responses. Be certain you understand any comment or answer. Repeat, in your own words, what you thought the other person said. If he agrees, you understood him. Do not discuss the point unless it is clear to you.

Be explicit. Explain precisely and make clear to the target audience the problem, the point of discussion, and the required action.

Use concrete words. Avoid words that the audience can or is likely to misinterpret.

Stress all points on which you agree with the target audience.

Avoid minor disagreements. If you disagree on important points, do so politely. Do not antagonize or make the audience sympathetic to the other side. The following techniques will help:

Politely point out that the other side is wrong about some important points. List them.

or

Politely point out that the other side is uninformed. Then make the point: If they had the information, they would change their opinion and agree with you. Give the correct information.

or

Prove the other side is reasoning illogically; and give the right idea.

or

State the other side's reasoning may be partially right but that it does not consider some factors. Then give the facts to support the point you want to make.

Know the subject thoroughly. If you cannot answer a question, **do not lie** no matter how minor or major the issue. Lying destroys credibility.

Make no promises you cannot or do not intend to keep.

Be confident. Control your emotions. Do not give way to emotions that will antagonize the audience.

Reinforce your point. Select evidence that supports your position. In order to avoid charges of bias, you may introduce minor points to support the opposing view.

Encourage the audience to think along lines that lead to the conclusions you want.

Present conclusions to the audience. Sometimes you may have to disguise them. The type of audience determines the extent to which you must do so. Emphasize conclusions on subjects that are unpopular with the target audience.

For the unfriendly or suspicious audience, disguise or present the conclusions as questions, making the desired answer or action appear to the audience to be the logical one. You must present clear, concise, and coherent conclusions to a less educated or apathetic audience. You will insult a well-educated audience by openly presenting conclusions to them. Use carefully phrased questions, making the response you want the only logical one.

Arouse the audience's emotions, but keep them under tight control. Attention-getters may make your appeals more attractive. The attraction must, however, be moderate to reinforce your message and not divert attention. Examples are attractive or popular persons--men or women, depending, among other things, on the culture--presenting a message, the political picnic, entertainment troupes at rallies, and background music.

Have the audience participate. The most effective appeal is that which requires audience participation, if participation verifies the message. For example, if you, the propagandist, tell an audience that a nearby area has been completely destroyed by our firepower, and this is verified by members of the audience, your future credibility will be enhanced.

Generate discussion. A frequent way to get audience participation is to generate discussion, either through questions to the audience or questions or comments from people planted in the audience. Once the discussion begins, the

psychological operator knows that he has awakened an interest, which is encouraged. The psychological operator is successful when the audience is moved from discussion to action.

Present new material or change style. An audience may become bored or resent hearing the same appeals or arguments. The chance of success for an appeal may be increased by presenting new material or by changing the style of presentation.

Rumor

Rumor can be spread by any medium. It can best be controlled or eliminated in face-to-face situations. Rumor thrives when general knowledge of the facts is limited and the conditions or situation which are the subject of the rumor may be subject to ambiguous interpretations. Rumor feeds on the hopes, fears, and desires of a population.

MASS AND FACE-TO-FACE COMMUNICATIONS

The psychological operator must view mass communications as a supplement to interpersonal communications, but he must understand they are **not a substitute** for a lack of knowledge of the culture and society. This dictates:

The absence of equipment must not be used as an excuse not to communicate.

The use of equipment to transmit a persuasive message must be proven necessary.

He must also understand that overdependence on equipment can result in the failure of a message. Success, on the other hand, can be assured if alternate face-to-face (interpersonal) communications are available as contingencies; i.e., rallies, meetings, show-and-tell demonstrations, rumor campaigns, social gatherings, etc.

While mass communications offer the most rapid means to reach the greatest number, the personal touch of face-to-face communications is the most effective way to "clinch the argument" and sell the product. It can be said, "There is a direct correlation between mass communications and face-to-face: The closer mass communications approximate face-to-face, the more effective they become." This is the major reason why famous, noted, popular, widely liked, admired, respected, or loved persons and personalities are widely used in mass communications selling campaigns--particularly in selling ideas.

COMMUNICATIONS BARRIERS AND THE PSYCHOLOGICAL OPERATOR

Barriers

Barriers to effective communications develop due to differences in the meaning of the words, symbols, and actions transmitted among individuals and groups within a culture (intracultural) and between individuals and groups of different cultures (intercultural).

One of the most critical aspects of working cross-culturally is **recognition of differences in cultural values and assumptions**. There are certain experiences

shared by most individuals within a society, so common reactions to an event can be anticipated. These values and assumptions are so much a part of the individual that the target audience will be unaware of how much their behavior is influenced by them.

Words, symbols, and actions being created within a cultural context create communications problems between people from different cultural backgrounds. They do not know the meanings attached to each other's words, symbols, and actions. The cultural influences act as constraints upon cross-cultural communication and can be analyzed as differences in cultural values and assumptions, objectives, and behavior patterns.

Psychological Operator

The psychological operator has learned to work for certain culturally-oriented life goals. His goals may vary significantly with the life goals of those persons selected as a target audience. For example, the objectives of one culture may be oriented toward achievement of harmony with the environment, while another may be oriented toward changing the environment. Such differences are obstacles to understanding and, therefore, to effective PSYOP.

The psychological operator provides the means to interpret only the behavior within his culture. He expresses this interpretation through words, symbols, and actions which, if transmitted by message, may not be acceptable in another culture. A clenched fist, for example, may be a gesture of anger in one culture and a salute in another. Innocuous words in some countries become foul vulgarities in others. In some societies, asking about the well-being of the female members of a friend's family is proper and desirable; in others, it is a serious breach of etiquette.

A possibility of being **culturally biased** must be recognized and every effort made to interpret behavior in terms of the target audience's culture.

In developing messages which will be meaningful to the target audience, the psychological operator must take into account both his and the target audience's cultural backgrounds. He must acquaint himself with the established customs and social taboos of his target audience to prevent inadvertent disparaging remarks or actions. Phrases, comments, expressions, and actions that are normal in our society may be offensive in other cultures.

A problem that deserves special attention is communications with the nonliterate or semiliterate audience. Collectively, this audience represents great potential power, constituting 60 to 80 percent of the population of some countries. The psychological operator must not assume that people identified in other cultures as literate meet his standards. A large number of people who are considered literate in their culture possess such a limited reading ability that they should be classified as semiliterate. In view of their numbers and low status, nonliterate and semiliterate groups are fertile for support of ideas and actions (insurgencies, civil war, revolutions) which promise to alleviate their suffering.

Knowing what this audience considers valid evidence and how they can be convinced is particularly necessary. And identifying individuals they accept as leaders or status people is extremely important. These leaders or status people, who can get the populace to accept an idea, should be the first target of the PSYOP

communication. However, consideration must be given to their traditional methods of decisionmaking. In many cultures, the leader may have no control over the final decision. He can only vocalize the decision reached by the group as a whole.

The psychological operator must recognize that the target has its own language to transmit cultural meaning. It may, therefore, be advisable or necessary to use members of the target audience to assist him in various ways; i.e., as propagandists, translators, advisors, etc. He may also use them, by means of discussions and social activities, to gain an intimate knowledge of their language, values, culture, goals, folkways, mores, customs, and laws. He must realize that for communications purposes the target audience is distinct from other individuals and groups, due to varying demographic, cultural, individual, and sociological characteristics.

Demographic characteristics provide statistics such as age and sex distributions, birth and death rates, race, religion, occupation, income, language, social class, and political affiliations of members of the target audience.

Cultural characteristics consist of all behavior that is learned, shared, and transmitted by words, symbols, and actions. To communicate effectively with the target audience, the psychological operations personnel must have a command of such target audience characteristics as language, customs and traditions, norms, values, ethics, mores, folkways, attitudes, opinions, the social system, the religious system, the political system, the kinship system, the education system, and the economic system.

Individual characteristics that may be available to the psychological operator for analysis and employment are individual and group stimuli, sensation, motives, needs, drives, perception, and frustration.

Sociological characteristics deal with those aspects of the group which can enhance or inhibit communication. These include, but are not limited to, demographic, cultural, and individual characteristics mentioned above.

It is through the group and group processes that attitudes and behaviors may be changed. Therefore, by using a group approach, a successful persuasive message that will be accepted by group members can be rapidly disseminated. Such acceptance will be greatly enhanced if the key communicators within the group are convinced of the importance of the message and convince others within the group.

The psychological operator must give continued attention to message feedback to determine the meanings given to his message by the target audience.

Translations and the Translator

The ideas to be included in a persuasive message must be thoroughly discussed with the translator. The translator must be given ideas and allowed to translate them into the language of the target audience.

By avoiding word-for-word substitutions, in translations, meaningful ideas are presented in the logical order of the target audience's language, as opposed to the fragmented meaning that word-for-word translations can create.

This approach allows the translator to use language that holds the most meaning for the target audience. It also makes easier the construction of persuasive messages in language that arouses the emotions of the audience.

*Chapter Eleven***PROPAGANDA AND
COUNTERPROPAGANDA**

Propaganda is the sales pitch. It's a message with a point of view. It is the deliberate spreading, by any means of communication, of doctrine, ideas, facts, argument, information, allegations, or appeals to advance a friendly cause or injure an enemy cause. This may be done by words, symbols, public action, or other deeds. For a formal definition, see appendix H.

PROPAGANDA

The purpose of propaganda is to bring about behavior that the propagandist desires and to reinforce that behavior with favorable opinions and attitudes. In order to accomplish its purpose, propaganda must fit within the cultural context of the audience. It should also avoid direct attacks on the core beliefs and traditions of the target audience.

EFFECTIVE PROPAGANDA--CRITERIA

The tests for effective propaganda are simple:

Does the propaganda fit within the cultural context of the audience?

Has the propaganda avoided direct attacks on the core beliefs and traditions of the target audience?

To what extent did it influence the target audience to follow the course of action desired by the propagandist?

To what degree did it help the tactical commander? How? Why?

How successful was it in helping to defeat an insurgency and gaining the willing active support of the population? The armed forces?

To what extent did it succeed in enabling the United States to achieve its national policy objectives?

CLASSIFICATION

Propaganda is classed on the basis of source:

White: Its source is openly stated.

Gray: No source is given.

Black: Attributed to other than the true source. This type is normally used to support strategic objectives. It generally emanates from the highest levels of command or government and is disseminated by designated specialists.

White, gray, and black do not refer to the content of the propaganda message. **The terms merely refer to the methods used to carry out the operation.** See "white propaganda," "gray propaganda," and "black propaganda," JCS Pub 1.

BASIS FOR DEVELOPMENT

The following elements are basic to the development of propaganda:

Psychological Operations Objectives

One of the basic factors that determines what is said, how it is said, and to whom it is said is the psychological objective that the psychological operator wishes to achieve. The psychological objective is a statement of a measurable response expected of the target audience as the result of PSYOP.

Target Analysis

Target analysis seeks to identify, locate, and gain psychologically relevant insights about target audiences by a detailed analysis of intelligence. A detailed analysis of target analysis is found in chapter 14.

Target Audience Interests

In order for propaganda to appeal to an audience, it must be pertinent to the interests of that audience. It must satisfactorily answer the questions, "What do you want me to do?" "What's in it for me?"

Detailed Current Intelligence

Detailed current intelligence is needed for successful propaganda. For a discussion on the use of intelligence in PSYOP, see chapter 14.

Production

An important question facing the propagandist is the availability of media facilities; for example:

Are press, inks, paper, and other printing supplies available?

Are radio and television production facilities available?

Can audiovisual material be locally processed?

Dissemination

Not only must propaganda be produced, it must also be disseminated. The psychological operator must determine whether he has the means available to effectively disseminate propaganda. For example, is radio and television transmitting equipment available?

Credibility and Impact of Media

In planning propaganda campaigns, themes, and messages, the psychological operator must know the credibility attached to each medium by its target audience and the impact of that medium. He must also know media patronage profiles. Credibility and patronage vary with the target audience and the media used to spread the message. The psychological operator must also know the type of audience each medium attracts and its characteristics.

Suitable Language

Frequently the audience may take great risks to hear or read a message, and must do so quickly. The message must be worded to permit them to do so.

Priority of Interests

Not only will the language vary, but priority of interests must be considered. For example, the priority of interests of peasants are not the same as those of city merchants; nor are those of city merchants the same as those of university students; and none of these are the same as those of a soldier under artillery bombardment.

Pretesting

All propaganda must be pretested before it can be disseminated. Pretesting gives the psychological operator a good idea of the potential credibility and effectiveness of his message. The selection and use of a particular pretest method must be based primarily on the accessibility of the target audience to PSYOP personnel.

Survey sampling is the most reliable method of pretesting propaganda. This method requires personal solicitation of the members of the target audience. In this way, empirical data is obtained from the intended recipients of propaganda. The two major methods of obtaining specific information by survey sampling are the use of questionnaires and personal interviews. The primary purpose of using an interview is to present items of interest personally to the respondent, thereby precluding errors in interpretation, and to obtain replies from other individuals so that generalizations can be made.

Most personal interviews follow a prescribed pattern; both the wording and order of questions are decided upon in advance and rigidly adhered to. A less formal type of interview uses a detailed list of subject matter to be covered. It permits the interviewer to vary the wording and order of subject matter so that the maximum amount of information concerning specific topics can be obtained.

Survey sampling requires personnel trained to collect data, personnel skilled in its interpretation, and accessibility to the target audience.

When the target audience is not reasonably accessible, panels of representatives of the target audience may be used. These may include prisoners of war, refugees, defectors, and other available typical representatives of the potential target audience. Panels must be as closely representative of the target audience as possible. Pretests with such groups can indicate what appeals are likely to be effective, what to emphasize, and what to avoid. By being familiar with the backgrounds of panel members, the results of pretests can be interpreted in the light of differences between respondents and the intended target audience.

Panels of representatives may be configured in a number of ways. A panel may consist of as few as five representatives or as many as a hundred. The guiding consideration is that the number of representatives must be sufficient to provide an adequate cross-section of the intended target audience, and the number of responses must be sufficient to provide a reliable indication of effectiveness.

Pretesting may be done by using the following methods:

Group consultation. This method allows representatives (5 to 15) to observe and study an item of propaganda and exchange views among themselves. It requires the pretester to direct the discussion along prearranged lines to obtain information and preclude extraneous comments. Use of this procedure enables the respondents to exchange ideas; sets the respondents at ease, since they are among peers; and enables the pretester to utilize large numbers of representatives in a relatively short time. The disadvantages are that the respondents may tend to agree with the majority to avoid peer-group criticism. In addition, discussions may become long and extraneous unless carefully controlled. Care must be exercised to assure that comments which are relevant in the sociocultural setting of the respondents are not excluded by overcontrol.

Individual interview. This method allows respondents to observe and study a series of preranked, prearranged items of propaganda. By use of this method, several items of propaganda previously used on actual target audiences are given a decreasing effectiveness rating ranging from very effective, through moderately effective, to not effective. The new item is matched with the prescaled propaganda. The respondents are asked to indicate which items of propaganda material they feel are most effective and why. Choices are compared. If a majority indicate that the new item of propaganda is likely to be more effective on the actual target audience than the prescaled items of propaganda rated "not effective" or "moderately effective," the new item of propaganda may be used.

On the other hand, if a majority of the panel indicate that the new item is not likely to be as effective as the prescaled propaganda rated "not effective" or "moderately effective," the new propaganda material should be revised to conform with panel recommendations. The pretester must determine why each respondent makes his choice.

When using panels of representatives, it is essential that the individual conducting the pretesting give very explicit instructions. Some of the more important points to cover and actions to perform include:

Pretest instructions and actions:

Explain reasons for and the nature of the pretest.

Put the respondent at ease.

Inform the respondent that his identity will remain anonymous, if he desires.

Inform the respondent that his cooperation with the pretest will not affect his status.

Inform the respondent that he should consider himself to be in the status and position of the target audience he represents.

Convince the respondent to answer according to his convictions--that the purpose of the pretest is to identify weak as well as strong points--and explain the reasons.

After the pretest:

Express appreciation for cooperation.

Reaffirm that the respondent understands that he will receive no reward, financial or otherwise, for participating in the pretest.

Reaffirm that the respondent understands that his identity will remain anonymous.

When the target audience, or representative personnel, are not available, panels of experts can be used to pretest propaganda. These individuals, who need not be representative of the target audience, should possess current knowledge and be expert in pertinent areas of knowledge or learning; i.e., order of battle, sociology, politics, communications, etc.

Experts may be located near any PSYOP unit. They may be found in the United States Information Service, United States Agency for International Development, intelligence agencies, business firms, etc. These individuals should be used whenever the need for them arises.

Posttesting

This difficult but essential step in development of propaganda determines the next or new propaganda message. The questions that posttesting must answer are:

What did the propaganda achieve?

Was it effective?

How effective?

Why not totally effective?

What propaganda will achieve total effectiveness?

It is extremely difficult for the psychological operator to measure changes in conduct and intangibles, such as attitudes, opinions, and emotions, upon a physically inaccessible audience. The effects of propaganda upon such an audience may be gleaned from the reaction of the enemy government as determined by its actions and made known by various media. Prisoners of war, defectors, line crossers, and sometimes, press correspondents may assist in the process.

Evaluation of all factors influencing propaganda and the results must be objective. All propaganda must be evaluated on the basis of the results desired and the results achieved, but must be measurable by comparing the results desired with the actual change in conduct, attitudes, opinions, and emotions.

BASIC CHARACTERISTICS OF US ARMY PROPAGANDA

Success in PSYOP is impossible without credibility. Even in the most underdeveloped areas, or under the most adverse conditions, the truth becomes known to a target audience. If lies have been told, credibility is lost. Once lost, it can never be totally regained.

US Army propaganda is based on a strategy of truth. It seeks to strengthen or create a favorable image by emphasizing the credible truth. This is so because the complete truth is frequently not believable (is incredible) to the target audience. For example, in World War II it was incredible to the enemy that the prisoners of war we had captured were receiving regular rations of cigarettes (with tobacco in them), fresh oranges, chocolate bars, coffee, and other items not available to the general populace in enemy countries.

Dedication to the truth does not imply that a full recounting of facts is required or advisable. Facts to support certain themes may be selected while others may be excluded. The propagandist reports those facts that present his side in the best light. However, to maintain objectivity, he may present some views (generally minor) from the other side. This is done, in many cases, to reduce the impact of enemy propaganda and to increase the credibility of US/friendly propaganda, since people tend to believe a source if both sides of a position are presented, even when one side is dominant.

KEYS TO SUCCESSFUL PROPAGANDA

The first requirement for successful propaganda is a national policy that meets the needs of the target audience. The role of the psychological operator is to communicate that policy. Not only must the propaganda be credible and persuasive, it must also not be recognizable by the target audience as being propaganda:

News--commentary--discussion--instructions--facts--entertainment
--YES! Propaganda--NO!

Propaganda must be **based on reality**. Any gap between reality and propaganda will be quickly noticed. It does not require mass communications systems to reveal discrepancies. The jungle drum and the bamboo telegraph will do that quickly enough. With the transistor radio and even television reaching the most primitive areas, the time gap is even shorter.

Messages to different groups of people will vary according to their different interests, but the underlying themes--the substance of the messages--must be **consistent**.

Messages to different audiences may be different, but **never contradictory**. **The credible truth must be consistent to all audiences.**

Propaganda must gain attention--**IMMEDIATELY** open minds. It must be presented so that the target audience will open its mind (individually and collectively) to receive the message. Insults, harassment, and messages degrading the target audience have the unwanted effect of closing the mind.

After the mind is receptive to the message, **it must be held open**. This is done by appealing to the interests of the audience and by presenting better solutions to their problems than those presently available. If possible, the propagandist must create or awaken an awareness in the target audience to needs that only he, the propagandist, can satisfy.

The psychological operator must take into consideration the fact that not only does each target audience have its own specific interests, but these interests have a priority of importance. Propaganda will hold the attention of its target audience only so long as it appeals to the most urgent interests and needs of the audience, and so long as the solutions offered are realistic and safe.

The same factors that apply to overcoming resistance to propaganda also apply to **gaining and holding an audience**. With good propaganda, however, it is easier to gain and hold the attention of a new audience than one that has turned away from previously disseminated material.

The degree to which actions are influenced and the permanency of actions (when free from coercion) measure the success of the message. The most successful propaganda, with the longest effect, is that which **reinforces the actions** brought about by creating favorable opinions, emotions, and attitudes in the target audience. The favorable opinions, emotions, and attitudes give **permanency to the actions**.

ROLE OF THE ENEMY

The psychological operator must always bear in mind that the enemy government, with its civilian and military agencies, has a major effect upon the target audience. This effect places the US/friendly propagandist at a disadvantage which he must overcome. The following factors are of primary importance.

Enemy Control Over Audience

An enemy government generally has physical control over the target audience. This gives it the power and ability to punish those whom it considers to be criminals or nonconformists. Fear of punishment is a major deterrent to actions that the propagandist might desire; e.g., having a target audience listen to his radio broadcasts when listening is punishable by death.

It follows that a government that has physical control over a designated target audience also controls the total welfare of that audience. Aside from incarceration and the power to inflict death, the enemy government has lesser but, nonetheless, highly effective means of interfering with the propagandist trying to reach those within its jurisdiction.

The government might prohibit criminals and nonconformists from working. It can restrict travel, a serious penalty for those who must travel to work but who may be prohibited from doing so by government edict.

Those within the power of an enemy government are aware that their welfare depends upon compliance with the wishes of their government. They will hesitate to jeopardize their well-being and that of their families.

Enemy Interference With Friendly Propaganda

Propaganda does not flow freely into enemy territory. The enemy has the physical power and means to restrict the flow of communications within any territory it controls, even where there is an effective shadow government.

Enemy-Imposed Sanctions and Rewards to Informers

Not only can and will the enemy government impose sanctions upon those who defy its wishes, laws, and edicts, but it will also offer substantial rewards to those who inform on lawbreakers and nonconformists. These rewards may take any number of forms: money, jobs, rank, land, business opportunities, power, fame, etc.

Generally, the fear of being reported is as great as being caught transgressing by police or other security agents. This fear often inhibits individuals, groups, or even societies from freewill actions, such as listening to foreign radio broadcasts and speaking with strangers, nonconformists, or members of outgroups.

Enemy Popular Support

While it may be your enemy, a government or armed force is someone else's friend. The psychological operator who works on the premise that his enemy is everyone's enemy is deceiving himself. Every government has some degree of popular support. It has those who will take the necessary steps to support it. For example, the bureaucracy of government employees has a vested interest in aiding the government that employs it. There are also a great number of people who would fear change, and there are always those who believe in their government, right or wrong. None of these will assist the propagandist. In fact, they probably will actively oppose his efforts.

Enemy Propaganda Campaign

The last, but not least, effective weapon of the enemy will be its own offensive propaganda. This propaganda will strengthen the resolve of those who favor the cause of the enemy and will tend to weaken the resolve of those who are neutral. The enemy's propaganda may require the US/friendly psychological operator to divert time, energy, money, personnel, facilities, and other resources to counter it.

The psychological operator must not downgrade enemy PSYOP efforts; he must be aware that he does not have a monopoly on effective psychological operations and credible persuasive propaganda. **Never underrate your enemy** is as true for psychological operations as it is for combat.

The way to success is not a one-way street. The psychological operator must expect that his successful propaganda efforts will bring about an **enemy counterpropaganda campaign**. The results of the counterpropaganda campaign will depend on the effectiveness of US/friendly efforts. An enemy's irrational overreaction may work to the advantage of the US/friendly propagandist.

While US and friendly military, economic, and political sanctions will lessen the will of some members of the enemy forces to fight or the will of civilians to support their government, these same sanctions may strengthen the will of others to resist our efforts. Our propaganda may incite some members of a selected target audience to greater antagonistic effort.

Authoritarian governments are prone to overact; this may work to the benefit of the US/friendly propagandist. Overaction by blanket prohibition will generally help the US psychological operator. It will lead people who are naturally curious to take risks to satisfy their curiosity.

Prohibition from listening to US/friendly radio broadcasts or watching TV may, in spite of the risks, whet the desire to hear and see what we may have to say or show. Prohibition from reading leaflets, circulars, newspapers, and magazines may lead to a black market in these items.

The propagandist must make the target audience's risks worthwhile by disseminating propaganda that appeals to their needs and interests and helps them alleviate their situation.

If US actions are honorable and humane and its accompanying propaganda credible, acceptance by a few may lead to a bandwagon effect, and hostility may decrease. The effects of a sound, complete message (actions and words) can be contagious.

Resistance to Propaganda

The first step to overcoming resistance to propaganda is to determine the reasons why it is resisted. This may require thorough background research into the history of the target audience whose values, culture, and present conduct have a historical basis. All groups, cultures, and societies have events in their history that are particularly significant and are categorized by key slogans, phrases, events (e.g., Bastille Day in France), and religious ceremonies.

A basic ingredient in overcoming resistance to propaganda is a logical PSYOP plan that is **culturally accurate**. The most detailed PSYOP plan in the world is utterly useless if it is not appropriate to the environment, conditions, and culture of the target. Each target group is susceptible to specific appeals. A plan that considers the uniqueness of its target will, when implemented, more readily overcome resistance by the target audience.

While words may make promises, actions concretely prove intentions. A major role of the psychological operator is to communicate word of the **implementing efforts**.

Everybody likes a winner. This works to the advantage of every psychological operator. Success and victory have a bandwagon effect in that they bring more adherents to the cause. The greater the success or victory, the greater and more assertive the PSYOP campaign should be to **exploit the success or victory**. The uncertain and wavering will join the victorious cause. The ties of the strongest adherents to the losing side will weaken. Good PSYOP enhance the effects of victory and success.

PROPAGANDA LIMITATIONS

The following factors place limitations upon the effectiveness of PSYOP and propaganda:

Political

Political situations and conditions may be such that the aspirations of the target audience cannot be fulfilled. National policy may preclude offering even token fulfillment. Complete agreement among allies is seldom attained on policy affecting their goals, national interests, and courses of action. Conflicting needs of other agencies of government operating abroad and military necessity may make policy uncertain. This may result in courses of action that reduce credibility and good will below the level desired in psychological operations.

Military

The military situation may be adverse, thereby stringently limiting the use of effective propaganda. Even static military situations restrict the possible effectiveness of PSYOP. Military security may limit the use or timing of potentially sound and effective themes and messages.

Audience

Target audiences are suspicious. Under the adverse conditions in which they generally exist, they have every reason to be. Being suspicious, they are not disposed to believe that the propagandist really has their interests at heart, or even that his interests are compatible with theirs. Because of historical, social, cultural, and language differences, the target audiences may not respond to the propagandist's line of reasoning. Because the enemy regime has greater access to the people under its control, it can interpose barriers that will limit or destroy any chance of communication between the propagandist and his intended target audience. In addition to technical communications barriers, extensive political and security police organizations that control communications can impose sanctions on the intended audience.

Personnel

Ultimate success depends upon dedicated, proficient personnel who can do the job. Unfortunately, due to scarcity and great demand, they are frequently not available in time of conflict. Equipment is not a substitute for these people.

COUNTERPROPAGANDA

Counterpropaganda is propaganda directed at the target audiences of enemy propaganda; it is designed to counteract enemy or other foreign propaganda and to capitalize on vulnerabilities in their campaign. Through the use of counterpropaganda, enemy campaigns can be either neutralized or minimized. While counterpropaganda is basically defensive to limit the effectiveness of enemy propaganda, it is not so in a negative sense. Using imagination, a psychological operator can, and should, initiate a well-planned, aggressive, and effective counterpropaganda offensive.

USE OF COUNTERPROPAGANDA

The use of counterpropaganda must be based on intelligence, propaganda analysis, and the answers to the following questions:

How will the counterpropaganda affect the overall PSYOP campaign?

What is the current and potential impact of enemy propaganda?

What is the probability of success of counterpropaganda?

The psychological operator must be aware of the danger of becoming so involved in a counterpropaganda campaign that he loses the initiative.

COUNTERPROPAGANDA TECHNIQUES

The technique used will depend upon the current situation and the possibility of success. Some of the most common techniques are:

Conditioning

This involves the use of education and information programs to condition the target audience and thereby reduce the shock effect of anticipated enemy propaganda. This technique reduces susceptibility.

Forestalling

This technique is akin to "immunization." It is the process of counteracting or capitalizing on a subject potentially exploitable by enemy propaganda before the enemy uses it.

Minimizing the Subject

A subject may be minimized by the following techniques:

- Emphasize its favorable aspects to the target audience.

- Insinuate the entire story cannot be told at present, while suggesting that the full facts will prove the enemy story either inaccurate or totally false.

- Briefly mention the enemy story and drop it.

Direct Refutation

This is a point-by-point rebuttal of enemy propaganda. A danger of direct refutation is that it may, by keeping the subject in the "public eye," add strength and possibly credibility to enemy propaganda. Therefore, care must be taken to counter the enemy's story so completely and effectively that publicity will not give it credibility.

Indirect Refutation

Indirect refutation introduces new, relevant themes which refute the enemy propaganda by implication and insinuation. By using this technique, the psychological operator is less likely to reinforce the credibility of enemy propaganda than if he directly refuted it.

Diversionsary Propaganda

This is an attempt to divert the attention of the target audience from the enemy propaganda by using new themes or by intensified use of themes that have proven effective.

Imitative Deception

This technique involves the alteration of enemy propaganda so as to give it a different slant, a slant favorable to the United States and its allies.

Silence

The best technique may be to ignore the enemy propaganda, particularly when active counterpropaganda measures may be dangerous or the effect is uncertain. In the event that the enemy theme does not lend itself to successful exploitation, or the subject is not important enough to warrant rebuttal, IGNORE IT--REMAIN SILENT! Before using this technique, the effect of silence upon the public must be weighed.

Restrictive Measures

Restrictive measures may be used to deny the target audience access to enemy propaganda. This, however, calls attention to the enemy output and whets the desire to learn the enemy's story. It thereby encourages the target audience to listen to and read the denied propaganda covertly. Restrictive measures, generally used by authoritarian governments, are never completely effective. Total enforced isolation is virtually impossible. Restrictive measures are not recommended.

Chapter Twelve

PSYOP PLANNING

12

The key to the success of PSYOP, as with any military operation, is adequate planning. The need for detailed, long-range imaginative planning is critical.

To be successful a psychological operation requires:

- A complete, detailed, accurate data base arranged for ease of use.
- Detailed, timely intelligence.
- Centralized control.
- Sound and timely planning.
- Decentralized execution.
- Optimum use of available resources.

Psychological Objectives	12-7
Themes	12-7
The Message	12-8
Message Structure	12-8

Psychological operations planning is a continuous process requiring imagination and determination. It must be responsive to immediate change brought about by any new condition or circumstance affecting the target audience or the psychological objective. The resulting plan is also subject to change.

The **PSYOP planning process must be flexible**. Targets of opportunity should be exploited as they arise. Opportunities to exploit a vulnerability may be lost by inflexible insistence on implementing the original plan. Vulnerabilities, conditions, target audiences, objectives, and themes often change rapidly due to shifts in events and policies.

Planning may precede or follow the decision to carry out a course of action. Whether the planning precedes or follows the decision, the ingredients are essentially the same for any PSYOP plan. For example, contingency plans follow the same pattern; they cover a variety of situations, such as the end of hostilities, intervention by other nations, the use of new weapons, changes in political conditions, and changes in the military situation. Contingency plans are designed to be implemented immediately upon order when the anticipated and prepared for event occurs.

PLANNING CONSIDERATIONS

Realistic objectives that can be achieved within policy limitation.

Analysis of the existing military and political situation.

Sources of information.

Delineation of the target and its accessibility.

Themes to be used to achieve PSYOP objectives.

Themes to be avoided.

Media to be employed.

Formal staffing and coordination required to effect the plan.

PSYOP PLANNING SEQUENCE

The sequence of steps taken to plan a psychological operation will vary with the situation; however, the same steps apply to any PSYOP planning. The flow and sequence of major PSYOP actions which occur in both PSYOP units and staff sections are shown in figure 12-1 to guide those involved in planning and supervising psychological operations.

As a first step, PSYOP personnel constantly gather information relevant to the area of operations. This intelligence focuses on subjects of PSYOP interest. The material, gathered from numerous sources and analyzed, is placed in a Basic PSYOP Study (BPS). (For a detailed discussion, see chapter 14 and appendix C.)

Target analysis is a major action in campaign development. It is an examination of intelligence to permit the analyst to establish a list of psychological objectives to guide PSYOP personnel in conducting psychological operations. (For a detailed discussion of target analysis, see chapter 14 and appendix F.)

Mission Assignment

A PSYOP support mission can be given to a PSYOP unit at any time during the PSYOP planning sequence prior to the initiation of campaign control. Upon receipt of a PSYOP mission, the PSYOP personnel follow the routine decisionmaking steps outlined in FM 101-5.

PSYOP Estimate of the Situation

The ACofS, G5 is responsible for the preparation of the PSYOP estimate of the situation (appendix D). The commander's decision regarding PSYOP support of the mission is made from this document. The estimate should, above all else, make clear the psychological impact of the commander's proposed courses of action.

Plan Preparation

After the commander announces his decision, the ACoS, G5/S5 prepares plans/annexes tasking the major subordinate elements with the responsibility to accomplish the PSYOP tasks. The same plans provide the commander with sufficient PSYOP support to accomplish the tasks. The PSYOP unit commander makes recommendations for the employment of the PSYOP assets.

Media Selection

Selection of media to transmit messages is based on the information revealed during target analysis. The analysis determines the type of media that is acceptable and credible to the target audience. (See chapter 17 for further discussion.) The planner must also consider the availability and mechanical capability of the media to deliver the message. For example, if television is selected, the audience must have access to compatible receivers. Early in the planning stage, consideration must be given to the time required for production and delivery. The message must be delivered at the needed time.

Propaganda Development

Propaganda development is the process of taking information, knowledge, and material available, visualizing it all, and expressing it as artwork, words, symbols, texts, manuscripts, and actions.

Pretesting

A pretest to determine the probable impact of PSYOP material upon the target audience and unintended audience should be accomplished using the appropriate techniques. The best sounding board for pretesting is a cross section of the target audience. If these people are not available, a panel of those most similar to the target audience should be used. (See chapter 11 for techniques.)

Campaign Control

Campaign control involves the production and dissemination of PSYOP material. For a discussion of campaign control see appendix G.

Posttesting

Posttesting and pretesting techniques are the same, but the same personnel must not be used on both testing procedures. In addition, posttesting discussions must be concerned with the reasons for audience responses.

Feedback

This is the basis for modification of plans and operations.

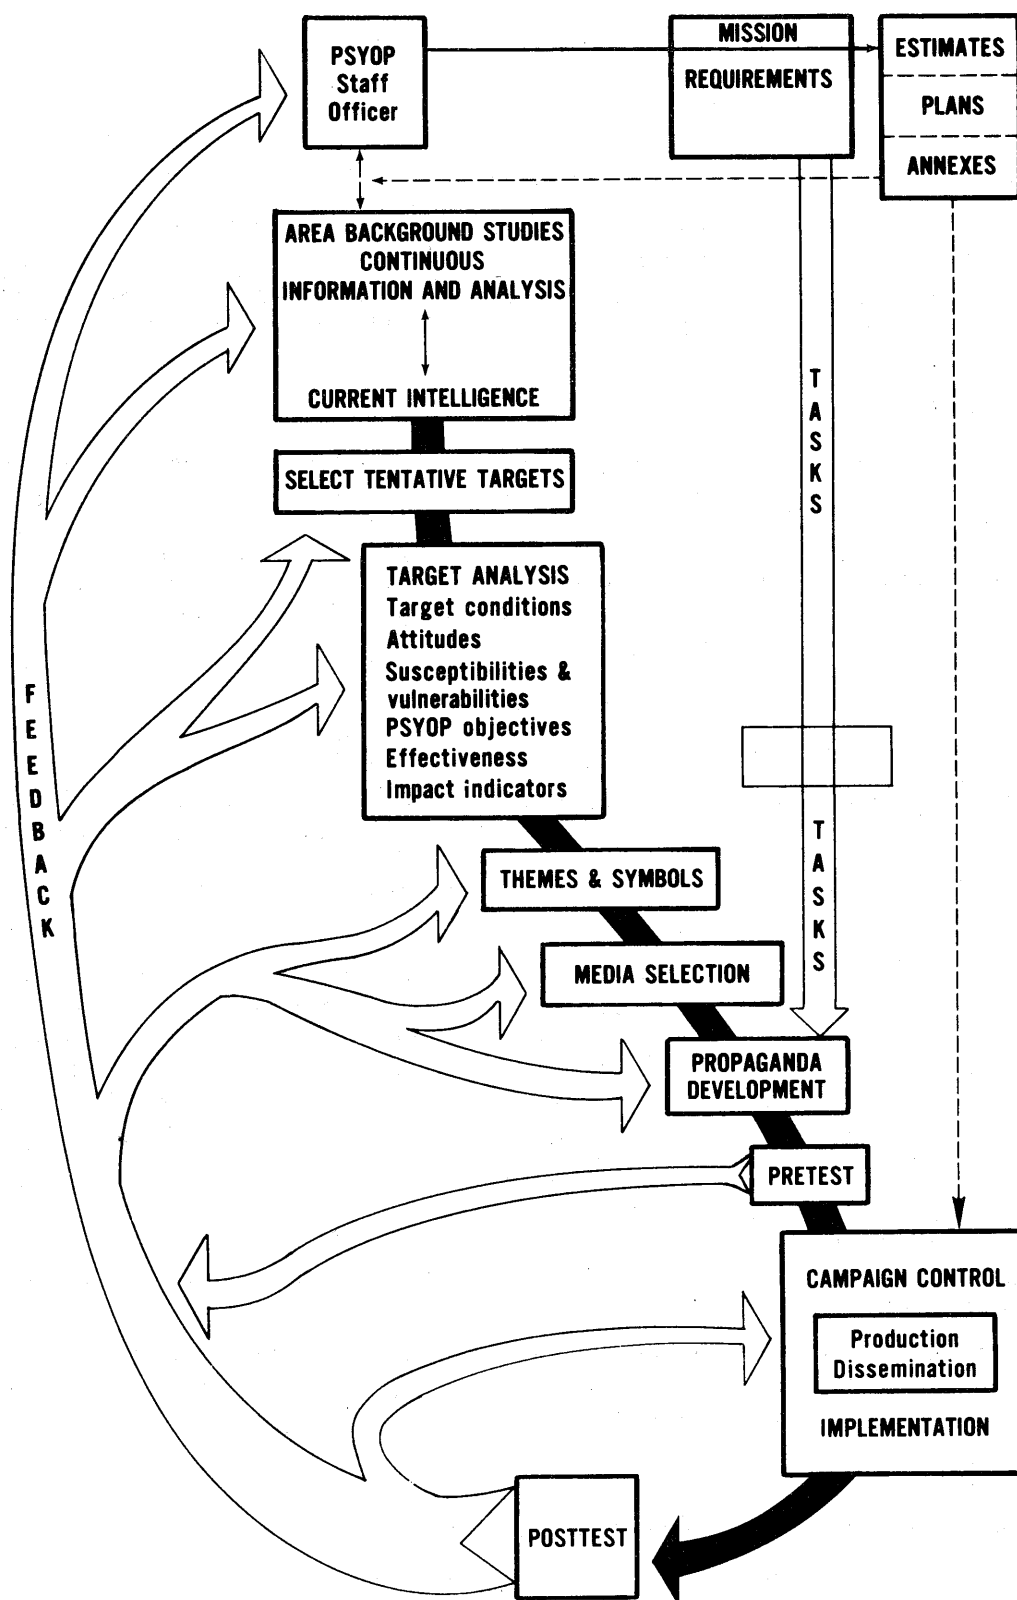

FIGURE 12-1
PSYCHOLOGICAL OPERATIONS FLOW

IMPROVING THE PRODUCT

Successful propaganda is both credible and persuasive. Building credibility requires consistency and time. Of the many factors entering into the establishment of credibility, one of the most important is an accurate target analysis. Credibility will be enhanced when the themes relate to the needs and wants of the target audience and are kept within their frame of reference. Experience indicates that the persuasiveness of propaganda to a hostile audience is increased when the propaganda is objective and indirect--the more hostile the audience, the more objective and indirect the propaganda.

Personal messages for delivery or transmission to individuals or groups in a target audience by a former associate or relative should contain intimate details known only to the source. They should be a means of identification to the intended audience.

In addition, the source must be clearly identified with sufficient information so there is no doubt as to his identity. This reinforces the credibility of the message.

AVOIDING THE COUNTERPRODUCTIVE

The following statements apply in limited, general, and cold war:

In a foreign internal defense situation, avoid propaganda that places the host country in a secondary position. US Army psychological operations support host country efforts.

Do not use terms, weights, or measures that are foreign to the target audience.

Do not translate directly from English to a foreign language. Instead, give the linguist an idea or concept and have the concept phrased in the local language.

Do not add credence to enemy propaganda through words or actions.

Make definite positive statements. Avoid the negative. Do not appear uncertain.

When preparing messages for dissemination, follow the rule **any statement or action that can be misinterpreted will be misinterpreted**.

Do not distribute propaganda that can be easily altered by the enemy to their advantage.

Avoid themes to which host country and enemy troops are equally vulnerable.

Do not insult or anger the target audience. Keep their minds open and their emotions friendly.

Do not use strong threats. Use threats only to meet or arouse a need, and present them as facts.

Do not give free publicity to enemy atrocities in the host country.

Use enemy atrocities to gain sympathy abroad.

Keep all promises; if uncertain of ability to deliver, don't promise.

Security permitting, warn civilians of impending artillery fires, naval gunfire, and aerial bombardment.

PSYCHOLOGICAL OBJECTIVES

A psychological objective is derived from the mission. It may be a single step or a series of steps designed to lead the target audience toward the behavior or attitude desired to accomplish the PSYOP mission. Changes in conditions may bring about changes in psychological objectives.

Psychological objectives are classified as:

Cohesive. Those whose achievement would strengthen or more closely unite the society or target group.

Divisive. Those designed to separate the individual from his group, separate a group from other groups or a society, or disorganize a group or society.

THEMES

A theme is a subject, topic, or line of persuasion used to achieve psychological objectives by exploiting existing vulnerabilities. Themes are the bridge between propaganda opportunity and the response which the psychological operator is trying to elicit.

Each theme should stand alone. It must, however, be coordinated with all relevant agencies to insure consistency and support for national objectives and policy.

Each theme should deal with only one subject. Do not complicate a theme by trying to achieve several objectives. Use separate themes for each objective.

Themes should be selected to persuade the target audience to adopt the course of action wanted by the psychological operator. The audience is motivated by telling them what action is desired, why it is desirable to them, and then showing how it fulfills their needs. Do not use negative themes to achieve positive action, as they tend to be counterproductive.

Make surrender/defector appeals on safe-conduct passes. Insure that the leaflets on which the appeals are made state that they are safe-conduct passes.

State that surrender may be made without a pass.

Stress that surrender may be made to any unit.

Inform all US/friendly units of the surrender/defection policy, so that those enemy who try to surrender or defect are not shot in the attempt.

Defection and desertion appeals are used to encourage individuals or groups among enemy forces to place personal considerations above group interests. Desertion/defection appeals should give absolute, specific assurance of good treatment, and cite honorable and worthy reasons for desertion or defection. When appropriate, use defectors to criticize their own government and military forces. Their message is personal and will have a greater effect than that of outsiders.

Family appeals are very effective, but should be disseminated in the enemy area only; if they are circulated where friendly troops prevail, they may cause desertion among host country troops.

Explaining the presence of foreign troops in the country is a major task. Items prepared to explain this presence should be pretested extensively to insure they cannot be misinterpreted as boasting. Similarities of culture and national goals between the host country and the US should be stressed. Differences between the host country/allies and the United States should be deemphasized.

THE MESSAGE

A propaganda message is a communication with the purpose of bringing about an action and an attitude. Before it can accomplish its purpose, it must get a hearing by the designated receiver (target). In brief, **a message must be received, be understood, be believed, offer a solution, and bring about a desired result.**

Given a policy, intelligence, a target, themes, and appraisal of the desired results, the propagandist composes his message. He must construct, time, and transmit his message so that, even though in competition with considerable other material being presented to the target, it gets a hearing. The target must understand the message and give it the interpretation intended by the propagandist.

A propaganda message must arouse or stimulate needs. It must cause an action or bring about an attitude desired by the propagandist. This requires that the message tell the target how to satisfy its needs--by following the course of action desired by the propagandist. This, in turn, requires that the actions (urged openly or implied) be appropriate and important to the target. In order to get the action or attitude desired, the message must, in the opinion of the target, offer the best solution (or the only logical one) toward solving the problem addressed or in fulfilling target needs.

In essence, the propagandist must take all necessary steps to assure that the action he desires will succeed and that the action he does not desire will have the least opportunity to appeal to the target; i.e., that the undesired action will fail.

MESSAGE STRUCTURE

The propaganda message should be clear, concise, and coherent--a precise item without extraneous material; everything in it must contribute to the whole message, providing a coherent flow without the use of filler material.

In preparing a message or line of persuasion, avoid abstractions if possible. Make maximum use of specific and factual examples and photographs.

If abstractions are used, define them in the simplest terms.

Relate the message to the everyday life of the audience.

Since the target is suspicious and will look for hidden unfavorable meanings, insure that only one interpretation, the intended one, can be given each sentence.

Since the target has a different background and frame of reference, do not use unfamiliar idiomatic expressions or jargon.

Use clear and complete statements.

Develop thoughts in the logical sequence of the language used by the target audience. Do not leave any thoughts for the target to fill in. The key question to ask is, "Does the audience understand what it means?"

Use the level of language that is correct for the literacy level of the target audience. For semiliterates, it is best to use their regional dialects and idiomatic expressions.

*Chapter Thirteen***13****CONCEPT OF EMPLOYMENT**

In war, the side which most effectively influences the psyche of man will have the strategic advantage, fight the better fight, and win the victory and the peace.

ROLE OF PSYCHOLOGICAL OPERATIONS

Psychological operations are interrelated with national, ideological, economic, foreign, and military activities. They establish, maintain, and reinforce the effect and credibility of these integrated functions. Concerted, systematic, and comprehensive psychological programs support US military services and the government agencies and departments concerned with national security.

US ARMY PSYCHOLOGICAL OPERATIONS

PSYOP personnel support and complement planned operations. They also assure that the psychological impact of planned and executed operations and military activities are made known to the commander. These might include stationing of forces, deployments, official and personal troop expenditures and conduct, and storage of munitions and weapons.

PSYOP are aimed at three major foreign target groups:

Enemy

Psychological operations attempt to demoralize the enemy soldier or hostile civilian, undermine his cause, obtain favorable behavior, and develop opinions, emotions, and attitudes to reinforce that behavior.

Uncommitted

Psychological operations must develop favorable behavior in the uncommitted and reinforce favorable opinions, emotions, and attitudes.

Friends

Psychological operations must keep friendly groups and individuals assured of the eventual victory.

NATIONAL OBJECTIVES ABROAD

In the area of foreign policy, psychological operations may have the mission of supporting political objectives, gaining support and cooperation of neutral countries, strengthening or weakening alliances, deterring nations from aggression, and bringing about the final surrender of the enemy.

MAJOR MILITARY OBJECTIVES

Joined with the persuasive psychological pressures generated by combat situations, PSYOP can help to lower enemy morale, reduce combat efficiency, encourage defection and desertion, participate in deception operations, and add a multiplier effect to existing forces to bring about more efficient accomplishment of the mission.

Lower Enemy Morale

Sustained use of PSYOP stressing unfair treatment of ethnic, economic, social, political, and regional groups or minorities can produce a divisive and depressing effect upon the morale of enemy units and the civilian population. Exploitation of a deteriorating enemy military and political situation can also accomplish this.

Reduce Combat Efficiency

Steady psychological attacks upon morale, integrated with other military operations, can lower the combat effectiveness of enemy troops. This may be done by emphasizing the growing strength of allied forces, the lower civilian morale, enemy combat defeats, and destruction of enemy industrial capacity.

Encourage Defection and Desertion

Enemy soldiers subjected to psychological operations over extended periods can be induced to malingering, desert, defect, fail to perform their duties effectively, fight dispiritedly, and surrender.

Deceive

PSYOP can support tactical deception plans of the commander; e.g., convey deceptive information. But no deceptions which are contrary to the law of war (e.g., broadcasting falsely that an armistice or cease-fire has been agreed upon) will be conducted. Use of deceptive information requires that subsequent effects on the future credibility of PSYOP information be carefully considered.

These objectives are attained by propaganda and deliberate actions with planned psychological impact. Any means of communication may be used to deliver the message. Whether used singly or combined, the entire communications effort must be centrally coordinated and integrated. Messages may be transmitted overtly or covertly.

LIMITATIONS

The psychological operator must be aware of and overcome the limitations of PSYOP. These include:

Enemy Countermeasures

The effectiveness of PSYOP is limited by the enemy's ability to use political and military sanctions against people within its territory and its ability to intercept

communications, emanating both within and beyond its boundaries, aimed at people within its territory. Enemy counterpropaganda will also act as a damper against US/friendly psychological operations.

Incomplete Information

Lack of or incomplete information will limit the number of vulnerable targets.

Difficulty Evaluating Effects of Own Propaganda

Stringent enemy restrictions on news, public discussions, and travel limit accurate assessment of US/friendly PSYOP efforts.

Lack of Coordination

A lack of planning and operating coordination between military units, headquarters, and services and between civilian and military agencies will limit and adversely affect US/friendly PSYOP.

Lack of Qualified Personnel

Effective PSYOP require dedicated, imaginative people who know the language and customs of the target audience and are familiar with the political, economic, social, psychological, and ideological conditions of their society. Such people are scarce.

Law of War

The psychological operator is limited in his actions and words by the proscriptions (listed in FM 27-10) of the laws of war set forth in the Hague Conventions, Hague Regulations, and Geneva Conventions of 1949, and other sources. These proscriptions constrain the actions of the United States in conflict situations and must be observed by US military personnel.

MAJOR OPERATIONAL CONSIDERATIONS IN STRUCTURING A PSYOP FORCE

MISSION

The PSYOP mission is derived from that of the supported force; therefore, the mission of the supported force is the major factor in structuring a PSYOP force.

Realistic appraisals must be made of PSYOP capabilities within the limits of national policy and command directives, and available personnel and material resources. The ability to plan and execute a PSYOP campaign may be limited by a number of factors, such as:

- US/friendly nation national policy.

- The realities of unit, service, or agency priorities.

- United States vis-a-vis friendly nation priorities.

- Deficiencies in number and quality of personnel.

- Lack of and deficiencies in material resources: facilities, equipment, parts, and supplies.

TARGETS

The primary targets of PSYOP are groups: political, social, economic, cultural, ethnic, racial, religious, military, intellectual elites, farmers, laborers, government employees, white collar workers, etc. But knowing your target is not enough; the type of media through which the target audience can be influenced must also be known.

Accessibility of the target will determine the type of campaign to be implemented and the propaganda mix. The major factors determining target accessibility are political, geographic, literacy rate, and communications media available to the source and to the target. These factors play a key role in determining the type campaign to be implemented and the media mix.

MEDIA

Among the major factors determining the proper media mix are the present or anticipated political situation, geographic restraints, the literacy rate, and the availability of a particular medium. National sovereignty, national policy, international relations, the location of the target within political boundaries, and whether the target is under US, friendly, enemy, or neutral political control must be considered.

The geographic area of operations is as important in planning and executing a psychological operation as it is for all other operations. The location, climate, physical features (large bodies of water, high mountains, extensive desert, swampland, vast plateaus, low mountain ranges, great prairies, etc.) not only determine the type of propaganda that can be disseminated and the means, but, more important, the type, density, and availability of target audiences.

The psychological operator must keep in mind that within a geographic or political area, the literacy rate of target groups may vary from almost complete illiteracy to complete literacy. The literacy rate of the target audience will determine whether printed material should be distributed, and, if so, what type. It will determine the type of radio, television, audiovisual, and theatrical programs to be presented as well as the level and type of interpersonal (face-to-face) communications.

While the most effective medium is face-to-face communication, major reliance must be placed upon use of mass media in PSYOP campaigns. Logistical considerations and message authenticity and credibility force the PSYOP planner and operator to look to "on-the-ground" facilities, equipment, personnel, and supplies.

Use of local media: Policy, agreements, and legal contracts must permit the use of local mass media resources, and funds must be available to obtain their use.

Except for normal business agreements and contracts, use of local mass media resources in foreign areas requires joint US/HC approval. Legal clearances must be obtained before planning for, or attempting to use, local media.

Availability of receiving equipment: Two of the major mass media, radio and television, require both transmitting and compatible receiving equipment.

It is not enough to know that radio and television equipment are available (and perhaps in widespread use). The planner and operator must also know whether they are compatible with his transmitting equipment. He must know whether the equipment in the hands of the target will receive the message. For example, radio communications

may be under strict, closely policed government control, which limits radio receivers to a single government channel. It may not be feasible nor economical to slide into this channel. Thus, radio cannot be used.

Television: Throughout the world, there are several television transmission systems requiring specifically designed receivers: the receivers compatible with one particular system are not compatible with others.

LOGISTICS

Use of locally available supplies not only lends authenticity to propaganda, but also alleviates the logistical burden of transoceanic or transcontinental shipment. The best sources for locating local material are indigenous people who have worked in the communications field. US and host government and private personnel and agencies can render great service in locating facilities, equipment, and supplies.

In an overseas operation, the breakdown of a simple part may put a vital piece of equipment out of operation for months. If locally produced equipment is used, parts are usually readily available for installation, thus reducing the downtime. Maintenance is always a factor in using complex mass media equipment. Use of locally manufactured equipment that can be readily repaired by indigenous mechanics who have been factory or dealer trained simplifies maintenance problems and eliminates the costly, nonproductive process of training local mechanics to repair unfamiliar US-produced equipment.

CONTROL

The missions and location (geographic spread) of supported units must be considered in determining the management responsibilities of PSYOP command and control personnel. Supported forces may be so widely spread out that additional PSYOP command and control personnel are required. Due to the nature of PSYOP management (central policy guidance with decentralized execution), the span of control must not be strained. An overly wide span of control can result in an uncoordinated policy that is counterproductive to psychological operations.

LANGUAGE

Spoken and written languages must be authentic. The final product of propaganda reaches the target as language, written or spoken. It is not enough that the language be scholastically accurate. It must also be currently authentic for each target group. This is particularly true of dialects. The target subconsciously weighs the language used; if it isn't authentic, the message fails.

FOREIGN NATIONAL AUGMENTATION

Augmentation is the rule rather than the exception. The US soldier who can get the message across to a foreign target audience is a rarity. Communications, even between people having a common language, heritage, and way of life, are less than perfect. The problems of communicating are compounded in intercultural communications with differing basic concepts of time, divergent core values and objectives, and different interpretations of phenomena and meanings of words. The job can best be done by local nationals or persons formerly resident in a target area (or among a target group) long enough to acquire the cultural traits of the target.

Knowing the language of the target audience does not mean a person has a thorough understanding of the target. For effective PSYOP, the psychological operator must have complete empathy with and be totally immersed into the total current environment (life) of his target audience. His background must enable him, intellectually, emotionally, and culturally, to visualize the circumstances of the target audience from their point of view, situation, and condition. He must know what is most important to the target audience at the particular time his message reaches them. **He must know his target thoroughly.**

The spectrum of requirements for foreign personnel augmentation ranges from idea men, researchers, writers, professional communicators, administrators, artists, and announcers, through translators/interpreters, technicians, artisans, and skilled personnel, to maintenance and service personnel, skilled, semiskilled, and unskilled workers. It may be difficult to find a sufficient number or any persons who have the required education, ability, expertise or skills to meet the needs of the unit. One possible means of overcoming this deficiency is to break the requirement or job into simple components as is done on industrial mass production lines.

Foreign social scientists required to learn the psychological characteristics of a target audience may be unavailable. In this case, empirical observations may be taken from policemen, reporters, political figures (mayors, village or tribal chiefs, etc.), doctors and other healers (shamans, witch doctors, nature healers, etc.). Use of this technique enables the psychological operator to meet a practical need by practical means, with realistic feedback having a practical use.

The idea man must have an intimate, firsthand knowledge of the target people. He must project himself into the target area. He should be well educated by practical experience and background. If he does not have a better than normal education, he must be well read and have an intimate contact with a broad spectrum of the target. Above all, he must know how to put ideas into words, symbols, pictures, and action. In addition:

He must know how to write.

He must be able to make people react.

He must anticipate the reactions of his target.

He must be politically aware.

He must be fluent in the language or dialect of the people.

He must have empathy with the target.

FOREIGN PERSONNEL AVAILABLE

There are three basic sources of foreign personnel:

Local hire.

The majority of foreign personnel employed will be locally hired civilians.

Seconded government personnel.

Another source will be host country government employees whom the host country makes available for use.

Host country military personnel.

A third, excellent source is indigenous military personnel. These individuals who may function across the entire spectrum of PSYOP skills can be more readily deployed and be used in more dangerous areas than civilians.

Another source of foreign personnel is third country nationals. Use of these people may be limited because of potential friction with host country nationals and possible legal problems. They may be limited to a few otherwise unobtainable experts and used for only short periods. In some cases, third country personnel could be nationals of close allies of the host country, and their use would thus pose no particular problem.

Authorization for use of host country personnel is generally proscribed in US/HC agreements and by theater directives. The agreements and directives spell out the precise details of employment--how, when, and where the personnel may be used; wages, bonuses, and other compensation; vacations, leaves, health, and fringe benefits; meals and other privileges; and termination compensation.

ROLE OF FOREIGN PERSONNEL

Almost all propaganda material will filter through the foreign augmentation personnel--from the raw material received as unprocessed information, through the processing stage, to final dissemination and presentation to the target audience--whether as propaganda acts or deeds, interpersonal communications, audio, visual, audiovisual, or printed propaganda.

This is true throughout the entire spectrum of conflict and psychological activities--in pursuit of strategic or tactical objectives; in consolidation operations, FID, UW, or PW operations; or in advisory, training, and assistance missions.

Security Clearances

Ideally and normally, foreign augmentation personnel must be investigated and cleared by appropriate host country and US security agencies. (This is also by US/HC agreement.) Circumstances may arise, however, when personnel may be hired who do not have the desired personnel clearance. The US psychological operator must be aware of the security requirements and procedures and must adhere to the letter and spirit of directives and regulations covering this facet of his responsibilities.

Allegiance of Foreign Personnel

Foreign augmentation personnel owe primary allegiance to their own country, political entity, region, ethnic group, culture, and self-interest. Such allegiance will undoubtedly take precedence over that given to the United States. Normally, allegiance to the United States will extend to those areas and to the extent that the US interests coincide with those to which the foreign personnel give primary allegiance. This may best be summarized by a statement of a foreign employee: "... after all, you Americans must realize that I must live and work here after you are long gone."

Conversely, some local augmentation personnel take on a US orientation (coloring), identifying primarily with their US employer. In so doing, they lose their local perspective (so vital to the success of the operation), perceiving the local target audience from a pseudo-US point of view. The work of such personnel loses its original, essential authenticity and accuracy. This situation sometimes cannot be avoided, and it is difficult for the person(s) having assumed this point of view to regain their original perceptions. Members of host country minorities and of outgroups are particularly prone to this type of identification.

A third, not uncommon, situation is that in which foreign augmentation personnel attempt to "please" the US Army psychological operator, by producing work or a propaganda product which they believe he desires, regardless of its authenticity, accuracy, or potential effectiveness.

Constant Evaluation Required

Because of the problems inherent in intercultural production of propaganda, and the absolute need for authenticity and accuracy, the work of foreign augmentation personnel requires continuous, objective evaluation and cross checking. This must be done to assure that themes are appropriate, symbols correctly interpreted, cultural and social factors accurately evaluated and placed in proper perspective, and that messages are relevant to the interests and frames of reference of the target audience and the psychological objectives.

Duties and Responsibilities of US Personnel

The use of foreign augmentation personnel in the most sensitive and important positions and duties, and in the most menial, does not relieve the US Army psychological operator of any of his supervisory responsibilities or duties; of his responsibilities for assigned tasks, objectives, or missions; nor of his security responsibilities.

On-the-Job Training

Among the major responsibilities, and one whose fulfillment will pay great dividends, is that of implementing an on-the-job training program for local employees. Not only does it build esprit de corps, but it also results in greater efficiency, a better product, and less downtime equipment. It builds a cohesive organization that gets the job done.

*Chapter Fourteen***INTELLIGENCE FOR PSYOP****14**

Effective psychological operations are dependent on the availability of timely, continuous, accurate, detailed intelligence at all levels of command. Only with timely, accurate intelligence can target audiences be identified and analyzed, effective PSYOP campaigns implemented, and persuasive messages prepared and disseminated. The major areas of intelligence activities in support of psychological operations are:

- Research
- Target Analysis
- Propaganda Analysis
- Effects Analysis

Improperly conducted intelligence activities can cause PSYOP campaigns to fail. Target groups may be incorrectly identified, vulnerabilities not properly perceived, inappropriate themes selected, incorrect media chosen, and improper dissemination techniques used.

TYPES OF INTELLIGENCE FOR PSYOP

PSYOP require information concerning or affecting the attitudes and behavior of any target group, military or civilian. This includes information on the social, political, economic, psychological, and ideological environment within the target area. PSYOP have the same combat intelligence requirements as other elements of the force.

CATEGORIES

Intelligence required by PSYOP is divided into two categories: area, special, and basic PSYOP studies; and current data.

Area, Special, and Basic PSYOP Studies: The area, special, and basic psychological operations studies of countries represent an established data base.

Area studies are descriptive in nature and are written for the specific purposes of the proponent agency (e.g., unconventional warfare, civil affairs, etc.). They are usually updated periodically.

Special studies are conducted in response to special requirements and generally contain information of greater depth than other studies. By focusing on one aspect of a country or society, special studies can identify communications patterns and potential target groups, and may contain indicators of the effectiveness of previous PSYOP. They are usually updated on an as-needed basis.

Basic PSYOP studies (BPS) are oriented toward issues of PSYOP relevancy in given countries or areas. They are updated periodically according to priorities established by JCS. A basic PSYOP study, in conjunction with the National PSYOP Policy, is then used as a basis for tactical PSYOP programs. Potential target groups are identified in the BPS.

Current data is used to analyze and select specific target audiences and to determine their susceptibilities. Current tactical intelligence is the information needed to conduct day-to-day operations successfully. It is used to:

- Determine PSYOP essential elements of information (EEI) and other intelligence requirements (OIR) which will later become part of the overall collection plan in conjunction with the operational plans and needs of the supported commander.

- Select themes.

- Provide a basis for developing messages.

- Supplement and amplify existing background data to pinpoint vulnerabilities.

The intelligence required to conduct PSYOP is generally obtained from **unclassified** material. Most of it comes from newspapers, magazines, books, academic journals, studies, and foreign broadcasts. Information obtained through military channels is often classified, not because of the sensitive nature of the material but to protect sources or to conceal the fact that military intelligence personnel are interested in certain unclassified, easily obtained information.

Most of the information in intelligence reports classified for the latter two reasons can be found in unclassified references, and these references should be used as much as possible. Although classified information cannot be used, it is useful as background and reference material.

THE INTELLIGENCE PROCESS

The intelligence process is generally the same for PSYOP as for any other activity requiring intelligence data. PSYOP intelligence needs are integrated into the intelligence efforts of the command by the staff intelligence officer (G2/S2). The PSYOP staff officer and PSYOP units use established intelligence channels to obtain intelligence. They also collect information for the command.

A PSYOP unit has an organic research and analysis (R&A) section to process information. It also collects intelligence during operations when teams are engaged in face-to-face communications. **There is no fixed PSYOP organization to collect intelligence.**

For PSYOP to be effective, qualified PSYOP and intelligence personnel must work together as a team. Individuals with a social science or political science background are ideal; however, training and experience are often more important than educational background.

PSYOP ESTIMATE OF THE SITUATION

Intelligence is needed to form a realistic PSYOP estimate of the situation. This document (or thought process) is designed to determine the best course of action. The estimate of the situation is the end product of the R&A process. It gives a current picture of potential vulnerabilities, susceptibilities, and the psychological impact of the proposed courses of action. The estimate may be written or presented orally. It is normally prepared after receipt of the commander's mission and is based on the commander's planning guidance.

The PSYOP estimate of the situation is valid only for the specific area for which it is prepared.

Since conditions change with events and time, it must be continuously updated as changes occur. Also, different estimates will be needed for operations in different areas. (See appendix D.)

DIFFERENCES BETWEEN THE BASIC PSYOP STUDY AND THE ESTIMATE OF THE SITUATION

The Basic PSYOP Study

The BPS is a detailed background document which describes the PSYOP-relevant vulnerabilities, characteristics, insights, and opportunities that are known about a country susceptible to exploitation. It contains all known political, social, military, and economic factors relevant to PSYOP, the psychological implications, and possible ramifications. It provides sufficient information on a country to prepare and conduct a PSYOP campaign. It is a source document for preparation of the estimate.

The PSYOP Estimate of the Situation

The PSYOP estimate of the situation portrays the current situation in the target country and considers any specific tactical mission or planning guidance.

ORGANIZATION TO SUPPORT PSYOP

To perform adequately the intelligence research and analysis functions required to conduct PSYOP, the intelligence personnel assigned to PSYOP units should be functionally organized. A suggested type organization could include:

Research desks, each staffed by one or more people, with primary responsibilities for areas or regions. Activities include propaganda analysis, preparation of BPSs, target analysis, and furnishing information to support media output. Desk personnel should perform quantitative and qualitative propaganda analysis and establish research files.

An Effects Analysis Section, which is generally concerned with analyzing the effects of US PSYOP on the enemy. It may also be concerned with the effects of enemy PSYOP. Some specific duties should include pretesting and posttesting, review of intelligence reports for signs of enemy reaction to US PSYOP, analysis of captured directives and documents, and the conduct of attitude surveys.

An Editorial and Production Section, which prepares PSYOP material for printing.

A Collection and Publication Section is recommended. It would function as a reference library and distribution center, acquiring, storing, routing, and disseminating all documents in the unit.

ESSENTIAL ELEMENTS OF INFORMATION (EEI) AND OTHER INTELLIGENCE REQUIREMENTS (OIR)

(See FM 30-5)

Essential elements of information are the critical items of information regarding the enemy and his environment needed by the commander by a particular time to relate to other available information and intelligence in order to assist him in reaching a decision.

Essential elements of information consist of a series of specific and pointed questions designed to get the information needed on target groups. These questions should cover the basic psychological, sociological, politico-military, and economic environment of the area and target, such as:

- Attitude of target toward present situation.

- Complaints.

- Ethnic origin.

- Frustrations.

- Languages used.

- Problems.

- Tensions.

These are just a few of the areas about which definite information must be obtained before the vulnerabilities and susceptibilities of the target group can be determined.

Other intelligence requirements derive from command requirements which do not qualify as EEI and from staff requirements. OIR consist of information (other than EEI) on other capabilities, vulnerabilities, and characteristics of the area of operations which may affect the accomplishment of the mission.

Many of the EEI and OIR are of a recurring type, even though the subject (target group) may vary. The areas above can and should be broken down into subelements when developing EEI and OIR.

The intelligence officer developing the requirements should not assume that the collectors know the situation and what information to seek. For example, the EEI/OIR needed on a hostile civilian population will differ from the EEI/OIR needed on enemy troops. The requirements should be explained as clearly as possible and coordinated with other sections involved. Coordination should be effected with the PSYOP sections involved in planning operations; preparing and disseminating media, and developing PSYOP campaigns, to insure that their information needs are included. (For formulation of EEI and OIR, see p. 4-1, para 4-2; p. 4-2, para 4-5; and index, FM 30-5.)

Vulnerabilities and susceptibilities of the target are identified from target analysis, which is a combination of information gained from the EEI, OIR, and R&A.

Vulnerability

A vulnerability is a condition which can be exploited by the psychological operator. Vulnerabilities can be developed from either strengths or weaknesses. They exist within friendly, enemy, and neutral targets. They may be based upon situational or cultural factors.

Susceptibility

Susceptibility is the degree to which the target can be influenced to follow the course of action desired by the psychological operator. Susceptibilities determine the lines of persuasion (themes) which can be used to influence the target. Susceptibilities are determined through the use of intelligence, information, and objective reasoning.

If susceptibilities and vulnerabilities are not properly assessed and identified, themes (the basis of successful PSYOP campaigns) will be inappropriate to the target audience, resulting in inappropriate, ineffective campaigns.

Using all of the above properly, intelligence personnel must develop and recommend specific themes that will have the desired effect on the target groups. Themes must conform to US PSYOP policy and be timely, consistent, and credible. Appropriate symbols (visuals signs or objects used to convey a message or idea) increase the impact of themes.

The decisions on the media and techniques to be used will be based on the initial research and the intelligence gathered. Media development and dissemination are discussed in chapters 17 and 18.

INTELLIGENCE ACTIVITIES

Basic Psychological Operations Study (BPS)

The BPS, a basic source of valuable information, is a systematic description of the factors that affect PSYOP in a country. The format and guidance on what to include in a BPS are presented in appendix C.

When either reading or writing a BPS, certain terms pertaining to the BPS must be kept in mind:

Relevant event. An observed behavior of a type which can be described in terms of "who does what to or with whom." It has implications affecting the behavior of a large segment of the country's population or the political system. A relevant event has five essential components: an actor, a target, some activity, an issue area, and time. It does not ordinarily, by itself, constitute an issue.

Relevant issue. A highly emotional issue, deeply rooted in the country's history, customs, fears, and foreign policy, which, under certain circumstances, could cause either change or resistance to change in the population or political system.

Relevant data. Events of importance to large segments of the population because they are sources of conflict.

Intelligence Analysis

Collected information must be analyzed before it is intelligence. The analytic process relies heavily on mechanical devices and quantitative techniques so that all information on related subjects can be identified and compared. Some frequently used aids are charts, maps, tables, periodic digests, cataloging, and filing systems.

Completeness and standardization are essential because the collected information must be categorized and carefully evaluated against other related information. Each piece of information is scrutinized to determine its relationship to the whole picture and the extent to which each bit of information confirms, supplements, or contradicts others. If the analyst has any doubts about the truth or relevance of any information or reports, he should state these doubts clearly. No analyst will ever write a perfect report, completely accurate and unbiased. To make allowance for human error, as many independent reports as possible should be gathered on each item to either confirm or deny its probability.

In interpreting information, an analyst must always consider:

What is the relationship of this information to what is already known?

Does it alter, confirm, refute, or add to the information previously received?

Does it tend to confirm or refute the existing estimate of the enemy situation?

Target Analysis

Target analysis supports the development of PSYOP estimates, plans, orders, and directives. It is covered in detail on page 14-10.

Propaganda Analysis

Propaganda analysis supplements the more conventional forms of intelligence. It is valuable because it indicates conditions or attitudes that exist within an area of operations. Conclusions based on propaganda analysis should be checked out by other intelligence methods before being fully accepted. See chapter 16 for a detailed study of propaganda analysis.

THE RELATIONSHIP OF THE PSYOP INTELLIGENCE OFFICER WITH THE INTELLIGENCE STAFF OFFICER, G2/S2.

Since PSYOP is a user and producer of intelligence, the PSYOP intelligence officer must work closely with the G2/S2 both in collecting intelligence for the command and in acquiring data which specifically support EEI and OIR of PSYOP interest.

Some PSYOP abilities and factors that the commander and his staff must be aware of and take into account while planning their operations are:

The ability of PSYOP personnel to forecast situations which may be exploited by either US and friendly forces or by the enemy. If a proposed course of action will create a situation or event that could serve as the theme for an enemy propaganda campaign, the commander and his staff must be aware of this before they make a decision.

The ability to explain US objectives, goals, and policies to the enemy and to hostile civilians.

The ability to contribute knowledge of the psychological vulnerabilities of enemy units and populations to meet order of battle, combat, and strategic requirements.

Some specific tasks which can be levied upon PSYOP in support of intelligence operations are:

Determine if war weariness exists among the military and civilian population, and, if so, how to exploit it.

Identify and exploit enemy mistakes with propaganda.

Find PSYOP opportunities to support the command.

Identify enemy propaganda, its approaches and themes.

Identify differences and hostilities in enemy groups.

Determine how to overcome the effects of enemy indoctrination.

SOURCES OF INFORMATION AND INTELLIGENCE

Intelligence Collection Requirements (ICR)

Information and intelligence needed on a continuous basis, over a long period of time, can be designated as an intelligence collection requirement (ICR) to be automatically added to

all future collection plans and sent to collection elements. Unless a specific termination date or event is given, this will continue until the ICR is cancelled by the originator.

Interagency Document Request

The Interagency Document Request, DD Form 1142, is a convenient and common way to request information or intelligence, in documentary form, from components of the US Government. When this form is used to request classified information, it is sent through intelligence channels for proper validation and transmittal. This is done to give higher intelligence authorities a means to keep aware of intelligence and information requests from lower level units. If the requested document is not held in a repository at a lower level, the DD Form 1142 will go to the Defense Intelligence Agency (DIA) library. A PSYOP unit must have a DIA customer number before such a request will be honored. The Interagency Document Request must cite the particular document wanted and length of time wanted.

DIA Dissemination Center

The DIA Dissemination Center mails documentary materials directly to its customers. Materials are accumulated according to the stated subject interest and periodically mailed directly to DIA customers. All DOD components conducting or involved in intelligence research and analysis, collection, processing, and storage are entitled to become customers of the DIA and to be mailed documents that meet their interests.

Need for Specific Information

If a specific item of factual information is needed and not available, the PSYOP unit may fill out an Intelligence Collection Requirement form, DD Form 1365, in accordance with DIA Instruction 58-1. This request must go through the staff intelligence officer and through intelligence channels to an approving official. The ICR will then go to all those intelligence collection agencies able to collect such information. This is a time-consuming process appropriate only for information of strategic value.

In all dealings with the intelligence community, PSYOP personnel must realize that intelligence is collected on a combat priority basis, and generally, PSYOP is not given the highest priority. For this reason, documentary information obtained from the intelligence community on issues of interest to PSYOP may be incomplete or perhaps nonexistent.

Written and Human Intelligence

The PSYOP researcher can evaluate and determine the current issues of primary concern to the target from newspapers and magazines. Since they are published regularly, changes in attitudes and issues can be recognized and incorporated into propaganda campaigns.

Bibliographies, such as the Reader's Guide to Periodical Literature and Public Affairs Index, list articles appearing in magazines and other publications. For a current topic, or for one with depth in time, the researcher can use these bibliographies to compile a list of publications on a particular subject. Some publishers issue bibliographies which deal only with one publication. For example, the New York Times Index permits the researcher to search out and locate articles on a particular topic that have appeared in the New York Times.

Captured documents, official and unofficial, are a good source of information on enemy plans, weaknesses, policies, and needs. Official documents are plans, orders, maps, manuals, government studies, and other such items. Unofficial documents include diaries, pictures, and personal letters.

PSYOP personnel conduct interviews and interrogations to obtain information peculiar to PSYOP.

Prisoners-of-war and defectors are normally able to provide information on the attitudes and conditions within their units. This includes such information as the quality of leadership, personnel policies, disciplinary problems, medical conditions, and other facts and opinions which can be used in PSYOP planning. It is important that the PSYOP interrogator has early, direct access to these individuals (the interrogees). If possible, it is best to sit in with the intelligence interrogator during his briefing. This saves time since the intelligence man will be interested in many of the same areas as the PSYOP interrogator.

Refugees can give a grass roots view on conditions and attitudes of the populace and the area they come from.

Civil administrators, aware of the needs and attitudes of the people for whom they are responsible, can give information on the plans and means to solve local problems and can identify problems which have not yet been solved.

Civil and paramilitary police are knowledgeable of the area, its people, their habits, political leanings, and every aspect of community activities.

Liaison

Liaison with agencies and groups outside of the Department of Defense to make them aware of PSYOP information needs often can produce much needed information. Some agencies which can assist PSYOP in obtaining information about local conditions and the situation in a target area, or among target groups, are:

- Treasury Department
- Federal Bureau of Investigation
- Central Intelligence Agency
- Political Section, US Embassies
- International Communication Agency
- US Agency for International Development
- Drug Enforcement Administration
- Foreign Broadcast Information Service
- Library of Congress
- Publication Procurement Officers

PSYOP AUTOMATED MANAGEMENT INFORMATION SYSTEM (PAMIS)

PAMIS is covered in chapter 15. It is a source of information which can be used in PSYOP for

various purposes. It can help the PSYOP unit to:

- Prepare PSYOP estimates.
- Prepare PSYOP annexes.
- Analyze enemy target groups.
- Identify enemy vulnerabilities.
- Analyze media from the target area.
- Analyze propaganda received from friendly areas.
- Insure propaganda appropriate to the target.
- Prepare Basic PSYOP Studies.

TARGET ANALYSIS

Target analysis is a detailed and systematic examination of processed intelligence to identify and locate target audiences, identify conditions, pinpoint vulnerabilities, establish objectives, and obtain pertinent information to guide PSYOP personnel. It is the basis for the development of PSYOP estimates, plans, orders, directives, and campaigns. It is also the basis for selection of themes, symbols, and media and for the development of persuasive messages.

Identification and Location of Target Audiences

The initial step which is undertaken by the research and analysis teams is the identification of tentative target audiences. After selection, each one is systematically examined to determine its suitability. This profiling of each target is the core of the target analysis process.

To aid the analyst in identifying and locating potential target audiences, a general guideline has been established:

Target audiences are collections of people who share the same predispositions, which, when successfully manipulated, will lead to the accomplishment of the desired psychological objective.

Of particular importance is the phrase "share the same predispositions." For PSYOP purposes, target audiences are classified as groups, categories, and aggregates.

Groups. Groups are the preferred target audience because they normally are functional, with members bound together by common activities and goals. Since there is a specific reason for its existence, the group can be studied more precisely than any other collection of people. Moreover, more valid and definitive statements can be made concerning group conditions and attitudes.

Categories. Often it will be necessary to direct persuasive communications to large collections of people not classified as groups. To satisfy this requirement, the target analyst may identify a category as a target audience. Unlike groups, members of categories have no clearly definable reason for gathering and normally would carry on no personal interchange, thus limiting the persuasion possibility.

When studying categories, the analyst may find only very tenuous common interests, such as economic, education, social mobility, and ethnic identity among the members. Therefore, information obtained about categories will be more general than that obtained about groups.

Aggregates. A collection of individuals identified by a common geographic location may also be used as a PSYOP target audience.

Possible Results of Persuasive Communications

Persuasive communications should cause the members of a category or aggregate to form common points of reference. Should these people develop sufficient interest, however, they will technically become a group. As a group, this assortment of people will make a better PSYOP target.

As a general rule, the target analyst should attempt to analyze both categories and aggregates precisely by seeking to identify primary and secondary groups within each collection.

Selection of target audiences. Target analysis is conducted to determine if each tentative target is susceptible and will be effective in the achievement of specific psychological objectives. Even though several target audiences may be vulnerable, they may not be equally susceptible and effective in this respect.

Target analysis worksheet. To assist in deriving specific and useful information for the conduct of PSYOP, a systematic procedure has been devised. This procedure calls for the use of the target analysis worksheet (appendix F). The worksheet is a guide for systematically analyzing data relative to tentative targets: the national objective, mission, target audience, target conditions, attitudes, susceptibility, psychological objective, target effectiveness, and impact indicators.

The national objective is obtained from US policy statements and documents. Sources for US objectives relevant to US Army PSYOP might be unified command military plans, ICA Country Program memorandums, Departments of State and Defense policy statements, and other related command and PSYOP guidances. The PSYOP mission may be directed or derived from a stated mission, or, for planning purposes, it might be deduced from operational objectives.

STEPS IN TARGET ANALYSIS

Step 1: Select a tentative target for analysis.

Select one tentative target from those identified in the Basic PSYOP Study. This selection should be based on:

- The supported tactical commander's needs and plans.
- The PSYOP mission as directed by the supported tactical commander.
- The factors which indicate the tentative target's vulnerabilities which can be breached with persuasive communication.
- The target's predispositions relative to a mission.
- Other situational factors which indicate the suitability of the group as a susceptible and effective target audience.

Step 2: Determine conditions affecting the target.

Conditions of the target refer to the external elements which affect the target but over which they have no control. These circumstances are the result of social, economic,

political, and military pressures and the physical environment.

Each condition selected must be considered in view of the target audience's awareness of the condition. The analyst must surface positive and negative influences to insure that a biased image of the target audience is not formed. The analyst must also consider the PSYOP task to be accomplished.

Step 3: Analyze attitudes of the target audience.

Attitudes may or may not coincide with behavior. They are the determinants of noncoerced behavior. For this reason, a major goal of a campaign is to reinforce or develop attitudes which support US psychological objectives. In addition to determining positive and negative attitudes, the psychological operator must determine their intensity; i.e., how strongly the target audience is predisposed to respond to the conditions which affect it.

Step 4: Determine target susceptibilities.

Susceptibilities vary with each PSYOP objective because the target responds in different ways and intensities to different appeals. Susceptibility will depend in large measure upon the values, needs, motivations, and drives of the group.

Values which must be taken into account when dealing with susceptibility include:

By whom do they expect decisions to be made? Do they accept decision from a single, all powerful source and believe that this is the way things should be done? Is there individual decisionmaking in the target group without regard for external authority, or is the democratic approach used?

How does the target regard man's relation to the physical and supernatural elements of nature? Is he superstitious, a stoic, or a fatalist?

What regard do members of the target audience have for time? Are they preoccupied with the past, present, or the future? If the time perspective is oriented toward the past, appropriate appeals might stress the need to preserve the customs and practices of the past.

Step 5: Formulate the psychological objective.

The psychological objective is based on the specific and implied tasks obtained from the mission and from target analysis. A psychological objective might be a single step or a series of intermediate steps designed to lead the target audience towards the desired behavior or attitude.

Should it be necessary to have a series of intermediate objectives, each one must be measurable and must accurately define the specific behavioral or attitude change desired. Each intermediate objective must be completed in logical order.

When establishing measurable activities for the target audience to accomplish, present activity levels must be determined and changes brought about by the psychological operations noted. Changes in attitude are more difficult to measure quantitatively than changes in behavior.

Attitude changes cannot be measured directly; they must be inferred through changes in the observed behavior of the individuals who constitute the target group. The psychological operator must, therefore, identify the relevant behavior indicators, determine the existing pattern of such activities, and establish methods by which to measure subsequent changes.

Psychological objectives are classified as cohesive and divisive.

Cohesive objectives: Cohesive objectives, whose successful achievement would strengthen or more closely unite the total society or particular target groups, encourage the individuals of the target audience to place the collective good above the individual good. Example objectives are good will, encouragement, compliance, and cooperation.

Good will is used to promote feelings of friendship toward the country or agency sponsoring the PSYOP effort and to convince the target audience of the desirability of the programs and goals of the sponsoring country.

Encouragement is used to foster confidence in the target audience in the success of the policies of the sponsoring country or agency and its allies, to sustain the morale of elements in the friendly country, and to identify the aims of the sponsoring country or agency with the popular or national aspirations of the people.

Compliance and cooperation are used to win acceptance of the policies of friendly authorities and the sponsoring country's military, paramilitary, and public safety forces; to encourage and stimulate support and participation in national programs; and to attract support of the country's aims and programs.

Divisive objectives: Divisive objectives are designed to separate the individual from his group, to separate a group from other groups, to separate a group from the society, or to disorganize a group or society. These objectives encourage the individuals in the target audience to place their self-interest above the interests of the group. Examples of divisive objectives are discouragement, defeatism, apathy, hostility and non-cooperation, discord, withdrawal, panic, subversion and resistance, surrender, defection, and desertion.

Discouragement, defeatism, and apathy are used to depress the morale of the target audience in order to reduce the degree of effectiveness of groups supporting popular or national aims dangerous to the interests of the sponsoring country.

Hostility and noncooperation are used to promote disbelief in the policy and ideology of the local and national authority hostile to the sponsoring country.

Discord is used to stimulate dissension and conflict within or between specific groups.

Withdrawal is used to intensify concern of the individual with his personal situation in order to reduce his support of group and national goals.

Panic is used to promote disorganized or confused behavior.

Subversion and resistance are used to encourage divisive and antipolitical acts, thereby undermining the political structure of the country, and to promote and support resistance movements against authorities hostile to the sponsoring country.

Surrender, defection, and desertion are used to encourage individuals or groups, among enemy military forces, to place personal considerations over group interests, thereby undermining military authority.

Step 6: Determine target effectiveness.

If it is determined that the target audience can be persuaded, its relative ability to implement a psychological objective must be assessed. The most obvious consideration pertains to the environment of the target audience. The constraints on the target audience which limit its ability to attain a significant objective must be determined. The analyst must also evaluate the ability of the target audience to act on suggested solutions.

In determining the effectiveness of the potential target audience, its relative power to influence other groups must be assessed. This requires a study of the power structure and of the relative positions of the potential target audiences within this structure; that group to which the potential target audience responds and under what circumstances it responds are given particular attention. Other groups in the area that respond to the dictates and desires of the potential target audience must also be noted. Any circumstances under which the standard relationships between the potential target audience and other groups in the area may be altered should also be determined.

The use of key communicators to reinforce the propaganda message and influence members of the target audience must be considered. In the military, especially among hostile military targets, key communicators are most likely to be political officers or the most courageous or aggressive members of the unit. When selecting key communicators, certain characteristics must be identified; among these are prestige, numbers, dispersion, and power.

Prestige: The individual who has prestige is called upon for guidance and leadership by virtue of his position. The prestigious person may rise to power or position because of age, influence, title, or other factors. Because other members of the group expect the prestigious positionholder to provide guidance and make decisions, they are prepared to follow him.

Numbers: There must be enough key communicators within the target audience to influence the audience. If there are only two communicators in a group of 500, their influence may be nullified by the will of the majority.

Dispersion: To be effective, key communicators must be adequately dispersed among the target audience. Dispersion insures maximum influence over the majority of the audience.

Power: The most critical characteristic of the key communicator is power which must be viewed from several perspectives of power: coercive, reward, legitimate, and referent.

Coercive power is the influence that an individual or group exerts over another, based on the ability of the persuader to punish. **It is effective only so long as the power to punish exists.**

Reward power stems from the persuader's ability to reward desired responses. **Reward power provides more satisfactory results over an extended period of time than does coercive power.**

Legitimate power refers to the mutually acknowledged right of an individual or group to control others. It is exemplified by platoon leaders, elected political officeholders, kings, parents, and supervisors.

Referent power is that influence carried by a particular social status, usually based on wealth, political position, birthright, and other factors that have no legal status. It is a common factor in day-to-day life, stemming primarily from the efforts of individuals to identify with a group.

When selecting key communicators, PSYOP personnel must keep in mind that key communicators are not supposed to interrupt the flow of communications. Their job is to receive the message and, by their interpretation, reinforce it among the people in the target audience.

If a potential target audience is not effective, the best course of action is to maintain a link with the group for future utilization.

Step 7: Determine campaign impact indicators.

Before the target analysis is complete, the target analyst must record the behaviors which indicate changes from existing activity levels. The specific behaviors (events) are referred to as campaign impact indicators. Campaign indicators assist in evaluating the effectiveness of PSYOP.

A PSYOP campaign is designed to produce a desired effect (some action, behavior, or perhaps, inaction) upon the target audience. The success of a campaign can only be judged by its effect. Effects analysis determines the impact of a propaganda effort on an audience. It assesses the relative success of propaganda and the reasons why a particular effect was achieved.

Propaganda effects analysis is a difficult task. Even under the best circumstances, it is hard to judge whether attitudes and opinions have been changed by propaganda. During limited or general war, analysis is even more difficult because the effects of propaganda often cannot be seen until the area becomes accessible. In a cold war situation, internal defense and development (IDAD), or consolidation operations the task is somewhat simpler and results are more accurate because the audience is generally more accessible. (See chapter 16.)

FACTORS WHICH CONTRIBUTE TO THE FAILURE OF PSYOP

Information may be difficult to find and requires a subjective (personal) evaluation. Failure to search all sources thoroughly for this information and lack of experienced personnel to make the required seasoned judgments will contribute to the failure of PSYOP campaigns.

Target groups frequently are not properly identified. PSYOP personnel must continuously study information to identify and define target groups clearly. This information is acquired through the submission of good intelligence requirements (EEI/OIR) to the appropriate collection agencies and repositories.

*Chapter Fifteen***15****THE PSYOP**

AUTOMATED MANAGEMENT INFORMATION SYSTEM (PAMIS)

One of the day-to-day problems which can directly affect the quality of work is the massive amount of information that must continually be processed. Without electronic assistance, the information is limited to the content of a file supplemented by personal knowledge. Therefore, an electronic, systematic means of accumulating and presenting large quantities of relevant information is of value to PSYOP personnel.

The PSYOP Automated Management Information System (PAMIS) is designed to assist the PSYOP staff officer, intelligence officer, propaganda analyst, propaganda officer, and others in obtaining, maintaining, and using large amounts of information. It is a set of three interrelated information handling systems:

The PSYOP Foreign Area Data (PFAD) System - An automated means of storing and retrieving textual information, such as analyses, abstracts, extracts, and summaries about a country or region.

The PSYOP Foreign Media Analysis (PFMA) System - An automated means of storing and retrieving coded content analysis data about the mass media of countries of interest to the PSYOP unit or staff.

The PSYOP Effects Analysis System (PEAS) - An automated means of storing, processing, and presenting information pertaining to the effectiveness of PSYOP campaigns, media, themes, and programs.

These three systems are interrelated in that information from one can aid in analyzing data from the other systems.

PAMIS is managed and maintained by the Officer of the Joint Chiefs of Staff in conjunction with the Department of the Army. It utilizes computers and peripheral data processing equipment located in the Pentagon.

PSYOP FOREIGN AREA DATA (PFAD) SYSTEM

The PFAD System provides uniform procedures for the collection, storage, and automated retrieval of PSYOP-relevant information about a country or region of the world. Its purpose is to provide the PSYOP planner with information on which to base plans and estimates, and to provide the psychological operator with information and intelligence on which to base target analysis, propaganda development, and campaign planning.

The PFAD System does not duplicate area handbooks, intelligence annexes and estimates, or other similar materials. Rather, it supplements these with PSYOP-specific information, concentrating especially on facts and data which lead to the discovery of PSYOP vulnerabilities and opportunities.

Sources of material for the PFAD System

The PFAD System accepts material from a variety of agencies or sources: active and reserve PSYOP unit personnel, individual researchers and research institutions, and experts obtained specifically to meet PAMIS intelligence needs. The material references a source (e.g., a book, intelligence report, newspaper, cable, etc.).

PFAD System Contents Records

The PFAD System contains two basic computer records:

Source description record--the essential facts needed to describe adequately the nature of the source publication or document.

Subject narrative record--summary narratives of information about specific PSYOP subjects.

The purpose of the source description is to present to the user a brief overview and description of PSYOP-relevant material, such as books, periodicals, dissertations, government documents, cables, and the like. The user of the PFAD System can evaluate the source description printout (see figure 15-1) and determine whether to obtain the basic source document or to request the appropriate subject abstracts from the computer. He can request a computer printout (bibliography) that contains information on a given country, political group or movement, ethnic, social or religious group, or definitive subject or subjects.

The purpose of the subject narrative is to provide the social, cultural, economic, political, communication media, and other special information needed to make decisions on all aspects of PSYOP. Each entry is a short one-page abstract. Each narrative record, consisting of one or more abstract entries, is coded so the user can request subject data from the PFAD file in any combination of information elements. For example, the user can retrieve all subject information about a given nation or region of a country; he can select those subjects about electronic media relevant to specific population groups; or he can retrieve all PFAD data records on a given PSYOP target. Figure 15-2 is an example of a subject narrative record. In the case of translations into English, the entries may be larger than in the original language. The location and date of publication of the original source will be included, permitting further research.

Information for PFAD System

The agency which does the original research on a given subject provides the information by typing it in specific format on a magnetic typewriter tape. This tape cartridge is then mailed to the National Military Command System Support Center (NMCSSC); there it is converted and transferred to computer tape, and the information is checked and stored in one or two PFAD files: BIBLIOGRAPHY and SUBJECT.

Electronic data processed reports are provided on request. They consist of selected retrievals of key information used to prepare PSYOP estimates of the situation and basic PSYOP studies. Figure 15-3 is a coversheet for a PFAD System output report.

Using the PFAD System

The PFADS programmer is able to review and upgrade the data base by removing information of little or no value. In addition to the review process, the data base is structured to indicate areas in which information is missing so that research and intelligence priorities can be assigned to fill out these areas. By these two processes, the PFAD System provides a means for increasing the quality and quantity of information available for PSYOP uses.

DESCRIPTIVE ABSTRACT OF SOURCE

THIS UNPUBLISHED DOCTORAL THESIS DESCRIBES AND ANALYZES THE SOCIAL ANTHROPOLOGY OF ONE TYPE OF DRUZE VILLAGE IN LEBANON AS IT WAS IN THE EARLY 1950'S. MANY OF THE BASIC SOCIAL STRUCTURES AND RELATIONSHIPS DESCRIBED ARE COMMON TO OTHER VILLAGES IN THE ARAB MIDDLE EAST. HOWEVER, THE RELATIONSHIPS BETWEEN BOTH HORIZONTAL AND VERTICAL GROUPS ARE CHANGING, AS THE AUTHOR NOTES, AND THUS SHOULD NOT BE CONSIDERED NECESSARILY TO REFLECT THE 1973 CONDITIONS IN THIS OR OTHER VILLAGES IN LEBANON AND THE MIDDLE EAST.

SUBJECT NARRATIVE

(STUDY IN FOREIGN COUNTRIES)--SINCE THE ESTABLISHMENT OF THE GDR, ABOUT 10,000 GDR CITIZENS HAVE COMPLETED THEIR EDUCATION AT UNIVERSITIES AND ADVANCED SCHOOLS OF THE USSR, THE CSSR, THE POLISH PEOPLE'S REPUBLIC, AND OTHER SOCIALIST COUNTRIES. THESE GRADUATES ARE NOW RESPONSIBLY FULFILLING IMPORTANT TASKS IN VARIOUS BRANCHES OF OUR SOCIAL LIFE. MORE THAN 600 GRADUATES ARE EMPLOYED AS PROFESSORS AND LECTURERS IN THE GDR ADVANCED SCHOOL SYSTEM. IN 1974 THE NETWORK OF STUDY LOCATIONS WAS CONSIDERABLY EXPANDED. THUS, AT THE PRESENT TIME, ABOUT 5,000 GDR STUDENTS ARE RESIDING AND STUDYING IN 18 CITIES OF THE USSR, IN 9 CITIES OF THE POLISH PEOPLE'S REPUBLIC, AND IN 5 CITIES OF THE USSR.

FOREIGN MEDIA ANALYSIS (FMA) SYSTEM

The Foreign Media Analysis System provides a means of storing, retrieving, and processing information obtained from analysis of foreign communication media. Selected media are analyzed by foreign language coders (normally part of a PSYOP unit) to determine the amount of media space or time devoted to significant subjects or propaganda themes.

The basic unit for the FMA System is the dominant subject (or propaganda theme) of the printed article or news broadcast related to a specific country or government. The coder/analyst is required to follow established conventions and rules in classifying and coding each input unit according to the following queries:

What is the main thrust or manifest content of the printed article or news item?

What governments, international organization, or political movements are the subject of the article or news item?

What is the tone of the article toward the governments or institutions, or international organizations?

How much space (in square centimeters) or time (in minutes) is devoted to the subject?

Does the article or news item contain information of significant personalities, events, or subjects important to PSYOP? Such articles or news items are summarized for the FMA textual file.

This information is checked to insure validity and uniformity of coding and is then keypunched on 80-column cards. The data are transmitted by AUTODIN to the NMCSSC computer site in the Pentagon where it is audited, edited, and stored.

The FMA System provides both standard and special request reports. The standard reports are identified as:

PSY1-01 - Major Subject Categories by Source

PSY1-02A - Report About Theme Countries

PSY1-02B - Report About Other Countries

PSY1-03 - Coverage by Rank Order of Foreign Governments by Tone

PSY1-04 - Coverage by Regions of the World

PSY1-05 - Subject Index to FMA Media

PSY1-10 - Clear-Text or Narrative Abstracts

The purpose of the PSY1-01 printout is to give the analyst a knowledge of:

The square centimeters of space or time (measured in minutes) allocated to broad FMA domestic subjects by each medium over a designated period of time.

The percentage of total coverage allocated by the media to foreign events, governments, and institutions.

The purpose of the PSY1-02A and PSY1-02B printout is to provide analysts with:

A statistical analysis of the amount and tone of media coverage for each country or international organization.

A statistical analysis of communication trends by subject and tone.

A correlation analysis of these data with each of the 700 FMA subjects.

A comparative analysis by content and tone of media directed at the domestic as compared with international audiences.

Hypotheses and inferences from trend data confirming or denying other intelligence.

The purpose of the PSY1-03 printout is to sort by media and tone (critical, neutral, favorable) FMA data on foreign countries. A comparison of three time periods can be processed for any one PSY1-03 report. Any combination of these time periods can be specified by the user.

The purpose of the PSY1-04 printout is to summarize foreign media data about all foreign governments in specific geographic regions. The PSY1-04 printout provides the analyst with a one-page summary of media coverage of foreign governments in relation to other governments according to geographic regions.

In order to adequately analyze foreign communications media, it is necessary to examine the qualitative aspects of a news item or feature article, as well as the quantitative data. In other words, the actual story or news item must be read to obtain the "flavor" of the presentation or arguments in a qualitative sense. The PSY1-05 provides information about the location of articles in the source document or audio tape. It provides a "library" index similar to the New York Times Index for each FMA source. Another purpose of the PSY1-05 printout is to provide analysts with a consolidated listing of FMA data about a particular country or government.

The purpose of the PSY1-10 printout is to provide users with a synopsis of those articles or news items of major interest to PSYOP programs.

In addition to the PSY1-series reports that have been described above, statistical data can also be processed by using the Online Data Processing System (ODPS) available to users of the FMA system. A variety of data processing routines, such as histograms, line graphs, trend analysis, and tabular reports, are available at NMCSSC. Also, special processing can be requested in order to use data contained in FMA computer records concerning a particular inference or hypothesis. (See figure 15-4 for a schematic of the FMA system.)

PSYOP EFFECTS ANALYSIS SYSTEM (PEAS)

The PSYOP Effects Analysis System is designed to collect and process data on a target audience to measure the impact or effect of US and allied PSYOP. In addition, PEAS will store and process data about friendly and hostile PSYOP activities and actions. Figure 15-5 presents the relationship of the PEAS with the PFAD and FMA Systems.

Data Worksheets

Data worksheets are used to collect and organize the data in accordance with an 80-column punch card format. Data are organized in PEAS by:

Units or activities responsible for initiating US/allied propaganda and PSYOP activities.

Units or activities delivering or disseminating US/allied PSYOP messages and actions.

Military intelligence, civilian, PSYOP, and other interrogators.

Units or activities responsible for monitoring hostile propaganda and actions.

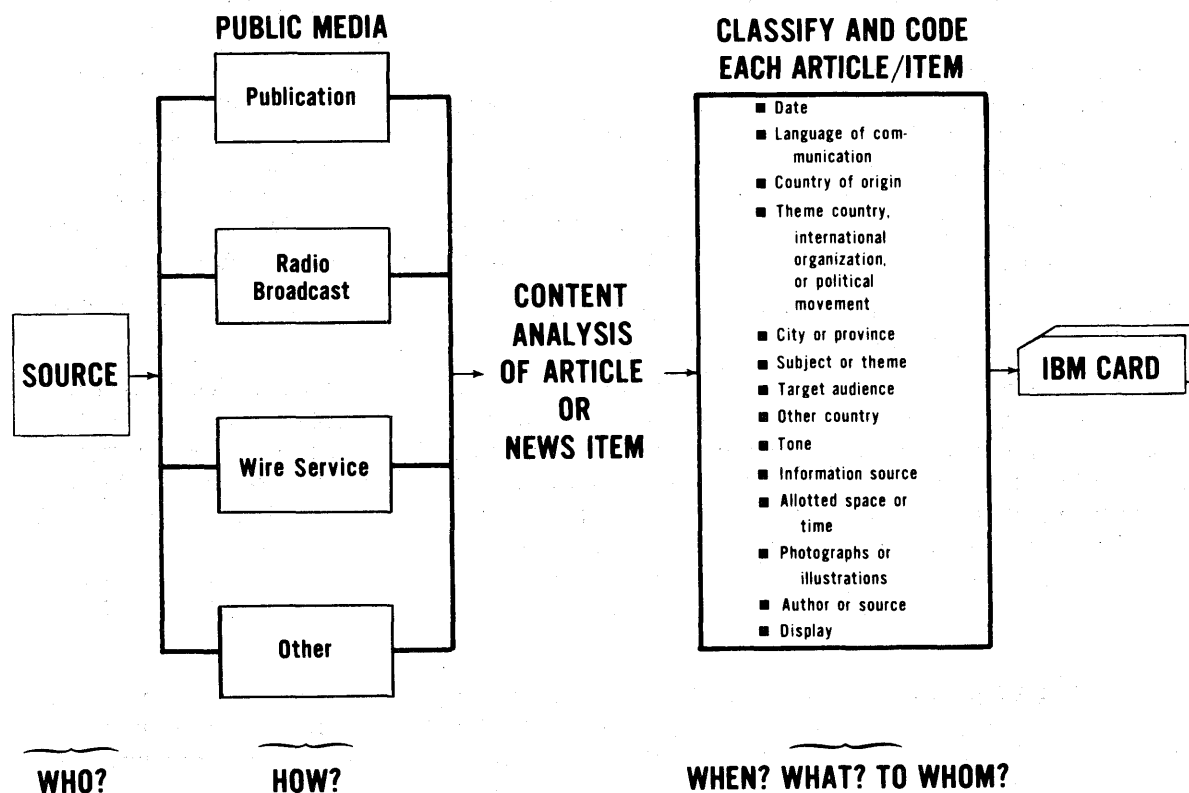

PEAS Worksheets

The PEAS worksheets have been designed so they can be completed in two stages:

Initial data collection by non-PAMIS-trained personnel.

Coding by personnel trained in PEAS methodology and coding conventions.

The data are compiled by answering a series of questions on appropriate worksheets. The worksheets are then sent to a PSYOP unit for insertion of punch card transcript data codes, verification of data, preparation of data cards, and submission to an electronic data processing (EDP) support facility for processing and storage.

Who says what, how, to whom, under what circumstances, for what purpose, and with what effect?

FIGURE 15-4

THE FMA APPROACH TO CONTENT ANALYSIS

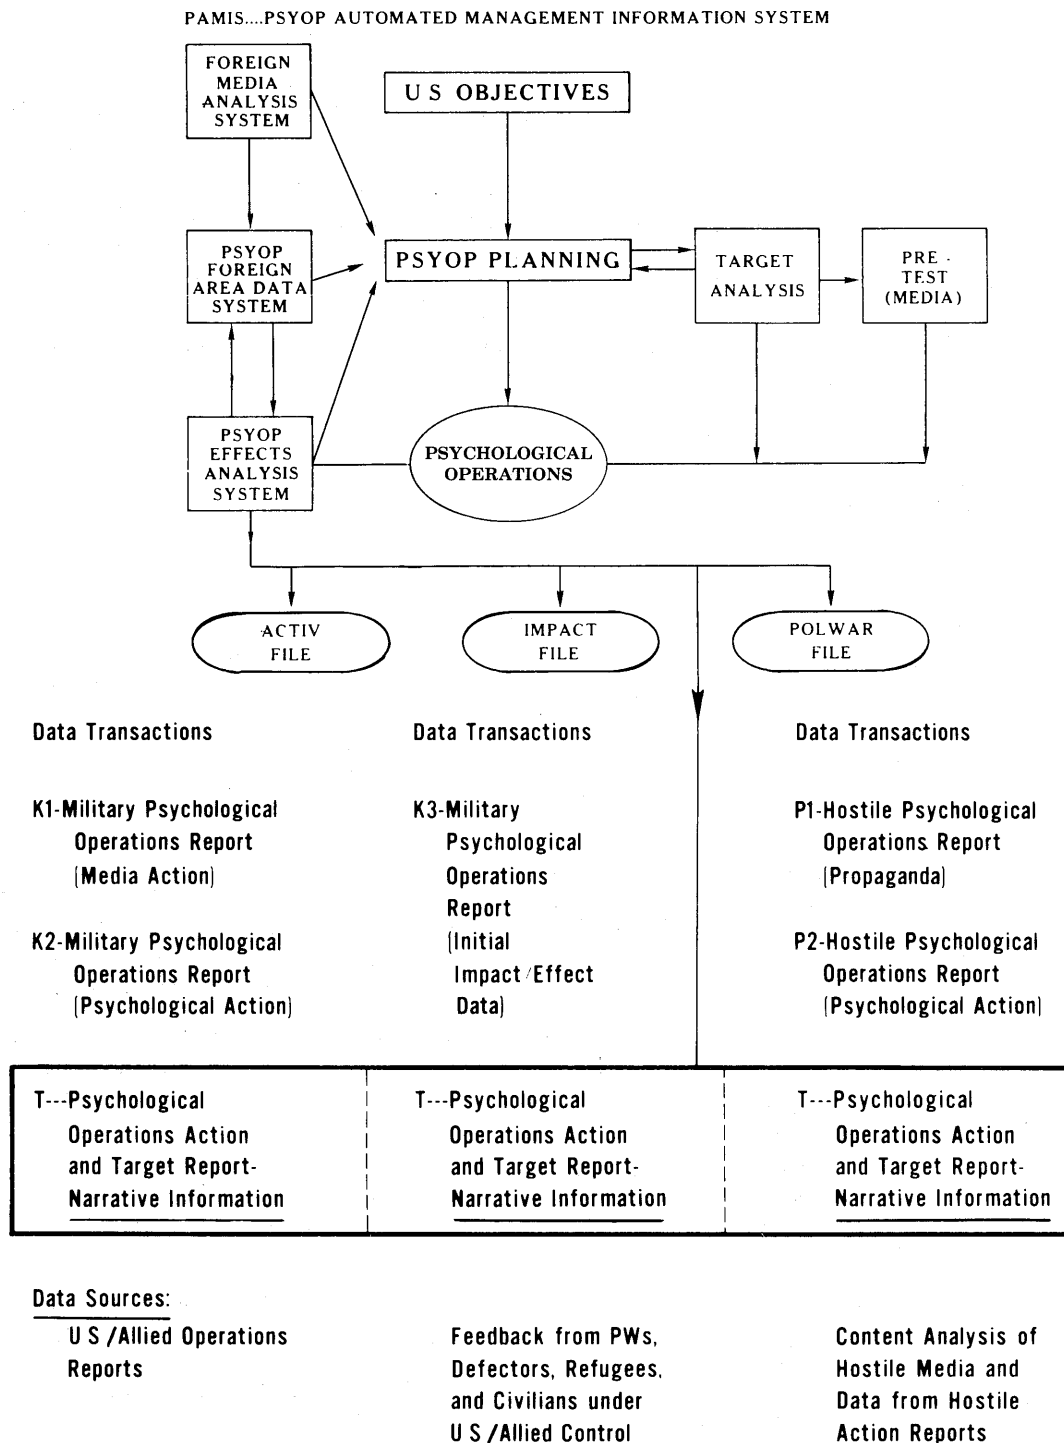

FIGURE 15-5
RELATIONSHIP OF PSYOP EFFECTS ANALYSIS
SYSTEM WITH PFAD AND FMA SYSTEMS

Storage and Retrieval

Following validation, transaction cards are converted into a format suitable for digital storage and retrieval and stored on one of several PEAS data files. (See figure 15-5.)

File ACTIV (Activities). Data from this file provides information about the effort devoted to the various mass media channels and other methods of communication. Information about other types of action is also available; i.e., those that are designed primarily for psychological effect, such as show of force, supply drops, medical relief, etc. File ACTIV also provides PSYOP commanders with uniform procedures and methods for reporting and analyzing US and friendly PSYOP activities. It provides data on the effort supporting:

- Specific campaigns.
- Various PSYOP objectives and tasks.
- Propaganda themes.
- Target groups.
- Military units and civilian agencies.

PEAS Impact File. The PEAS Impact File provides PSYOP commanders, target analysts, and others with systematically collected feedback about US and allied propaganda messages and PSYOP actions. Data collected for the Impact File is only one element in determining the overall effect of PSYOP. It does not replace the collection of data about propaganda messages from panels or data collected by means of in-depth interrogations.

Use of PEAS Worksheets (Impact Data Records). The PEAS data collection format is useful for prisoners-of-war interrogations at the brigade and division levels of command. Each PEAS impact record pertains to a respondent's reaction to an electronic or printed PSYOP message. In the interrogation process, the respondent is required to select or identify the PSYOP message(s) that he has seen or heard.

PEAS impact data messages (worksheets) are then completed for those US/allied propaganda messages identified by the prisoner or other respondent. A combination of casual statistical data and clear-text narrative information is used to evaluate the impact of PSYOP campaigns, objectives, tasks, and themes. The PEAS computer program can correlate that portion of the PSYOP record containing effect data with information about target groups, PSYOP objectives/tasks, PSYOP themes, and other actions. These data should provide commanders with indicators about the success or failure of military PSYOP.

The PEAS POLWAR File. The POLWAR File of the PEA System provides uniform procedures and methods for reporting and analyzing hostile propaganda and actions directed at US and allied populations. Data from the file allows continuous monitoring of the hostile POLWAR at the tactical command level. This file of the PEAS interfaces with the Foreign Media Analysis System of PAMIS.

The POLWAR File is concerned with those communications and actions that take place in a combat environment. This contrasts with the FMA System whose interest is primarily strategic and is concerned with those media directed to the domestic audience. The operational objectives of the POLWAR data file are to:

Pinpoint those military units that are the target of hostile propaganda and psychological actions.

Highlight and quantify enemy propaganda objectives, tasks, and themes.

Highlight enemy propaganda to friendly ethnic groups and other special targets.

Provide indicators of the impact of hostile PSYOP on US and allied military populations.

In addition, a systematic analysis of hostile POLWAR activities provides valuable clues concerning the impact of our own PSYOP programs on the enemy. Standard practices and operating procedures should be established by the theater commander to monitor hostile propaganda and to collect data. An 80-column punch card format is used to collect and organize the POLWAR data. It can be completed by military PSYOP teams, military intelligence, radio monitoring teams, special police, national information agencies, and others.

*Chapter Sixteen***PROPAGANDA ANALYSIS**

The psychological operator uses propaganda analysis to:

- Reveal opportunities for PSYOP exploitation.
- Assess the effects of enemy and friendly propaganda.
- Collect intelligence related to PSYOP.
- Obtain intelligence for other uses.
- Supplement other intelligence.

**CONTENTS**

	PAGE
Tools of the Analyst	16-2
Scope of Propaganda Analysis	16-3
Methods and Procedures	16-3

16

TOOLS OF THE ANALYST

The propaganda analyst works primarily with foreign mass communications that attempt to influence the conduct, attitudes, opinions, and emotions of groups. A foreign country's daily output of official printed media, radio and television broadcasts, and wire service releases provides the greater portion of material. This material assists in analyzing:

Morale.

The level of morale of a nation may be determined by its domestic propaganda. For example, domestic propaganda quietly and unemotionally delivered generally reflects high morale, while silence, bluster, or strident propaganda suggests low morale.

Involuntary Information.

Propaganda may contain news, opinions, and entertainment. Valuable information can be obtained from a careful analysis of this material. For example, the space a government gives to its leaders in its propaganda is often a measure of the relative power of individuals within the hierarchy.

Biographic Information.

Events may provide biographical information on particular individuals. For example, the presence of a new personality at a publicized ceremony may indicate a shift in the power position of that person.

Economic Data.

Economic information may be derived from statistics reported in propaganda, even if the statistics are false. Comparisons with previous data often give valuable clues about industrial or agricultural output, manpower shortages, or other economic conditions.

Propaganda Inconsistencies.

Any inconsistency in propaganda may provide insight into conditions in the source's homeland, including the condition of its combat forces.

Intentions.

Propaganda may be used to conceal the real intentions of the source. An example is an attempt to convey the impression that any future outbreak of hostilities will be the fault of the other nation.

SCOPE OF PROPAGANDA ANALYSIS

Propaganda analysis is the detailed examination of the source, content, audience, media, and effects of propaganda. Propaganda analysis permits the analyst to arrive at valid conclusions that will result in effective PSYOP campaigns. These elements are interrelated and cannot be analyzed independently. In short, propaganda analysis provides answers to the basic questions: WHO says WHAT, to WHOM, in WHAT MANNER, for WHAT REASON, and with WHAT EFFECT.

A word of caution: To distinguish minor, transient themes from those that are basic (major) and continuing, the analyst must collect sufficient information over an extended period of time.

METHODS AND PROCEDURES

The first step in the propaganda analysis process is to analyze the communication system. At the basic level, a communication model consists of a source, message, and destination. The relationship of the items for analysis (source, content, media, audience, effects) to the basic elements of the communication system (source, message, destination) are illustrated in figure 16-1.

COMMUNICATION ELEMENT	SOURCE	MESSAGE	DESTINATION
COMPONENT OF PROPAGANDA ANALYSIS (ANALYTIC FUNCTION)	SOURCE ANALYSIS	CONTENT ANALYSIS MEDIA ANALYSIS	AUDIENCE ANALYSIS EFFECTS ANALYSIS

FIGURE 16-1

RELATION OF COMPONENTS OF PROPAGANDA
ANALYSIS (ANALYTIC FUNCTIONS) TO
COMMUNICATION MODEL ELEMENTS

Each type of analysis (source, content, audience, media, effects) has its own procedure. For example, when the audience is accessible, it is possible to analyze effects by the use of personal (structured) interviews and questionnaires. If not accessible, less direct procedures must be employed. On the other hand, source and audience analyses are more dependent on specific information about the source and the target audience than on procedures.

Once the universe of communications has been defined and the analytical categories selected, quantitative analysis can be performed. This is done by counting the number of entries in each analytical category from each unit of analysis of the media. Statistical comparisons and analyses can be performed from these counting operations. Qualitative or interpretive analysis is required to illuminate or supplement these quantitative findings.

Source analysis. The source is the individual or organization sponsoring the development and dissemination of the propaganda. Analysis of the source gives the analyst an understanding of the credibility of the source and its proximity to the center of government, military command, and other important persons.

Actor and authority.

Actor refers to the persons or entity apparently initiating the propaganda. Authority, on the other hand, refers to the person or entity in whose name a statement is made. Sometimes the actor and the authority are the same.

Author.

One of the major reasons to analyze propaganda is to establish authorship--to determine where in the spectrum of power the propaganda originates. The author and authority may be the same, especially if the author is well known to the target audience; e.g., Winston Churchill.

Content analysis. Content analysis, the most important element of propaganda analysis, depends on sound analytical methods and reliable, accurate information. It is the analysis and evaluation of statements to determine the motives and objectives of the source. It reveals the meaning and reasons why the message(s) was disseminated. Because content (what is said) is the major element of communications, content analysis constitutes the major effort of propaganda analysis. Direct access to the target audience is not required.

Procedures for content analysis range from the application of objective, quantitative techniques to the application of entirely subjective techniques. Objective techniques systematically analyze content over a period of time by classification systems and statistical tables.

Subjective content analysis is based on the background, "gut feeling," and judgment of the analyst.

A combination of both methods is required for a valid product; statistics, equations, and tables must be interpreted.

How it's done:

STEP 1

An assumption (hypothesis):

Whichever approach is taken (objective, subjective, or a combination), the first step is to set up an assumption (hypothesis) to be proved or disproved. The hypothesis is actually an educated guess as to what the analyst believes to be the motive for some psychological action or propaganda message. It may be necessary to change the hypothesis as the analysis develops. In some cases it may be necessary to repeat the entire process.

STEP 2

Sampling:

The next step is to decide which specific items to examine for content. The analyst will seldom have free access to all the propaganda produced by a source, so he must take samples of the source's propaganda. The sample must be large enough to provide an accurate indication of the propaganda produced. It must also be representative, having the characteristics of the propaganda output. Sampling for content analysis involves the following operations:

The analyst must determine which communications (publications, commentary, etc.) to examine--which newspapers, which magazines, which radio or TV stations.

Having decided which titles he will examine, the analyst must next decide which issues he will analyze. For example, having decided to examine a particular newspaper, he must decide which issues--Monday? Tuesday? etc.

Having made these decisions, the analyst must decide what part of the publication or broadcast he will examine--the front page? editorials? evening newscasts? etc.

Next the analyst determines the unit of analysis for counting the content elements. The original assumption will help to determine which are appropriate. Major units of measure are:

Words. The word is the unit of analysis. Use of this unit results in a list of relative frequencies of selected words.

Phrases. A variation of the word is the phrase. Phrases generally fall into the categories of cliches, idioms, or slogans.

Sentences. This category is an extension of phrases.

Topics and themes. Topics are appropriate when only the subject matter is considered without any embellishment by value judgments. Lists of topics can be prepared without any reference to actual propaganda content. Themes are more appropriate when the subject matter and the value judgments (positive or negative) associated with the subject matter are addressed. Themes tend to be derived more from the actual content than do topics. **A theme implies a topic, but a topic does not necessarily imply a theme.**

Examples:**TOPIC****THEMES**

Military maneuvers

The unbeatable
division

Farm production

Five percent feeds
the world

The farmer

The backbone of
the country

Item. An item is a complete unit of a medium devoted to a specific subject. The item will differ according to the medium used. It may be a news story, an editorial, a magazine, a book, a radio or TV program, or any other complete, self-contained expression of ideas. Items are convenient units when using broad, general content categories covering a large range of subjects over a relatively long period of time.

Space-Time Units

Number of lines, paragraphs, pages, chapters, square centimeters.

Column inch.

Footage (film or videotape). This translates to time measure (minutes).

Minutes; e.g., broadcast time (loudspeaker, radio).

When using units of count or measure, more than one unit can be used for any given analysis. The purpose of the analysis determines the units to be used.

STEP 3**Basis for classification:**

The next step is to consider the characteristics of propaganda messages that can be used for classification or category formulation. Message content may be broken down into two major categories: what is said and how it is said.

On the basis of what is said, the following breakdown is appropriate.

Subject matter.

Most information is classified on the basis of subject matter.

PAMIS FMA.

The PAMIS Foreign Media Analysis System categorizes propaganda on the basis of subject matter (among other categories).

Values of the message originator as reflected in content.

Values are the ideals and goals of a society or other group; they affect the behavior of members of that society or group. Themes such as "freedom of

speech," "freedom of religion," and "freedom of press" are examples of content categories which represent values.

Direction--pro or con.

Propagandists are either for or against something. This is apparent in the content of their propaganda. The directional approach (pro or con) may be combined with the subject matter category, or it can be used alone. In this approach, the subject matter is indicated and judgments are made as to how the subject matter was treated by the propagandist; i.e., positively, neutrally, negatively.

Regionalism.

Propaganda may be classified on the basis of its geographic origin (regionalism). This classification and analysis depend upon the ability to monitor regional publications and broadcasts. The emphasis is on associating subject matter and its treatment with geographic areas.

On the basis of how a message is stated, the following categories may be used.

Form or type of communication.

Forms or types in newspapers include editorials, news, features, comment, letters to the editor, fiction, etc. Radio and TV content may be classified as music, news, commentary, special features, drama, variety, and talk.

Form of statement.

Much propaganda consists of arguments or appeals; i.e., a conclusion with supporting rationale.

Intensity.

From the strength of an appeal or argument, an analyst might determine the potential impact on audiences as well as how strongly the source feels about a specific issue. One technique is to measure intensity involved by identifying emotion-laden terminology, classifying the expressions in terms of direction (i.e., positive, neutral, negative), and counting the frequency of such terms.

Propaganda tricks of the trade.

In those instances when the logic of an argument or appeal is weak, propagandists revert to techniques known as tricks of the trade. These techniques may also be used to bolster valid arguments and appeals. In many cases, certain techniques may be used to address specific target groups or subject matter areas. A good reason for analyzing tricks of the trade is that they may give the first indication that the material being analyzed is propaganda. (See appendix I for more complete coverage of tricks of the trade.)

Language used.

The language and dialects used, the most obvious features of propaganda, are the best indicators of the intended target audience and its characteristics.

Mode (as a reflection of intent or purpose).

A particular manner or style can sometimes be used as a basis for classifying propaganda output. Four possible categories (others may also be used) might be image enhancement, image destruction, persuasive, and threatening.

As in all intelligence analyses, the results must be presented to the users. Normally, a tabular chart indicating totals for each category for each period of time would be used to permit comparison of coverage. These totals can be converted into charts, bar or pie graphs, etc. In the case of pure qualitative content analysis, the results are primarily word pictures based on impressions rather than numbers.

STEP 4

Analysis of results:

The analyst takes the results of his study and examines them in the light of his hypothesis. Using quantitative content analysis techniques, the analyst reviews any charts or graphs depicting the final results of the count and decides whether the hypothesis (original assumption) is supported or not. By this means the analyst determines trends in a time series and relative emphasis in comparative studies, depending upon the hypothesis.

STEP 5

Final inference:

The final step, based on the proof or lack of proof of the hypothesis, is drawing the inference which can be used by the analyst to reach useful conclusions on current conditions or future actions.

Audience analysis. Audience analysis is the study of the total audience that the propaganda reaches or seeks to reach. An audience may include those persons who were not the intended target for propaganda but who have received the message. Audiences may range from a highly general category, such as the Russian people, to a specific category, such as a rifle company. They may be defined as specific groups in terms of income, nationality, geography, ethnic, political, religious, social, economic, classes or castes, etc.

Should propaganda content be classified according to audience, decisions must be made as to whether the apparent or inferred audience (or both) should be considered. In case of inferred audience, stringent specific criteria must be spelled out for making the inference. Tables and matrixes may be constructed to make the analysis more valuable.

Media analysis. The analyst is interested in the specific medium used, why a particular medium was chosen, what media capabilities an adversary has, and how consistent the message content is in the various media.

A minimum requirement for message effectiveness is that it be received and perceived by the intended recipient. The sensory mechanisms required to perceive a message are used as the most fundamental classification of media. Briefly, messages can be perceived visually, aurally, or aurally and visually. The breakdown of receptor mechanisms and corresponding media are as follows:

VISUAL	AUDIO	AUDIOVISUAL
Books Magazines Pamphlets Leaflets Posters Handbills Calendars Novelties Photographs Newspapers Signs (fixed and mobile) Banners	Radio Loudspeakers (carrying live or prerecorded messages)	Sound motion pictures Tape and slide combinations Cassette and filmstrip combinations Television Activities (e.g., military civic actions, show of force, rallies, demonstrations) Interpersonal (face-to-face communications)

Periodicity.

Time or periodical patterns of operation can be used as a basis for classification. Printed media are generally classified according to their periodicity; e.g., daily, weekly, biweekly, monthly, etc. Radio and television programs can be classified on the basis of their broadcast times within a broadcast day or on other time schedules; e.g., a daily feature, a weekly feature, a morning or evening feature, and a feature at 1800 hours, etc.

Placement of content.

The physical position or placement of content within a medium may be used as a basis for classification. Printed material might be classified as lead stories, cover stories, center spreads, front page news, etc.

Place of origin.

Sometimes origin is openly acknowledged, and other times it must be inferred. The origin of radio and television broadcasts may be established by direction-finding techniques. The precise source of material contained in other media may be more difficult to pinpoint.

Technical characteristics.

Radio and television broadcasts can be classified on the basis of the frequencies or channels employed, modulation, and the strength of the signal (the likely power at which the signal was transmitted).

Printed material (also signals) can be classified on the basis of methods used to reproduce the material. The number of pages, quality of paper, and typography might be used as a basis for classification.

Printed media and television may also be classified on the basis of color or black and white.

Media are sometimes linked with delivery systems, which also serve as a basis for classification. For example, loudspeakers can be stationary, hand-carried, truck-mounted, tank-mounted, or aircraft-mounted. Leaflets may be delivered by fixed or rotary-wing aircraft, balloons, sea floats, artillery, bombs, and mines, or they may be disseminated by hand.

Mode of transmission.

Media can be classified as overt or covert. Covert transmission would include surreptitiously delivered leaflets, handbills, posters, and broadcasts from clandestine radio stations.

Acknowledgement by source.

The extent to which a source acknowledges its output may be used as a basis for classifying media (and content). White, gray, and black propaganda fall within this classification category.

Legal status of disseminator.

By international convention, countries broadcast on assigned frequencies and power output. Not all broadcast facilities adhere to this convention. Thus, broadcast stations can be classified on the basis of their registration and the extent to which they adhere to regulations. Some clandestine stations are clandestine only because they do not adhere to international broadcast codes.

Some indicators of problem areas.

Supply shortages may be indicated by poor grades of ink or paper used in the source's printed propaganda. Weak radio signals, interrupted programs, poor program production, or a lack of operating stations suggest a lack of signal equipment, facilities, supplies, and trained personnel.

Effects analysis. In analyzing hostile and friendly propaganda effects, the analyst attempts to determine the effect of the source's propaganda upon the target audience and the reasons why it was effective, partially effective, or totally ineffective. Four general types of evidence help to ascertain if propaganda has or has not been effective. These are responsive action, participant reports, observer commentaries, and indirect indicators.

Responsive action is behavior which can be more plausibly attributed to propaganda than to any other stimuli in the environment of the target audience. In the ideal case, a one-to-one ratio can be established; e.g., immediate surrender of troops precisely as directed by a combat loudspeaker broadcast. Rarely, however, can responsive action be attributed to propaganda appeals alone; often the appeal, at best, has crystalized an existing tendency for action.

Participant reports are accounts received from members of the target audience on how they were affected by the propaganda. These reports may be emotion laden and are less reliable evidence than responsive action; they may not truly reflect the individual's response. In accessible areas, participant reports are valuable because a great variety of participants can be asked how they felt about the propaganda.

Observer commentaries are reports by witnesses to a situation in which they were not involved. Depending upon the perceptiveness of the observer, his assessment of the situation may or may not be accurate. Information from observers may be taken at face value. Observer commentaries may be taken from such persons as agents stationed within the target area, PWs, escapees, defectors, reporters, businessmen temporarily in the area, etc.

Indirect indicators are the events that occur in the area of operations and appear to result from PSYOP although not directly suggested by PSYOP. Indirect indicators fall into four major categories:

Physical actions barring reception. These are actions taken by the enemy to prevent the audience from receiving external communications. Barring of entry of printed material and jamming of radio stations are examples.

Psychological conditioning. A government or military commander might initiate actions which, while not physically preventing reception of external communications, are designed to cause the audience to avoid them. For example, the government or military commander might try to convince the audience that the source cannot be believed, or harsh penalties might be enforced for listening to, viewing, or reading communications from external sources.

Persuasive efforts. If the audience did receive the communication in spite of the efforts of its government or command, a counterpropaganda program might be initiated. Content analysis could reveal this effort.

Apparent related events. Events may occur that can logically be inferred to be associated with the psychological operations or propaganda although they were suggested. Before these events can be accepted as indirect indicators, all causative external factors other than propaganda must be accounted for.

Several techniques are available to analyze the relative effectiveness of US Army propaganda campaigns. These often indicate effective and ineffective themes and the principal concerns of specific audiences.

Public opinion polls, if properly used, present a fairly reliable index of propaganda effectiveness. Do not assume, however, that the results of polls precisely mirror the views of the people.

Prisoner-of-war interrogations and surveys can furnish valuable data regarding US Army propaganda effectiveness. Selected prisoners should be given specific written or oral questions regarding themes, format, color, appropriateness, programing, location where seen or heard, steps taken by recipients, actions taken by local authorities, and other feedback information to be used to improve the overall program.

Prisoner-of-war panels are valuable in determining propaganda effectiveness. A planned message is presented to the panel, and members are questioned as to the credibility or validity of the message. Weak propaganda may be detected and corrected

before it is used. The panel may point out poorly composed propaganda messages caused by a lack of full understanding of enemy psychology, terminology, and customs. This technique may suggest ways to strengthen particular themes into account previously unknown factors.

Other sampling techniques may be employed. One technique involves sampling of opinion leaders; i.e., those persons whose positions enable them to influence public opinion. This technique is particularly useful in occupied areas. Analysis of personal letters and captured personal documents is often rewarding because the writers usually express their true sentiments regarding their immediate environment, conditions at home, enemy propaganda techniques, and other pertinent factors.

Disintegration of enemy groups suggests low morale. An enemy group which was subjected to intensive propaganda attack and which is now disintegrating may provide clues to the effectiveness of propaganda operations. The number of enemy soldiers who surrender is generally not an accurate measure of propaganda effectiveness because of the many factors involved which actually induce surrender.

Current information on enemy morale--number of defections, increase in political arrests, strikes, mutiny, etc., as determined from PW reports, monitored radio reports, and other information--should be used by the psychological operator.

Chapter Seventeen

17

FACE-TO-FACE/AUDIOVISUAL/ VISUAL/AUDIO COMMUNICATIONS

Media are categorized by methods of dissemination: face-to-face (interpersonal), audiovisual, audio, and visual.

Team IC, Mobile Radio Engineer (Radio Transmission)	17-16

Face-to-face (interpersonal) communication is the most effective means of transmitting a persuasive message. It is employed in rallies, rumor campaigns, group discussions, lectures, show-and-tell demonstrations, social organizations, social activities, entertainment, and individual person-to-person contact, all providing a participating experience for the individual or group to recall later.

Audiovisual media such as television, electronic tape recordings, and sound motion pictures are the second most effective means of communication available to the psychological operator. Effectiveness is based on seeing and hearing the persuasive message. These media are an excellent means of transmitting persuasive messages and eliciting a high degree of recall.

Audio media (loudspeakers and radio) lend themselves to the transmission of brief, simple messages and to personalization by use of the human voice. They require little or no effort by the audience, and generally, they have more appeal than visual media. Also, the barrier of illiteracy may be more easily overcome with audio media than with visual media (printed material).

Visual media can transmit long, complex material. Animated or still cartoons may be used to convey themes to illiterate and preliterate target audiences. Visual media generally have the least amount of popular appeal.

Themes are reinforced and the target audience given broad coverage by using several media to deliver the same basic message. For example, radio and television can augment leaflets; face-to-face communication can support newspaper circulation.

CRITERIA FOR SELECTION OF MEDIA

Acceptability and credibility.

A complete target analysis will indicate how acceptable and credible a particular medium is to the target audience.

Availability.

The availability of media, the mechanical capability of message production, and the capability to deliver the message, as well as the ability of the audience to receive and understand it are important.

Timeliness.

Production and dissemination lag for each medium must be considered. For example, a medium requiring a long production or dissemination time would not be suitable for a message exploiting a target of opportunity.

Quantity.

The media selected should be mixed, one medium reinforcing the other, and delivered in sufficient volume to insure that the entire target is exposed to the message. Care, however, is required to prevent counterproductive oversaturation of the target audience. This requires analysis of intensity and timing of propaganda dissemination.

Themes.

The theme to be conveyed will have a bearing on the selection of the best media to transmit the message.

Suitability.

The media selected must be suitable for the target. The language selected, vocabulary, and level are also important factors. For example, it would not be appropriate to use newspapers or other printed text to deliver a message to an illiterate audience. A professional journal might be the most suitable means of reaching a professional audience.

CATALOGING

PSYOP units should prepare catalogs of media material which applies to recurring themes and general audiences. These catalogs should include printed material, loudspeaker and video tapes, motion picture films, and specialty items available to PSYOP.

FACE-TO-FACE COMMUNICATION

Face-to-face communication ranges from two or more individuals in informal conversation to planned persuasion among groups. The credibility of the PSYOP messages delivered by face-to-face (interpersonal) communication is increased when the communicator is known and respected.

Advantages

Relationship	It employs an interpersonal relationship.
Audience selection	The audience can be deliberately selected and the appeal directed and tailored for it.
Assessment of impact	Feedback is immediate. The communicator can immediately assess the impact of his message and adjust his approach to obtain the desired response.
Limited support required	Limited technical and logistical support are required.
More credible	It can be more credible than other methods because the target audience can evaluate the source.

Presentation	Complex material can be presented in detail. Frequent repetition and slight variations can be readily used to influence the audience.
Expeditious	In some instances, particularly in primitive areas, it may be the most expeditious method of disseminating propaganda.

Disadvantages

Limited use in tactical situations	Use is limited in general war due to the inaccessibility of the target individual or group. It has limited use in tactical combat since the psychological operator has little face-to-face communication with opposing forces until they are captured or defect.
Close control necessary	It must be controlled, especially at the lowest levels where each communicator has the responsibility to interpret policy and objectives. The control factor is best illustrated by trying to pass an oral message, one person at a time, throughout a group. By the time the message reaches the end of the group, it does not resemble the original message. Reinforcement by other media is necessary to eliminate this problem.
Limited by insecure areas	Security considerations limit the conduct of face-to-face communications. As the security situation improves and more areas are secure, area coverage can be extended.
Requires able communicators	It requires knowledgeable, orally persuasive individuals who can convince the target audience that the program and policies are irresistible and inevitable.
Normally require indigenous personnel	For effective communications, indigenous personnel are normally required.
Range of voice limited	The range of the human voice and the need for visual contact limit this method to relatively small audiences.

TELEVISION

Television, including video tape recording (VTR), is one of the most effective media for persuasion. It offers many advantages for PSYOP, and its wide application in other fields contributes to its acceptance and use. It is appropriate for use in limited, general, and cold war and is particularly effective in FID and consolidation operations.

In places where television is not a common communication medium, receivers may be distributed to public facilities and selected individuals. A possible limitation in enemy countries, however, is that television receivers may be set to allow reception on only one or two channels under government control.

Television is an all encompassing-mass communication medium. Like radio, it makes use of the sense of hearing to convey an idea. Like printed material, it makes use of the sense of sight, adding the element of motion. And like the motion picture, it combines sight, sound, and motion. Television is immediate; in effect, it places the viewer in two locations simultaneously, creating the illusion of participating in a distant event.

Advantages

Speed	Television programs can reach large segments of the target audience rapidly. The transmission of events can be instantaneous.
Overcomes illiteracy	Illiteracy is not a barrier; an audience need not be able to read.
Unifies	Television brings people in widely separate locations closer together by exposing them visually to the same ideas and concepts.
Aural-visual	Television appeals to two senses, each reinforcing the other. This gives the viewer a sense of involvement.

Disadvantages

Range	Geography and atmospheric conditions affect the strength and range of the signal. The signal may, however, be boosted with relay stations, airborne transmitters, or satellite relay to increase the transmission range. Airborne antenna relay domes extend the range of a central transmitter but at great expense.
Reception	Television sets are unevenly distributed throughout the world. Messages disseminated by television will normally be received only by those within an above-average income range and economic class in many areas of the world, particularly in developing nations. In some developing nations, however, group listening/viewing centers may be available, negating the link between income and access to television. The association should be carefully determined for each target country. The fact that receivers in the target area may not be compatible with the transmission equipment is another disadvantage.
Power	Most television receivers require an outside source of electric power. Many areas of the world lack this power. The introduction of self-contained power packs partially eliminates this problem. If broadcasts are to be made from areas lacking power facilities, special generators and a fuel supply may be needed.

Vulnerability	<p>Equipment and parts are fragile and extremely vulnerable to damage.</p> <p>Stations are easily identified and make excellent targets.</p> <p>Receivers are difficult to hide.</p>
Program requirements	<p>A substantial production staff and supporting equipment are required to produce daily programs. Each day's operation requires a large amount of film, video tape, and live programming to sustain a program schedule.</p>
Maintenance	<p>Maintenance is highly technical, requiring trained and skilled technicians and engineers; such people are difficult to find.</p>
Personnel	<p>Television is a complicated communication medium, demanding specialized personnel with a wide range of scarce skills.</p>
Audience accessibility	<p>Although TV is excellent in friendly or neutral areas, it will not reach audiences in hostile areas unless a means is found to enter sets in these areas. Incompatibility of receivers, extreme distortions caused by two transmitters on the same wavelength, jamming, and censorship limit the use of TV broadcasts to hostile areas.</p> <p>Community viewing provides an opportunity to present TV programs which help the people identify with the sponsor (generally the established regime). If it is necessary to provide receivers, one technique is to place them initially in urban centers, extending them to rural areas as equipment and power become available; or vehicles equipped with power generators and TV sets may be moved into and out of areas as required.</p>

VIDEO TAPE

Video tape, an offshoot of television, is an excellent means of recording and projecting messages. It can replay a scene from the camera immediately after it is recorded. The tape can be used in either portable or studio recording systems, being processed electronically as it moves through the video tape recorder.

Although most commercial tape is 5 centimeters (2 inches) wide, the US Army primarily uses 1.875-centimeter (3/4-inch) cassette tape. The scenes from each size tape can be readily dubbed on to the other.

Advantages

The results of the "take" can be seen immediately; if editing is necessary prior to release to the audience, it can be done electronically as the material is being produced. There is no time lag as with film which requires chemical processing.

The tape can be reused a number of times, erasing itself as it is run through the recorder, or it can be quickly erased on equipment made for that purpose and then reused.

Video tape is virtually indestructible and can be used in almost any environment in which humans live.

The tape can be placed on readily available video cassette players which feed directly into commercial television receivers. With special equipment, video-taped scenes can be projected onto large motion picture viewing screens. The requirement for special projection equipment is not unique, as special equipment is also required to project filmed scenes on television screens.

Video tape can instantaneously project scenes in black and white or color, with natural or dubbed sound, on open (public) or closed (limited audience) circuits.

With the use of video tape, scenes may be recorded for a permanent record or for future use.

Disadvantages

The disadvantages of video tape are those inherent in the television medium.

MOTION PICTURES

Motion pictures combine many aspects of face-to-face communication and television by creating a visual and aural impact on the target audience. Since US Army PSYOP units are not able to produce motion pictures, appropriate films may be selected from available sources; effects on the target audience must be carefully considered.

Four general types of motion pictures are adaptable for psychological operations:

- | | |
|-----------------------|--|
| Entertainment. | These are standard commercial productions, including animated cartoons. Entertainment films developed specifically for propaganda purposes can be very effective as the themes may be woven into the plot of the movie. These films can be very effective in gaining attention for other propaganda. |
| Newsreels. | In the developing nations, newsreels are still a major attraction. They are on the scene and show exactly what is happening or, with good editing, give that impression. By careful, skilled editing and arrangement of sequence, news events can be used as propaganda. |
| Documentary. | This type of film--ostensibly an objective presentation of a scene, place, condition of life, or a social or political problem--is a prime |

means of propagandizing a target audience. This is done by careful selection and sequencing of scenes and events.

Training films.

Themes can be hidden in the presentation. A number of US Government-produced films are available for use by the military psychological operator. They must, however, be selected with care, as many exploit particular situations and viewpoints in a biased manner.

Advantages

Themes and objectives may be dramatized to create realism. The dramatic quality tends to cause the viewer to identify with the characters being portrayed. Thus, skillful application of production and editing techniques, such as having a central character act the behavioral patterns desired, can be very effective. The tendency to identify with the actors aids in developing a high degree of audience involvement in the PSYOP appeal.

Motion pictures gain attention, especially among illiterate groups, as illiteracy is not a barrier to understanding and use.

Most children and a high percentage of adults accept without question presumably factual information presented in films.

Sight, sound, and color reinforced by moving images elicit a high degree of interest and recall.

The motion picture is a universal communications medium, combining audiovisual features, mass distribution, and ease of presentation.

Complicated events or complex ideas can be thoroughly explained. Cartoons and other special effects can be particularly effective.

Scenes can be rehearsed and perfected prior to filming.

Newsreels that show events known to the target audience enhance the credibility of the entire PSYOP program.

Motion pictures can be rerun.

Disadvantages

The production of high-quality motion pictures is extremely expensive and requires skilled technical production personnel.

Relatively lengthy motion picture production time makes it difficult to capitalize on targets of opportunity.

Films are rapidly outdated by events, clothing, vehicles, equipment, location, or dialogue.

Viewing by target audiences may be restricted because of security considerations, local regulations, or equipment capabilities.

Diverse language differences are a major problem; these can, however, be partially overcome by use of subtitles.

Projection equipment requires electric power which may not always be available.

Film is fragile and extremely susceptible to changes in temperature and other climatic conditions.

LOUDSPEAKERS

Microphones and sound amplifying equipment transmit messages up to a distance of 800 meters. In a civilian setting loudspeakers are used to communicate with assembled groups and in localized street broadcasting. They effectively extend the range of face-to-face communications.

Loudspeakers are the most responsive medium that can be used to support tactical operations. Unsophisticated loudspeaker messages can be developed on the spot and delivered live in fast-moving situations. PSYOP loudspeaker broadcasts are usually prerecorded to insure accuracy. Occasionally, standard tapes are developed, mass produced, and distributed from the theater or national level.

Advantages

- Targets of opportunity can be exploited.

- Persuasive messages can be transmitted to the target as the situation changes.

- Loudspeakers can be an extension of face-to-face communication.

- The operator can pinpoint his target.

- The target audience can be illiterate.

- The loudspeaker can be used to undermine enemy morale.

- Operators can be easily and readily trained.

- PSYOP personnel can move to and operate anywhere a potential target audience is located.

- Large, powerful, fixed loudspeakers can broadcast messages considerable distances into enemy territory.

- Loudspeakers may be mounted on either wheeled or tracked vehicles.

- Loudspeaker systems can be mounted in either fixed or rotary-wing aircraft. This broadens the areas accessible for loudspeaker operations. Since both types of aircraft must operate at low altitudes for the message to be understood on the ground, the sophistication and intensity of the enemy air defense are prime considerations.

- Small portable loudspeaker systems may be backpacked by dismounted troops.

Disadvantages

- Range is limited by humidity, wind, precipitation, vegetation, terrain, and manmade structures.

- The enemy can readily take countermeasures; i.e., concentrate artillery or other weapons on loudspeaker personnel and equipment.

Messages may be forgotten and distorted with the passage of time.

PLANNING AND COORDINATION

Loudspeaker operations are conducted in coordination with and in support of tactical operations. The loudspeaker team leader must advise the commander of the supported unit as to the support the team can give. The team can then obtain essential operational information and coordinate security with the leader of the tactical unit.

For maximum results, loudspeaker messages in support of tactical operations must have shock effect. A tactical broadcast should be no longer than a few seconds, as prolonged broadcasting from a fixed position will draw indirect enemy fire. The message should be carefully prepared, so that each sentence constitutes a single, complete thought that will not be misunderstood. The key sentence should be short and repeated for emphasis.

The size of the target area, the character and loudness of competing sounds, the terrain, and climatic conditions (humidity, wind, temperature, etc.) affect reception of loudspeaker messages. Sound travels better at night in low temperature and humidity. In hilly or mountainous terrain, echoes may interfere with clear reception. Jungle and heavily vegetated areas absorb sound. Sounds projected over water or low-lying coastal plains travel great distances.

The announcer, generally indigenous to the operational area, must have idiomatic language fluency. Defectors may be used. They will know the current slang, topics of interest, and the problems of the enemy soldier. Their messages, however, must always be prerecorded and checked prior to being broadcast. The announcer must have—

- An intimate and detailed knowledge of the customs, folklore, and speech habits of the audience.

- The ability to adapt script and presentation to the changing situation.

- A vigorous, unemotional delivery.

- An understanding of the military situation and its implications.

Broadcasting messages from aircraft is an effective way to reach an otherwise inaccessible audience. Some general considerations are:

- The PSYOP unit is responsible for the premission briefing of the aircrew. This briefing covers target location, current intelligence, total time required over the target, the length of the message, and the number of repetitions desired.

- The loudspeaker message should be no longer than 20 seconds so that the entire message is audible to the audience.

- Rotary-wing aircraft use banks of speakers mounted either internally or externally on the aircraft. The most effective altitude for a hovering rotary-wing aircraft is between 900 and 1,200 meters (3,000 and 4,000 feet) above ground level (AGL). The banking or orbiting course is effective at altitudes from 600 to 900 meters (2,000-3,000 feet) AGL. The presence and capabilities of enemy ground fire will determine whether to use these patterns or whether to use aerial loudspeakers at all.

The US Air Force has primary responsibility for aerial loudspeaker operations from fixed-wing aircraft.

An adapter system has been developed that permits the connection of the airborne loudspeaker system with the intercommunications and radio system of the aircraft. This allows a signal received by the aircraft from a ground radio transmitter to be rebroadcast to the target audience. The use of this system permits a language-qualified speaker in a central location to support widely dispersed ground elements. The device can be connected to a tape recorder to record the message for future use.

RADIO

Radio broadcasts can be transmitted to local audiences, or across national boundaries, and behind enemy lines. Political boundaries or tactical situations may hinder radio broadcasts, but they are not complete barriers. Since radio can reach mass target audiences quickly, it is useful for all types of psychological operations. Where radio stations are not common and receivers rare or nonexistent, receivers may be airdropped or otherwise distributed to key communicators, public installations, and selected individuals. Public listener systems may also be set up.

Advantages

Speed	Radio programs can be quickly prepared for broadcast. This is important when attempting to capitalize on targets of opportunity.
Wide coverage	Radio programs can reach members of large and varied audiences simultaneously.
Ease of perception	It requires little or no effort to visualize the radio message. Illiteracy does not prevent the listener from forming his individual image as he listens.
Versatility	Radio is easily adaptable to drama, music, news, and other types of programs.
Emotional power	A skilled radio announcer can exert tremendous influence on the listener simply with pitch, resonance, inflection, or timing.
Availability of receivers	Where availability or ownership of receivers is common, listening to radio is a habit. Ownership of receivers has increased greatly with the invention of transistors.

Disadvantages

Enemy restrictions	The target group may be subjected to severe censorship, thereby reducing the effectiveness of radio broadcasts. Some countries have only single channel radios with the frequency set to the government-owned station.
---------------------------	---

	In some areas central receivers are connected to household receivers to control listening.
Jamming	Jamming may prevent the target group from receiving radio broadcasts.
Technical	Signal may be made inaudible or distorted by fading or static due to unfavorable atmospheric conditions.
Lack of receivers	In certain areas, so few receivers are available that radio may not be an effective medium.
Fleeting impressions	Oral media do not have the permanency of written media. Messages may be quickly forgotten or distorted.

PROGRAMING

Radio programing consists of planning the schedule, content, and production of programs during a stated period. Words, music, and sound effects are put together in various ways to produce the different kinds of programs. Some of the major types of radio programs are:

Straight news reports (without commentary).

Musical (popular, folk, classical).

Drama.

Speeches, talks, discussions.

Sports.

Interviews.

Special events; i.e., on-the-spot coverage of an election or the arrival of an important visitor, etc.

Religious.

Variety, a combination including music, skits, comedy, vaudeville, etc.

Announcements.

PRINCIPLES

Regularity	Regularity is an essential element of programing. The radio programmer must create habitual program patterns in order to build a regular audience. Content, style, and format should follow an established pattern.
Repetition	Repetition is necessary for oral learning; therefore, key themes, phrases, or slogans should be repeated.
Suitability	The radio program must suit the taste and needs of the audience. Program style and format should follow the patterns to which the audience is accustomed.

Exploitation of censorship	Discussion or presentation of banned books, plays, music, and political topics is readily received by the audience. The same is true for news withheld by censors. In breaking censorship, the psychological operator must be certain that the reason for censoring the items was political and not moral.
Voice	<p>Having announcers with attractive voice features is essential to successful radio operations.</p> <p>The emotional tone conveyed by the voice may influence the listener more than the logic of arguments.</p> <p>Announcers whose accents are similar to those of unpopular groups should not be used.</p> <p>Female voices are used to exploit nostalgia, sex frustration, or to attract female audiences. However, in some parts of the world, due to the status of women, female voices are resented.</p>

CLASSIFICATION

Programs are classified according to content, intent, and origin.

Content	The most common and useful radio program classification is by content. News reporting, commentaries, announcements, educational or informative documentaries, music, interviews, discussions, religious programs, drama, and women's programs are the most common examples.
Intent	<p>Classification by "intent" is useful in planning to obtain a desired response with a particular broadcast(s).</p> <p>Programs are produced to induce such emotional reactions as confidence, hope, fear, nostalgia, frustration, etc.</p>
Origin	Classification by "origin" pertains to the source of the message; i.e., official, unofficial, authoritative, high military command, political party, etc.

FORMAT

Format is the arrangement of the various segments of a program. A fundamental principle in preparing scripts for broadcasting is to standardize as much as possible without losing flexibility. A standard or familiar manner of presentation identifies a program for the viewers, helping to gain a regular audience. The format for a series of programs is usually established before the first program is broadcast. Radio station personnel, when establishing the format, should bear in mind that they must adhere to the highest professional standards of scriptwriting.

PROGRAM BUILDING

The essential factors of program building are:

Purpose

The writer's first concern is the purpose of the program. What is it to accomplish? Careful construction of the purpose statement of the program will aid in structuring the program and provide a measuring device to determine if the goals are being met.

A credible program requires extensive research. Thorough research of a subject uncovers and provides hidden color and details which add a note of authority to the narrator.

Testing

The script is not completed when the last page is written; the announcer (or actor) must read it aloud (rehearse it) to determine how it sounds.

SCRIPT WRITING

Principles

Aural medium

The special characteristic of radio is that it is entirely an aural medium. Radio depends entirely on the ear and must work completely on the image inspired by the sound waves coming from the speaker system.

The sound of a voice (or music) in a radio presentation raises a particular image in the listener's mind. Radio scripts must make clear to the listener the scene or idea desired by the psychological operator.

Power of suggestion

The mind of each listener is a vast storehouse of scenery. The radio writer, through speech, music, and other sounds, enables the listener to visualize each scene.

Freedom of movement

The radio scriptwriter can change scenes as frequently as desired. He can rapidly take his listeners from one event or point on earth (or in space) to another--its all in the mind.

Conflict

Conflict is the attention-getter in a radio script, gaining and increasing audience interest. Conflict is the hero against the villain, good versus evil, the struggle for survival, etc., with the psychological operator offering the solution by way of his script(s).

TECHNIQUES

The imaginative application of techniques is a way to success. The writer must be constantly alert for new ideas and be willing to experiment with variations of old established techniques. The techniques discussed below apply equally to the preparation of scripts for television and loudspeaker operations.

Simplicity	Use simple sentences and words commonly used by the target audience. However, sentence length should be varied to avoid a singsong or monotonous effect.
Conversational style	Write news in a popular, informal, relaxed style. The listener should not be aware that the news is being read to him.
Speech speed	The normal rate of speech will vary among announcers. The scriptwriter should time the rate of speech of each announcer in the language used and tailor the script to gain maximum impact in the allotted time.
Initial attention	As the listener may be running the risk of severe punishment for listening to a forbidden broadcast, the broadcast must gain instant attention. The initial part of the script should convince the listener that the program will be of interest to him. Therefore, the essential facts need to be in the first few sentences to gain interest and to insure that nothing of importance is lost if the program is jammed.
Pacing and timing	Pacing refers to the changes in quality, emotion, thought, or feeling written into the program by the scriptwriter. Timing is controlled by the director and is a shift in the speed of message delivery.
Tongue twisters	Avoid words that successively begin with the same sounds, such as "In providing proper provisional procedures . . ." Avoid words ending in "ch," "sh," "th." These sounds generally produce a hissing noise.
Numbers	Round numbers off, unless the specific number is important. For example, 20 thousand may be used instead of 20,158. Large numbers should be written in the manner easiest to read: one billion 200 million 50 thousand instead of 1,200,050,000.
Unfamiliar names	Avoid beginning a news item with a name that is unfamiliar to the target audience. Introduce the names as "The chief of police, Mr. Jones . . ."
Quotes	<p>The listener cannot see quotation marks. By voice inflection, the announcer can make it clear when a quotation begins and ends. Other methods may be used to indicate a quotation:</p> <p>In Smith's own words . . .</p> <p>To quote Smith . . .</p> <p>As Smith states . . .</p>
Punctuation	Ordinary punctuation marks are ignored in scriptwriting. They can, however, be used as a guide for the announcer. For example, parentheses may be used to set off a phrase. Key words should be capitalized for emphasis. Phonetic spelling may be used to help the announcer with difficult words.

**Profanity and
horror**

The announcer, speaking as a representative of his government and in keeping with the image of the serious, sincere spokesman, will not use profanity in his broadcasts. He will not use horrible descriptions of human suffering, although objective reports have a legitimate place in radio.

Abbreviations

Conventional abbreviations are seldom used. In scriptwriting "Mister" is used instead of "Mr." Any abbreviations used must be familiar to the target audience.

MONITORING

Radio monitoring provides information to the PSYOP current intelligence team on:

- The enemy's domestic and foreign propaganda programs.

- The propaganda the enemy aims at his own military forces in the field.

- Propaganda directed at our forces, and the necessary countermeasures which can and should be taken.

Radio monitoring also provides information for evaluating the effectiveness of US and allied PSYOP. The frequency band is scanned on a random basis to intercept other broadcasts of interest to the US and allied forces.

Operational rules require monitoring personnel to:

- Be objective when giving the monitoring reports.

- Be familiar with the names of persons and places likely to appear in the monitored broadcast.

- Monitor only the station(s) to which assigned. Scan the frequency band only when directed.

- Record the identity of the monitored station, the date and time, and other relevant information pertaining to the monitored broadcast.

- Bring significant information to the attention of superiors immediately. Do not wait to make a scheduled report.

- Use phonetic spelling when in doubt as to the spelling of strange names and places.

TEAM IC, MOBILE RADIO ENGINEER (RADIO TRANSMISSION)

Using the AN/TRT-22, with a general broadcast radius of about 100 miles (160 km), the IC team transmits radio programs in support of psychological operations. The team also performs direct support maintenance on organic communications-electronic equipment. It is capable of multishift operations.

The first consideration in placing the radio transmitter is operational effectiveness. In a wartime environment, consideration also must be given to enemy destructive operations, particularly local actions; e.g., placement of satchel charges, bangalore torpedoes, etc. This requires that not only must antennas be placed where they will operate effectively, but they must also be reasonably near transportation, sources of supply, and troops who will assist in affording protective security.

Reasonable nearness to transportation, engineer, and signal units merits priority consideration because:

The IC team is only 40 percent mobile with organic vehicles.

Movement of equipment--e.g., generators--may require use of heavy vehicles and equipment, such as cranes, wreckers, lowboys, or mobilizers, not available in PSYOP units.

Engineer and signal personnel are needed to erect, maintain, and dismantle the 250-foot (76 meters) antenna used with the AN/TRT-22 radio transmitter.

There is a recurring need for generator fuel, spare parts, and maintenance in addition to other recurring requirements.

Gaining the attention of a PSYOP target audience, building its interest, and ultimately influencing its emotions, opinions, attitudes, and behavior, is not done quickly. Thus, the transmitter must remain on site for an extended time. In fact, in a conflict environment movement is so infrequent as to pose no burden on units needed to transport equipment.

Chapter Eighteen

PRINTED MATERIAL

18

Printed material, which includes leaflets, newspapers, posters, handbills, books, magazines, and such items as novelties, trinkets, and gifts with messages printed on them, is major means of conveying propaganda. A propaganda message printed on substantial material is a relatively permanent document. Once printed and delivered, it can be retained and readily passed from person to person without distortion.

18

A properly developed and designed message (shape, color, format, texture, and other physical characteristics have been duly considered) can have a deep and lasting effect on the target audience.

ADVANTAGES

The printed word has a high degree of acceptance, credibility, and prestige.

Printed matter is unique in that it can be passed from person to person without distortion.

It allows for the reinforcing use of photographs and graphic illustrations which can be understood by illiterates.

It is permanent and the message will not change unless it is physically altered.

It can be disseminated and read or viewed by a larger, widespread target audience.

It can be reread for reinforcement.

Complex and lengthy material can be explained in detail.

It can be hidden and read in private.

Messages can be printed on almost any surface, including useful items.

Printed material can gain prestige by acknowledging authoritative and expert authors. This is particularly important in those societies where the printed word is authoritative.

DISADVANTAGES

A high illiteracy rate reduces the effectiveness and usefulness of the printed message.

Printing operations require special, extensive, continuing logistical support.

Dissemination is time-consuming and costly, requiring the use of special facilities and complex coordination.

As printed material must be physically delivered to the target audience, the enemy can prevent or interfere with its dissemination.

It is less timely than other means of communication.

It can be collected and destroyed by the enemy.

It can be altered by overprinting.

Where prohibited, it can readily be uncovered by search and stringent penalties imposed for possession.

Development and design of effective printed material requires trained and knowledgeable personnel.

PRINTED MATERIAL TECHNIQUES

Do's

Compile catalogs of printed material and make known their existence.

Use illustrations. They increase the attractiveness of the item, arouse the attention of the target audience, and convey meaningful information in a relatively small space. Illustrations are valuable when they enhance the printed message. The best illustrations are clear and appropriate. Use illustrations that show action.

Use photographs instead of sketches whenever possible (except when a sketch, e.g., a cartoon, a caricature, etc., will best evoke a desired emotion within the target audience). People regard photographs as positive proof of events being depicted. Thus, credibility can be markedly enhanced by using photographs of the actual scene or person rather than an artist's conception. Use sharp photographs; out-of-focus or blurred photographs reduce audience interest and the credibility of the message.

Use letters. Letters obtained from defectors, prisoners of war (always adhere to the Geneva Conventions), and other former enemy personnel can be extremely effective. There are, however, a few rules that should be followed:

Do not write letters for someone else. A letter that sounds as though it were written by other than the signing party has no credibility.

You may suggest possible themes and specific details, but the letter must be written by the signator.

Among some audiences poetry can be an effective medium for emotional and sentimental appeals. Good poetry elicits highly favorable reactions, but bad poetry elicits unfavorable reactions. In order to assure quality, well-known, popular poets should be employed.

Don'ts

Do not use long text (particularly in leaflets, posters, and handbills). People in enemy-controlled territory may have to read the printed item surreptitiously. A lengthy text increases the possibility of discovery and reduces the likelihood that people will risk reading it. Long texts discourage the average reader, and the poorly educated may not even try to read lengthy items.

Avoid small print; it discourages readers. Size of print must permit the message to be read immediately.

Avoid duplication of material. Issue only the superior product.

Do not distribute obsolete propaganda. Many printed items have a period of maximal impact. If distributed after the time for which they were meant, the impact may be minimal, nil, or adverse. Therefore, carefully watch for and do not reorder obsolete items (leaflets, posters, etc.).

LEAFLETS

A leaflet is a written or pictorial message on a single sheet of paper. It has no standard size, shape, or format. In selecting the size, shape, and weight of the paper, the primary consideration is that the paper accommodate the message and be easy to distribute. The recommended size, provided the message can be accommodated, is a 15.24 centimeters by 7.72 centimeters (6 by 3 inches) on 7.25- or 9.06- kilogram paper (16- or 20-pound). Leaflets of this size and weight have very favorable aerial dissemination characteristics.

FIGURE 18-1
SAMPLE LEAFLET

Categories of Leaflets

Leaflets may be categorized as persuasive, informative, and directive.

The persuasive leaflet attains its objective through use of reason. Facts are presented so that the audience is convinced that the conclusions reached by the propagandist are valid.

The informative leaflet is factual. In presenting facts previously unknown to the audience, it attracts a reading public by satisfying curiosity.

The directive leaflet directs action when intelligence indicates the target is receptive. It is used to direct and control activities of underground forces. It may be used to disrupt enemy production by giving advance warning of bombing attacks and suggesting that workers in enemy production facilities protect themselves by staying away from work.

During consolidation and foreign internal defense operations, directive leaflets assist in maintaining law and order and in publicizing government programs.

Leaflet Use

Leaflets are developed for specific uses, such as standard, special situation, safe conduct, and news.

Standard leaflets contain general propaganda messages intended for repeated use in all types of psychological operations. They are particularly valuable in fast-moving tactical situations when PSYOP units are unable to prepare leaflets to fit rapidly changing situations. The content of standard leaflets used in support of foreign internal defense, unconventional warfare, and consolidation operations varies widely.

Advantages of Standard Leaflets. Use of standard leaflets:

Permits rapid dissemination of a variety of propaganda messages. Leaflets are prepared in advance, stockpiled in bulk, or loaded in disseminating devices for storage or immediate delivery. This provides flexibility for the use of PSYOP at all levels of command.

Permits standardization of selected propaganda themes or messages, insuring consistency of propaganda content.

Allows cataloging. Standard leaflets are easily cataloged. The availability of catalogs of standard leaflets simplifies the task of integrating selected leaflets into tactical operations.

Permits the most efficient use of large, high-speed presses at theater Army level and maximum use of commercial facilities.

Permits a joint production agency to better control printed propaganda materials.

Allows pretesting well in advance of dissemination.

Insures continuation of the PSYOP effort even though reproduction equipment may be destroyed or temporarily disabled.

Disadvantages of Standard Leaflets:

Standard leaflets are usually less effective than leaflets tailored for a specific action or situation.

They are subject to deterioration.

Circumstances and conditions make them obsolete.

Stockpiles of leaflets become a logistical burden and can be overprinted by the enemy.

They endanger enemy soldiers and civilians seen reading them.

They are instantly identifiable as a PSYOP device; therefore, the leaflet's credibility is suspect.

Contingency leaflets are prepared for an anticipated event.

Special situation leaflets are requested when the standard leaflet message is inadequate to exploit a particular propaganda opportunity, situation, or objective. They are developed when intelligence indicates the existence of a specifically exploitable,

but transient and presumably nonrecurring psychological opportunity. They are intended for use only once because the circumstances which govern their preparation are seldom duplicated.

Use in tactical operations. Tactical PSYOP achieve maximum results when leaflets have specific relevance at the moment of receipt, when psychological pressures are greatest, and when a reasonable course of action is presented. For example, surrender becomes a reasonable course of action only when under current conditions no other alternative action seems plausible.

Use in strategic operations. Strategic PSYOP are made more effective by the use of special situation leaflets that deal with specific problems and discuss them in terms of current facts. The impact is usually cumulative, rather than immediate, extending over weeks, months, or years. These leaflets are used primarily to communicate with special targets, such as foreign workers in enemy or occupied countries, ethnic or religious groups, members of a particular industrial facility or industry, and friendly resistance groups.

Operational considerations. The following operational considerations should determine the use of special situation leaflets:

- Serve as a means for timely exploitation of psychological opportunities.

- Serve as a means to communicate more intimately with the target audience and permit the message to be more precisely slanted to the immediate and particular needs of the audience.

Physical Characteristics of Leaflets

Leaflet production is affected by the physical characteristics of paper, such as shape, texture, quality, size, and weight. Legibility and color reproduction are noticeably affected by paper quality and texture. A high grade of paper is needed for correct color reproduction. Quality also affects durability. **Safe conduct passes should always be printed on durable, high quality paper.**

The major factors involved in selection of paper weights and leaflet sizes are:

- Message length.

- Artwork required.

- Delivery system to be used.

- Press capabilities.

- Purpose of the leaflet.

Format

Although leaflets generally are small, they should contain comparatively large print, particularly when directed toward the enemy. However, a small leaflet with large print makes it necessary to use a text that is brief, to the point, and immediately attractive.

Since enemy personnel and civilians in areas under enemy control are prohibited from picking up or reading leaflets from external sources, the large print enables them to read the message without touching the leaflet. In case the reader wishes to hide the leaflet and read it surreptitiously at a later time, a small leaflet is more easily concealed.

Sequence	The order of presentation must be carefully planned and appropriate for the cultural reading habits of the target.
Headline	The headline is important because it summarizes the entire leaflet and is the part of the text that first catches the eye.
Subheadline	Subheadlines are used to introduce separate paragraphs and highlight the significant points of the message.
Text	The text must be simple and to the point, containing only one theme. The first sentence should contain the substance of the message. Credible and verifiable facts should follow.
Photographs and illustrations	Since photographs and illustrations carry a message, they must be arranged and numbered in a culturally logical sequence. For example, in some cultures the sequence of reading is from right to left, in others from top to bottom and right to left. Placing a number in front of the caption which accompanies a photograph or illustration makes it easier for the reader to follow the sequence.
Captions	Caption all photographs and illustrations. If this is not done, the reader may not understand the point the message is trying to make.

LEAFLET DISSEMINATION

Printed material is the one medium that must be physically delivered to a target audience. This presents problems when attempting to disseminate printed propaganda in enemy-held territory. In denied areas, printed propaganda is generally disseminated by air delivery, line-crossers, military patrols, or international mail.

The method of delivery depends upon a variety of factors, such as:

Political conditions.

Military situation.

Target density and population patterns.

Number and size of leaflets to be delivered.

Enemy countermeasures.

Availability of ordnance and delivery devices.

Weather.

Allocation of air sorties for leaflet missions.

Air-to-Ground Delivery

Paper quality affects the drift of airdropped leaflets. If a leaflet, which offers little or no wind resistance, is dropped from a flying aircraft, it will be blown at about the same speed and direction as the wind. If there are updrafts or downdrafts, the leaflet will still follow the general direction of the wind. In areas of no turbulence the constant pull of gravity acting upon the leaflet will cause it to fall at a fairly constant rate. (See figure 18-3, Leaflet Patterns, and figure 18-4, Detailed View of Leaflet Patterns.)

FLIP-FLOP MOTION

SPIRALING MOTION

FIGURE 18-2
LEAFLET MOTIONS

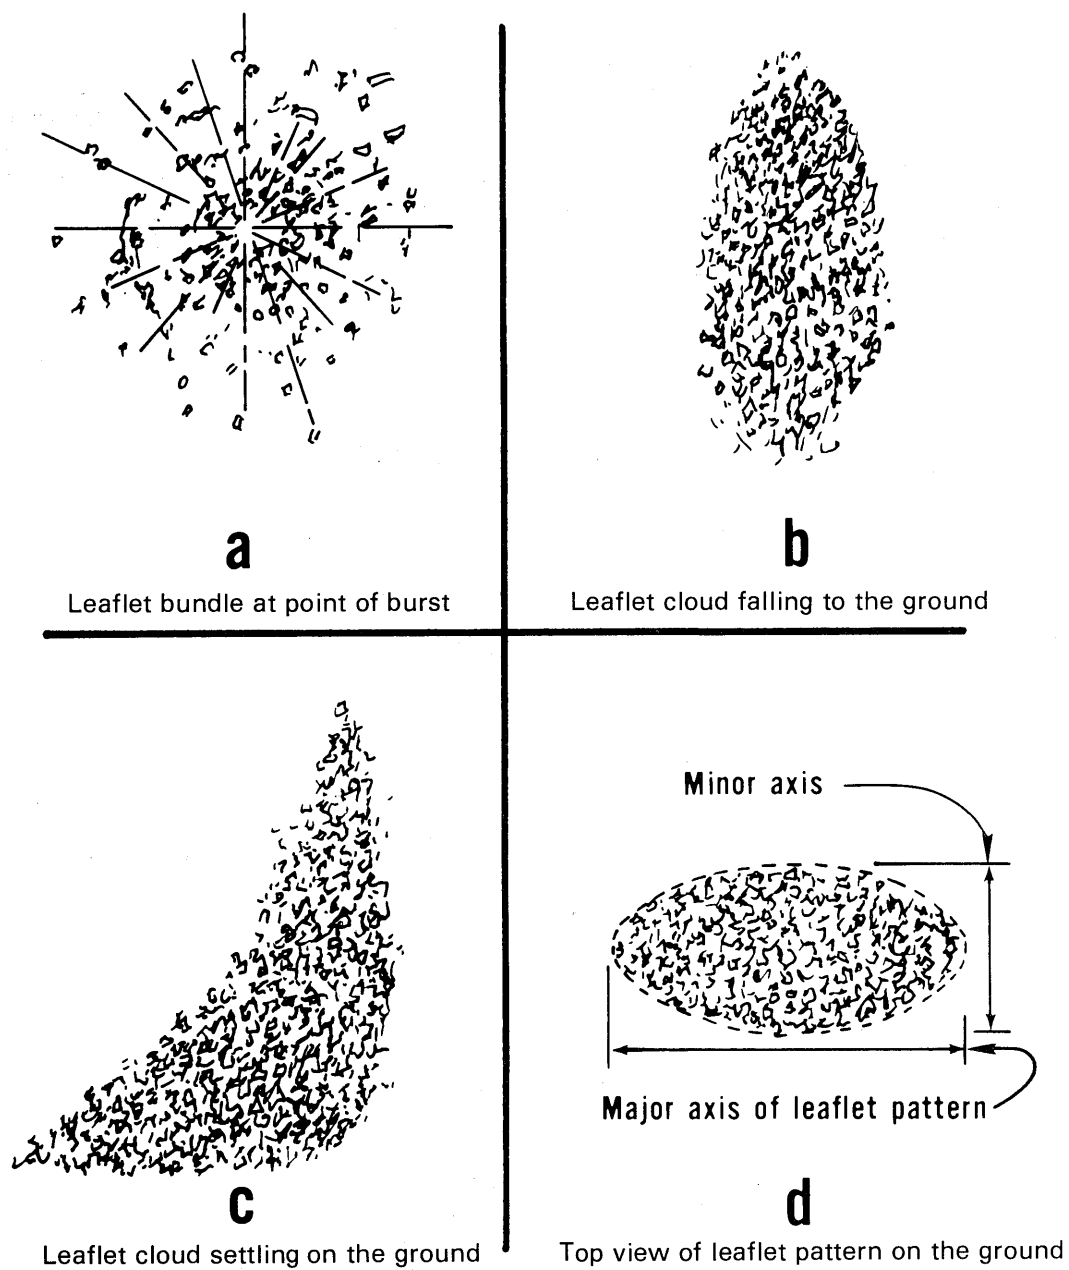

FIGURE 18-3
LEAFLET PATTERNS

FIGURE 18-4

DETAILED VIEW OF LEAFLET PATTERNS

Leaflet density. The basic objective of leaflet drops is to place sufficient leaflets on the ground to insure that every member of the target audience will see (not necessarily possess) a leaflet. To insure that members of the target audience chance upon leaflets, their location and activities must be considered. Target mobility has a great bearing on the number and density of leaflets dropped and on the area that must be covered.

If the target is a soldier dug in a defensive position, his mobility and the possibility that he will find a leaflet are reduced. This type of target requires more leaflets than one consisting of rear area soldiers with greater mobility.

In mountains or jungle areas, mobility is generally restricted to roads, paths, and trails. Leaflets should be concentrated in these areas to increase the possibility that the target will chance upon them.

An urban population will require more leaflets than the population living and working in open rural terrain. The density of leaflets disseminated over a city should be heavy because a great percentage of leaflets will land on inaccessible rooftops.

As a "rule of thumb," the psychological operator should trade lower densities for greater area coverage. Villages and hamlets should be targeted so leaflets will land not only in the village where people live, but also in the fields where they work. Trails in and out of the area should be targeted.

Airdrop by hand (low altitude)

In areas where low-level delivery is feasible, leaflets can be dropped by hand through aircraft doors, ports, or specially fabricated chutes as the delivery aircraft passes over or circles the target area.

FIGURE 18-5

USE OF CHUTES IN LOW-ALTITUDE AIRDROP

Leaflets should be dropped in small quantities at very close intervals. This results in an almost continuous release of leaflets evenly distributed downwind and parallel to the flight of the aircraft. Two men can dispense thousands of leaflets per minute using this efficient, inexpensive technique.

Leaflets printed or distributed in areas of high humidity tend to stick together. Ruffling one or both ends of the leaflet stack insures complete dispersion.

High altitude free-fall

Leaflets dispensed from aircraft flying at altitudes up to 50,000 feet (15,000 meters) are carried to their target by prevailing winds. This technique is well suited for leaflet drops directed at large general target areas. It requires long-range planning and preparation to insure prompt reaction to favorable wind conditions. The advice of skilled meteorological personnel is essential throughout the planning and execution of this operation.

The characteristics of different size leaflets must be known to insure that the proper "mix" of leaflets is used to obtain dissemination throughout the target area.

Static line technique

At high altitudes the use of leaflet bundles or boxes opened by static line has proven effective. Through use of rollers on the deck of the aircraft, boxes weighing up to 50 kilograms (110 pounds) can be ejected with minimum exertion. The steps (figure 18-6) in preparing boxes for high-altitude, static line dissemination are:

Step 1. Using a punch, cut four holes about 6 centimeters by 2 centimeters (2 1/2 inches by 3/4 inch) as indicated in figure 18-6.

Step 2. Cut through the box from one hole to another as illustrated.

Step 3. Place a 5-centimeter (2-inch) wide strip of webbing through the holes. The length of webbing depends on the size of the box; it must be long enough to tie after the box has been filled with leaflets.

Step 4. Place a 10-centimeter (3-or 4-inch) strip of masking tape over the 5-centimeter wide strip of webbing.

Step 5. Cut all four corners of the box from the top to about three-fourths of the way down (or less).

Step 6. Again using masking tape, tape one strip up the cut portion and two across, as illustrated.

Step 7. After filling the box with leaflets, tie the two strips of webbing.

Step 8. Attach one end of the static line to the webbing ties. The length of the static line depends upon the type of aircraft, but it is normally about 4 1/2 meters (15 feet) long.

FIGURE 18-6

METHOD OF FABRICATING BOXES FOR HIGH-ALTITUDE STATIC LINE DISSEMINATION

The box is rolled out of the aircraft, and as the container comes to the end of the static line, the sides of the box split. In effect, it is turned inside out and the leaflets fall away followed by the empty box.

Balloon Operations

Balloon operations, useful for penetrating denied areas, can be conducted up to a range of 2,400 kilometers (1,500 miles). As the use of balloons for other than random drops requires a knowledge and study of wind patterns and air currents from the proposed launching site to the intended target area, a meteorologist must be available from the planning to the launching stages of the operation.

Types of balloons

Balloons are made of paper, rubber, or polyethylene.

Inflation and launching

Balloons should be inflated in an area protected from the elements and launched in winds of 5-7 knots. For safety, helium is preferred; however, hydrogen, a highly inflammable (explosive) gas, will support a slightly heavier load. **Extreme care is required when hydrogen is used:** The crew must wear protective cotton clothing and goggles; no silk, fur, nylon, or other potentially spark-producing clothing may be worn; all inflation equipment must be electrically grounded; and smoking is prohibited.

Other lighter-than-air gases, such as coal gas, may also be used.

Flight

Flight patterns are determined by the weather, wind, air currents, and gas pressure. Flight pattern tables showing altitude, time, distance, payload, and gross load are easily constructed. However, the slightest leak in the balloon will alter the flight pattern.

Tracking

Balloons can be radar tracked for about 40 kilometers (25 miles) by adding a conventional reflector. This distance is enough to establish wind patterns and trajectory.

Payload

Although the maximum payload is 9 kilograms (about 20 pounds), balloons are an inexpensive means of disseminating leaflets.

Coverage of the target

The actual leaflet impact area may vary from that predicted by as much as 10 percent. This does not mean failure, because the dimensions of the leaflet pattern will be large enough to assure substantial coverage of the chosen target.

Remotely Piloted Vehicles (RPVs)

Remotely piloted vehicles are capable of conducting a variety of combat missions including leaflet delivery, surveillance, reconnaissance, electronic warfare, and strike. The remote pilot is able to detect and identify targets, change the course of the RPV, and make decisions to initiate and terminate operations in the target area. **Pinpoint accuracy is possible.**

Use for leaflet drops

RPVs can be flown into enemy territories where the gun and missile antiaircraft defenses are very intense and the losses of manned aircraft might be unacceptable. RPVs similar to those used by the US Air Force for low altitude operations are readily adaptable to leaflet delivery for psychological operations. The RPVs can fly a preselected course at heights as low as a few hundred feet above ground level. The maximum speed will vary from Mach 0.8 for the clean configuration down to about Mach 0.6 when wing pods are installed. **These RPVs can be fitted with modified wing pods providing a large leaflet capacity per mission.**

Launching

Remotely piloted vehicles can be either ground or air launched, resulting in very flexible mission planning. Recovery of the RPVs is accomplished by a parachute system.

US Army variable speed training target

Smaller target drones, such as the US Army's new variable speed training target (VSTT), can be adapted for leaflet dispensing. Since these drones are smaller than the Air Force RPV, they are more easily adapted for short-range operations with the Army in the field.

Leaflet Bomb

The M129E1 leaflet bomb is an Air Force item, obtained through Air Force ordnance channels. Its empty weight is about 52 kilograms (115 pounds) and when loaded with leaflets, approximately 100 kilograms (225 pounds). It can carry approximately 30,000 13 x 20-centimeter (5 1/4 x 8-inch), 16-pound, machine-rolled leaflets. The maximum inside diameter of the bomb is 39.4 centimeters (15 1/2 inches); the minimum is 34.3 centimeters (13 1/2 inches).

FIGURE 18-7

LEAFLET BOMB

Because of the internal configuration, the method for loading 13 x 20-centimeter (5 1/4 x 8-inch) leaflets is to use six 36-centimeter (14 1/2-inch) diameter rolls and one 32-centimeter (12 1/2-inch) diameter roll. Before the leaflets are placed in the bomb, the detonating cord is placed in the seam between the two halves.

The bomb is fuzed and armed at the launch base by Air Force or Navy personnel. When the bomb is released, the fuze functions at a predetermined time, detonating the primer cord separating the two body sections, detaching the fins, and releasing the leaflets.

Surface Delivery

The ground patrol is a useful element for disseminating small amounts of printed material behind enemy lines. Posters, leaflets, pamphlets, kits, and novelties may be placed or scattered by patrols and reconnaissance elements, usually while on regular missions.

Leaflets, posters, and propaganda items can be left behind during retrograde movements.

Infiltrators, line-crossers, and sympathizers can be used to distribute printed propaganda behind enemy lines. They frequently distribute gray or black propaganda.

Propaganda may be mailed to selected individuals or organizations through enemy or neutral postal systems.

In FID situations all agencies of the supported government and civilian public service organizations (to include the religious community) should be used as outlets and distribution points.

Seaworthy containers are easy and inexpensive to use as sea floats. Propaganda is placed in a waterproof container and dropped at predetermined locations at sea, in rivers, or streams. However, access to reliable hydrographic data (prevailing winds, tide, and currents) is needed in order to plot projected courses accurately. Containers may be made of wood, bamboo, glass, plastic, rubber, or similar material. Inexpensive plastic or cellophane envelopes can be profitably used for large-scale float operations. Large-volume dissemination is necessary because a great number of the containers will never reach the designated target audience.

FIGURE 18-8

EXAMPLES OF SEA FLOATS

POSTERS, MAGAZINES, BOOKS, BANNERS, GIFTS, PERSONAL DISPLAY ITEMS

Other types of printed matter known as slow media are also used in psychological operations. These media include posters, pamphlets, books, magazines, reprints, gifts, and other items that contain printed messages. These materials are used primarily in populated and heavily traveled areas.

Posters

Posters include all single-sheet printed and graphic (illustrations, sketches, photographs, and symbols) materials which impart a message by being publicly posted. They are used to inform; their ultimate purpose is to enlist support. The message is generally emotionally colored, intended primarily to influence emotions and gain emotional support.

Posters are a universal medium, easy and inexpensive to produce and place--almost any surface is suitable. Since they present their message pictorially, they have a universal audience that includes illiterates. Properly placed, they cannot be avoided. When placed where people congregate, they stimulate discussion, broadening the impact of the message.

Since the opinions of neutral or other noninvolved foreign audiences may affect the courses of action of the enemy government, its security forces, or its allied and assisting government, posters should be made interesting and appealing to these foreign audiences.

Basic principles

Format.

Use formats, art styles, and forms that are familiar to and appropriate for the target audience. If possible, produce an art form that people want to possess and display.

Graphics.

Give maximum space to simple graphic productions. They attract an audience and significantly increase the impact of the message. Complex graphics, on the other hand, generally confuse the audience and are subject to ambiguous and undesirable interpretations by the audience.

Photographs.

Use photographs or photomontages. People believe them. The less sophisticated the audience, the greater the belief.

Symbols.

Use symbols, inanimate and animate (including human), that are significant to the target audience. Symbols which have positive characteristics (bravery, integrity, leadership, etc.) to the target add prestige and impact to the message.

Color.

As colors have different connotations in different societies, it is important that colors and color combinations used in posters be appropriate to the culture of the target audience. Improper colors may be counterproductive or, at best, nonproductive.

Print for a moving target.

It may be necessary for people to read the unfriendly poster while on the move. Therefore, the poster should be printed in letters of a size that can be read and seen at distances from 10 to 15 meters. For example, an enemy government may impose stringent penalties on any members of its armed forces or civilian population displaying an interest in enemy posters. Or if an enemy shadow government is active and effective, a display of interest in a poster may result in loss of life or limb, injury to family, or destruction of property.

Main point.

The main point, clearly and immediately stated, should occupy the visual center of the poster so it is seen first. In addition, all textual material must relate to the main point of the message.

The appeal.

Make the appeal positive, emotional, simple, and appropriate to the action desired. The poster is too compact to present complex arguments. Do not inflame emotions to the point of violent actions when such actions are neither appropriate nor desired. Overreaction may result in loss of liberty or life and of PSYOP effectiveness.

Slogans.

Slogans reinforce the graphic art and convey emotional appeals that will be long remembered. They are extremely effective in highly authoritative societies and cultures when related to highly emotional issues. In areas of mass illiteracy those who cannot read will hear the slogans spoken frequently, ask the literates to explain them, or have readers available.

Cliches.

Cliches, catchwords, and popular and stereotyped phrases may also be featured with somewhat the same effect as slogans.

Distribution.

Posters must be distributed according to a plan. "Hit-or miss" poster distribution has no part in a poster campaign.

Placement.

Place and display posters where people naturally and habitually gather, and where they have little or nothing to do for brief periods of time; e.g., bus and tram stops, rail stations and depots, parks, outdoor cafes, etc. Posters so displayed are most likely to be exposed to an audience and read.

Viewers tend to associate the poster with the area of placement. This is one reason why posters placed in areas dangerously reached (mountainsides, railroad trestles, water tanks, high walls, etc.) evoke admiration and have a high impact. By the same line of audience reasoning, posters placed in demeaning areas lose their effectiveness.

Vulnerabilities.

Posters are subject to weather conditions. They may be easily removed, destroyed, or defaced. Outdated posters may be used in enemy propaganda. Since a weatherbeaten, obsolete, or defaced poster is a liability, remove it quickly. This requires frequent visits to poster sites.

Magazines, Pamphlets, Reprints

Magazines, pamphlets, and reprints--although differing in length, use of illustrative material, and regularity of distribution--generally have common features as propaganda media:

- All are relatively expensive to produce and distribute.

- There is no limitation as to the kind of propaganda messages they can carry.

- The audience range is unlimited--youth groups, the mass of the population, intellectuals, professionals, etc.

These materials may be dropped from the air, mailed, delivered by messenger, placed in libraries and public areas, or handed out at meetings and rallies or surreptitiously handed out. The contents may be read and discussed on radio and television.

These publications have the basic advantages common to newspapers:

- They are relatively permanent.

- A wide variety of material may be presented, such as:

 - Complex and lengthy articles.

 - Technical and professional information and data.

 - News, features, and items of popular interest.

- Material may be set in a format and edited to appeal to the complete spectrum of audience groups.

- Colorful (and colored) graphic presentations may be made.

These publications also have the disadvantages inherent in newspapers:

- Production and distribution are time-consuming, complex, and expensive.

- They are not suitable for targets of opportunity.

- If national policy or situations change, they can be reminders of past policy and situations and used by the enemy.

- Magazines and pamphlets require the services of skilled editorial and production personnel.

Books

In consolidation and FID/IDAD operations, books are valuable when available to the audience, where there is an interest in them, and time is available to read them.

Manuscripts offered for publication may indicate popular feeling concerning local conditions, the government, the military, etc.

In the early stages of consolidation of occupied areas, PSYOP units will normally assist in distributing books from US or allied sources. PSYOP personnel may also be called upon to assist in a program to rehabilitate the book publishing industry.

The use of local publishers makes it easier to establish book translation programs by publishing, in the local language and at prices within the reach of the target group, selected books of friendly persuasion. Production shortages are likely to exist; therefore, paper stocks, ink, photographic supplies, and other material must be issued on a priority basis to approved publishers, concentrating on priority subjects.

Censorship may be necessary, even of translations of seemingly harmless literature.

A well-planned book program, including children's books, is of great value, particularly in education (and reeducation) programs. Books on any subject can be provided to all target groups. Popular reading will attract the less educated groups. Other books may help to acquaint the target audience with the achievements, aims, and advantages of the programs, activities, and operations of the United States, allies, or host country. A book written by a member (or ex-member) of the target audience can be most influential.

Banners

A banner is any piece of flag-like cloth, paper, or similar surface on which a message is drawn. A banner may be any size or shape, stationary or mobile.

They generally have a one-time use in intensely emotional situations. The message is short, hard hitting, and emotional with only one theme; it may be a rallying point for adherents to a cause. Banners indicate commitment on the part of those who make or carry them.

The major advantages of banners are their symbolism and ability to rally people to a cause. Other advantages are their high visibility and mobility. Banners are a complementary medium, however, and quickly become obsolete.

Personal Display Items

Personal items such as buttons, vehicular stickers, clothing (e.g., T-shirts), or jewelry which display a belief or cause indicate a relatively high degree of commitment. If seen in public at different times and places, they give the appearance of strength for the cause the propagandist advocates. People like winners, and this appearance of strength gains adherents.

Some of the items are relatively expensive, but if attractive, they will be sold. Purchase of expensive items is an indication of strong attachment to the cause represented by the purchased item.

Gifts and Novelties

Any item of practical use may be used as a message-carrying gift; i.e., soap, matches, lighters, cigarette holders, nail clippers, notebooks, calendars, recipe books, seed packets, grocery bags, salt, or other items for which the target group has a need. Novelties such as simple games, puzzles, wall stickers, playing cards, balloons, greeting cards, and other items of no great practical use may carry messages and be distributed.

The use of novelties must be decided at the highest echelon of command because:

- They are expensive.

- They require scarce resources.

- Distribution must be phased into the overall psychological operation.

Gifts, being useful items, do not serve well for propaganda, for the impulse of the recipient is to use the gift, ignoring the message. Gifts small in size need only be stamped with or contain the known symbol of the donor, a slogan, or a brief message. Gift wrappings or containers are also excellent media for messages, symbols, or slogans.

Normally, action messages should be avoided on gifts. An urgent warning or demand for serious sacrifices should not accompany trivial gifts.

The receipt of a useful or amusing item places the recipient in a receptive frame of mind for an accompanying propaganda message.

The major disadvantage of novelties and gifts is the cumulative expense of mass production and distribution. In addition, such items have only a peripheral, passive effect, seldom if ever moving people to action or changing opinions or emotions. At best, such items complement other media.

APPENDIX B

DETAILED BREAKDOWN OF TEAMS

HEADQUARTERS AND ADMINISTRATIVE TEAMS

Team AA, Command and Control (Company).

Capabilities: Command, administrative control, and operational supervision of one to seven platoons or teams. Operates independently as liaison detachment. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per division, separate brigade, task force, MAAG, mission, or equivalent sized command; one per PSYOP liaison requirement.

Mobility: One hundred percent mobile in organic vehicles.

Team AB, Command and Control (Battalion).

Capabilities: Command, administrative control, and operational supervision of two to five PSYOP companies; logistical and administrative support for assigned and attached units; limited procurement and distribution of nonstandard items of equipment and supplies for subordinate operational elements. Operates independently as a liaison detachment. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per army component of a subordinate unified command, corps, civil affairs or military police prisoner-of-war command, or equivalent sized command or as required; one per PSYOP liaison requirement.

Mobility: Thirty-two percent mobile in organic vehicles.

Team AC, Command and Control (Group).

Capabilities: Command of two to five PSYOP battalions; coordination and operational supervision of subordinate elements; specified elements parachute qualified when supporting an airborne unit.

Basis of Allocation: One per theater army, army component of a unified command or corps.

Mobility: Thirty-seven percent mobile in organic vehicles.

Team AD, Command Assessment.

Capabilities: To deploy with a corps deployment package into a hostile area, and analyze and evaluate the psychological warfare possibilities. To make recommendations to ground force commander in the area of psychological operations. To determine what psychological functional teams should be deployed into the area. To evaluate the results of any psychological campaign that had been conducted prior to insertion. To plan the use of themes to be used in a PSYOP campaign.

Basis of Allocation: One per corps deployment package.

Mobility: This team has no organic TOE equipment requiring transportation. Non-TOE equipment and supplies constitute approximately 300 pounds (20 cubic feet).

SUPPLY AND MAINTENANCE TEAMS

Team BA, Supply and Maintenance.

Capabilities: Plans and coordinates logistical requirements for PSYOP units and teams; procures and distributes standard and nonstandard items of equipment and supplies; this team has a minimum vehicle maintenance capability to support PSYOP companies and teams.

Basis of Allocation: One per PSYOP company or separate teams as required.

Mobility: Sixty-seven percent mobile in organic vehicles.

OPERATIONAL TEAMS

Team FA, Propaganda.

Capabilities: Supervises the production of, or develops, propaganda; controls propaganda development activity supporting theater army, corps, division, MAAG, or mission. Operates independently as a liaison detachment as required. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per two to eight Teams FB, FC, FD, or FE, as required; one per major command; one per PSYOP liaison requirement.

Mobility: One hundred percent mobile in organic vehicles.

Team FB, Audio and Television Production.

Capabilities: Prepares audio and television propaganda in the form of sound tapes, scripts, news, commentary, and entertainment programs for dissemination to target audiences by radio, television, and loudspeaker; researches, locates, procures, and records indigenous music and sound effects. Requires augmentation by indigenous linguists. Must be employed with Team ID, Mobile Radio Production, when not operating in a fixed facility.

Basis of Allocation: One or more per propaganda development activity, as required; one or more per Team IA, Mobile Radio Operations, as required; one per ethnic group targeted or geopolitical area of interest.

Mobility: One hundred percent mobile in organic vehicles.

Team FC, Current Intelligence.

Capabilities: Develops intelligence requirements and processes intelligence information to support psychological operations; analyzes current intelligence to determine and verify psychological susceptibilities, vulnerabilities, and opportunities; interrogates prisoners and translates foreign language printed material. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per PSYOP company, battalion, or group as required; one per major enemy unit, ethnic group, targeted, or geopolitical area of interest.

Mobility: One hundred percent mobile in organic vehicles.

Team FD, Research and Analysis.

Capabilities: Performs detailed background study and analysis of specific target groups, prepares PSYOP contingency plans, conducts propaganda analysis of friendly and enemy PSYOP. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per PSYOP group or battalion as required.

Mobility: Fifty percent mobile in organic vehicles.

Team FE, Graphic Production.

Capabilities: Prepares copy and illustrations necessary to produce leaflets, posters, pamphlets, and newssheets. Parachute qualified when supporting an airborne unit. Requires augmentation by indigenous writers and illustrators.

Basis of Allocation: One per PSYOP group or battalion as required; one per PSYOP unit with organic, medium, or heavy printing platoon.

Mobility: Fifty percent mobile in organic vehicles.

Team GA, Light Printing.

Capabilities: Prints propaganda leaflets and newssheets on organic presses. Trims, cuts, packages, rolls, and distributes printed propaganda material for dissemination by aircraft, tube artillery, and other means. Prepares propaganda messages for special situation leaflets and newssheets, as well as reproducing scripts for use by tactical loudspeaker broadcasts. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per PSYOP battalion or company as required.

Mobility: Eighty percent mobile in organic vehicles.

Team GB, Medium Printing (Operations, Camera and Plate).

Capabilities: Plans, controls, and supervises printing operations to produce leaflets, posters, and other propaganda materials. Supervises one to four Teams GC operating at a single location. Executes process photography and prepares photolithographic plates for use by Team GC. Provides electrical equipment maintenance and supply support for itself and attached Teams GC. Capable of multishift operations.

Basis of Allocation: One per mobile medium printing requirement.

Mobility: Fifty percent mobile in organic vehicles.

Team GC, Medium Printing (Press and Processing).

Capabilities: Prints by photolithographic process up to 1,200,000 production units per day of propaganda leaflets, posters, and other printed material to specification. Trims, cuts, rolls, packages, and distributes propaganda material for dissemination by aircraft, artillery, and other means. Provides direct and general support maintenance for organic presses when supported by Teams BA and GB and when welding and machinist support is provided from an outside source. Requires electrical power and administrative transportation support for prolonged operations. Capable of multishift operations.

Basis of Allocation: One to four per Team GB as required.

Mobility: Sixty percent mobile in organic vehicles.

Team GD, Heavy Printing (Operations, Camera and Plate).

Capabilities: Plans, controls, and supervises printing operations to produce leaflets, posters, pamphlets, and other propaganda materials. Supervises one to four Teams GE operating at a single location. Executes process photography and prepares photolithographic plates for use by Team GE. Provides electrical equipment maintenance and supply support for itself and attached Teams GE. Requires a fixed facility and outside source of power for operation. Capable of multishift operations.

Basis of Allocation: One per fixed heavy printing requirement.

Mobility: Five percent mobile in organic vehicles.

Team GE, Heavy Printing (Press and Processing).

Capabilities: Prints by photolithographic process up to 5,000,000 production units per day of leaflets, posters, pamphlets, and other printed propaganda materials. Trims, cuts, folds, stitches, packages, and distributes reproduced material for dissemination. Provides direct and general support maintenance for organic presses when supported by Teams BA and GD and when welding and machinist support is available from an outside source. Requires a fixed facility, external power source, and administrative transportation support for operation. Capable of multishift operations.

Basis of Allocation: One to four per Team GD.

Mobility: Five percent in organic vehicles.

Team HA, Platoon Headquarters (Audio and Visual).

Capabilities: Supervision of two or more Teams GA, HB, and HC, or K-Series Teams. Operates independently as a liaison detachment. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per psychological operations group, battalion, or company as required; one per PSYOP liaison requirement.

Mobility: One hundred percent mobile in organic vehicles.

Team HB, Loudspeaker.

Capabilities: Plans, prepares, records, and conducts live or taped loudspeaker broadcasts in support of psychological operations; produces limited quantity of and distributes leaflets. Loudspeaker with power source may be manpacked or mounted on ground vehicles, boats, or aircraft. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One or more per combat battalion or as required.

Mobility: One hundred percent mobile in organic vehicles.

Team HC, Audio Visual.

Capabilities: Exhibits sound motion pictures, film strips and photographic slides; conducts loudspeaker broadcasts; produces limited quantity of and distributes leaflets; conducts face-to-face propaganda; surveys local population to secure PSYOP intelligence.

Basis of Allocation: One or more per PSYOP battalion or company; one per combat brigade or as required by the tactical or political situation.

Mobility: One hundred percent mobile in organic vehicles.

Team IA, Mobile Radio Operations.

Capabilities: Supervision of Teams IB, IC, ID, and IE when more than one team is deployed to support an operational mission. Provides user level supply support for PSYOP-peculiar communications-electronic equipment organic to subordinate teams. Requires company level administrative support.

Basis of Allocation: One per PSYOP group, battalion, or company as required.

Mobility: Thirty-two percent mobile in organic vehicles.

Team IB, Mobile Radio Monitoring.

Capabilities: Provides news from friendly and enemy radio and teletype sources including CONUS stations and theater headquarters to provide a base for selected propaganda news broadcasts or other propaganda media. Provides tape monitoring of selected broadcasts for subsequent translation and analysis. Performs direct support maintenance on organic communications-electronics equipment. Capable of multishift operations.

Basis of Allocation: One per Team ID or FC as required.

Mobility: One hundred percent mobile in organic vehicles.

Team IC, Mobile Radio Engineer.

Capabilities: Transmits medium or shortwave radio broadcasts in support of propaganda operations. Performs direct support maintenance on organic communications-electronics equipment. Capable of multishift operations.

Basis of Allocation: One per propaganda broadcasting mission.

Mobility: Forty percent mobile in organic vehicles.

Team ID, Mobile Radio Production.

Capabilities: Prepares and produces up to 8 hours of original radio programs per day in support of propaganda operations. Requires augmentation by indigenous announcers and support by Team FB.

Basis of Allocation: One or more per studio production requirement.

Mobility: Sixteen percent mobile in organic vehicles.

Team KA, Fixed Motion Picture.

Capabilities: Provides for the operation of a motion picture installation and/or the operational supervision or advisory assistance for motion picture installations operated by indigenous personnel.

Basis of Allocation: One per motion picture theater when operated by team members. One per three to five motion picture theaters operated by indigenous personnel.

Mobility: One hundred percent mobile in organic vehicles.

Team KB, Fixed Printing.

Capabilities: Provides operational control or advisory assistance for an indigenous newspaper or other type publication plant in a specific geographical area. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per publications' plant as required.

Mobility: Thirty-three percent mobile in organic vehicles.

Team KC, Fixed Radio.

Capabilities: Provides operational control or advisory assistance for an indigenous fixed radio broadcasting station. Parachute qualified when supporting an airborne unit.

Basis of Allocation: One per fixed radio station as required.

Mobility: Sixty-seven percent mobile in organic vehicles.

Team KD, Display.

Capabilities: Supervises preparation of copy and illustrations; provides control or advisory assistance for the preparation of copy, artwork, displays, bulletin boards, signs, and other graphic media. Requires augmentation by indigenous interpreters, writers, and illustrators.

Basis of Allocation: As required.

Mobility: Thirty-three percent mobile in organic vehicles.

Team KE, Fixed Television.

Capabilities: Provides for the operational supervision and/or the operation of an indigenous television broadcasting station; provides advisory assistance for television networks or stations. Provides limited maintenance and repair of a television broadcasting station.

Basis of Allocation: One per television broadcasting facility or as required.

Mobility: Fifty percent mobile in organic vehicles.

APPENDIX C

FORMAT FOR BASIC PSYOP STUDY (BPS)

CLASSIFICATION

TITLE PAGE

Indicate the target country/area.

MAP OF COUNTRY/AREA

Title of map, map number, map sheet number, and scale.

EXECUTIVE SUMMARY

The executive summary should focus on those PSYOP-exploitable vulnerabilities enumerated in the BPS. It should be written in a clear, brief, accurate, and coherent form. The summary should open with a short résumé of the area with its strategic significance and then state the PSYOP-relevant characteristics and conclusions reached in the BPS.

TABLE OF CONTENTS

See Tab 1.

INTRODUCTION

See Tab 2.

CHAPTER 1. HISTORY AND IDEOLOGY

This chapter gives a general review of the evolution of the state and its people, focusing on those aspects having psychological significance. It is not to be a detailed chronology of the country's development. However, the country's history and those factors which contribute to its formation have a preeminent relationship to the country's historical perspective, its attitudes, and its current world position.

The history chapter must be comprehensive in its "issue" orientation because of its special importance to psychological operations. An analysis of those historical issues which bear directly upon present political, economic, and military policies can provide to the operator a solid foundation for the rest of the study.

CHAPTER 2. GOVERNMENT AND POLITICS

This chapter covers the country's political system, giving a descriptive analysis of the sources of political power, the policymaking process, and the political complexities of the country's government. It should include the system's responsiveness to pressure and the system's influence on the country's politics.

When discussing politics, particular attention must be given to the role of the individuals and special interest groups or political parties in the political system. This should include the political attitudes and values of the population, their view of the political system, and the function of the government within their society.

CLASSIFICATION

CLASSIFICATION

CHAPTER 3. FOREIGN RELATIONS AND POLICY

This chapter surveys the country's foreign relations, concentrating on its political alignment in world affairs and its relationship with the United States. It describes the foreign policy of the country, but more important, it analyzes and interprets why the country acts as it does in international affairs.

This analysis and interpretation should cover those leaders who make the decisions that determine foreign policy formation and the success of their policy. This study of the foreign relations gives the psychological operator a view of the country's world position and the reasons for this position. The basis for internal support or opposition, as well as the political climate created by these policies, should be examined.

CHAPTER 4. SOCIETY AND CULTURE

This chapter is a descriptive analysis of the subject country's social setting. This analysis provides the operator with the knowledge needed to understand with whom he is to communicate in a possible PSYOP campaign. Every major aspect of the country's social dynamics which can assist in the assessment of its PSYOP potential must be analyzed.

A study of the country's social organization covers all socially transmitted cultural and behavior patterns and characteristics of the people. These include the society's social values and the role of the family. Its culture, social organization, customs, ethnic composition, and the interrelated effects of religion, language, and history should be addressed.

Associated with this structure are those social patterns of religion, culture, and education which determine the character of a society. An important aspect of the country's social condition, the status of the population's health, and those public programs (or the absence thereof) which seek to improve the general welfare may provide key PSYOP indicators. Social problems and intergroup tensions should be covered.

CHAPTER 5. THE ECONOMY

This chapter presents a brief analysis of the characteristics, structure, and dynamics of the national economy. It covers the target country's economic strengths and weaknesses, current economic and labor problems, and potential economic development.

The general description of the economy details the economic base of the country and the importance of agriculture, industry, and trade. This information is used to determine if the individual's needs are being met by the present economic structure. These economic considerations explain many of the sociological conditions of psychological importance. Of particular importance are perceptions within the society of the wisdom of policies, and how citizens individually or by referent groups stand to gain or lose by the policies.

CHAPTER 6. THE MILITARY ESTABLISHMENT

In addition to its primary function of external defense, the military establishment in most countries can be a valuable participant in, or impediment to, the country's programs of political life. Even when the military establishment is not directly involved in competition for political power, its actions and programs can have a major impact on social and political development.

This chapter is not "order-of-battle" oriented, but it should, as a minimum, analyze and provide conclusions on the following topic areas:

CLASSIFICATION

Emergence of the modern military establishment.

Military roles in the political, economic, and social spheres, and the effects of these roles.

Issues creating cohesion or conflict within the armed forces.

Internal conflicts within the military establishment.

Extent, quality, and influence of foreign military assistance.

CHAPTER 7. COMMUNICATION PROCESS AND EFFECTS

This chapter contains the information essential to understand communications patterns for the implementation of a psychological campaign. It should cover how and through what social means the people of the country communicate with one another (as distinguished from the technical data in the appendix on communications facilities). Data should include languages and language groups, nonverbal communication, and nonverbal symbols peculiar to the country's culture or cultures. It should identify distinctive styles in rhetoric or the visual arts that are significant to PSYOP, as well as dramatic, poetic, and musical forms, that could be used to inspire attitudes, emotions, and behavior desired by the PSYOP planners.

It should include data on formal and informal leadership positions in the society whose incumbents serve as key communicators and opinion leaders. An analysis of the readership and listenership habits of the society as well as an analysis of media effectiveness should also be presented. Freedom of the press issues, if any, should also be addressed.

CHAPTER 8. PSYOP, POLITICAL WARFARE, AND OFFICIAL INFORMATION

This chapter furnishes information on the propaganda conducted by or directed toward the subject country. Research personnel should examine the information efforts of the country's government and agencies, the kinds of domestic and foreign propaganda being produced for the current situation, and the political and philosophical direction of that information. A careful analysis of the effectiveness of propaganda techniques used by institutions within the society may provide useful insights for future US PSYOP efforts.

Propaganda can also come from other countries directed toward the subject country to achieve certain political aims. This chapter, therefore, should explain these foreign efforts, the media employed, to whom directed, and for what political end. Particular attention should be given to United States efforts and facilities for possible use in a future psychological campaign.

CHAPTER 9. POTENTIAL TARGET GROUPS

This chapter is the most important chapter of the BPS in that it synthesizes the most important information and applies it to the identified target groups. There are categories of information that must be used to define the psychological characteristics of each significant target group. These categories are as follows:

The attitude, past and present, and behavior of the target toward the key issues and conditions.

The accessibility of the target to propaganda, including the media to which the target is most responsive.

CLASSIFICATION

Susceptibility to persuasion. This requires a thorough analysis of the conditions and attitudes that pertain to the target. This analysis should determine what behavior patterns the target can be persuaded to adopt, what resistance must be overcome, and what the possibilities are of successful target persuasion. It is recognized that some targets may not be susceptible to any line of persuasion. Conditions change and so may the susceptibility of the target.

The **effectiveness** of the target in influencing other targets or the target's ability to take direct action to influence events. In the case of a single individual, this means how effective he is as a communicator. In the case of a group, it means what is the power of the group in relation to other groups in effecting attitude change or in taking direct action in accordance with the behavioral results desired by the psychological operator. Initially, a group's effectiveness may not be what is desired, but as the situation changes, its effectiveness may also change.

Vulnerabilities and sensitivities. From the standpoint of identifying motivating themes or themes to be avoided, it should be considered that each target will be vulnerable to certain issues and conditions just as it will be sensitive to its own values.

INTRODUCTION

() This Basic PSYOP Study (BPS) is intended to provide a summary of those aspects of (country name) that are deemed to have significance to the planning and conduct of psychological operations. The study, therefore, strives to isolate and identify those PSYOP-relevant vulnerabilities, characteristics, insights, and opportunities that are perceived by the authors to exist in (country name). It is prepared specifically as a basic source document for further development of estimates, plans, and annexes. Although this study can assist in developing concepts for contingency planning, its composition has not been tailored to the conduct of any current plan. Rather, it is intentionally a "neutral" document in the sense that its data and insights can be used with a wide variety of possible present and future political and military developments in the region.

() (Here should be inserted a paragraph which references the authority directing the study, research cutoff date, and provisions for update.)

() The format directed for use in this Basic PSYOP Study is designed in all cases to focus on the PSYOP aspects of the many topics addressed. It is intended that this document should not be viewed as a comprehensive and self-contained area study, but should instead be used in conjunction with, and as a complement to, such other standard references as the Department of the Army Area Handbook Series. In addition, the following aspects of the purpose and method of preparation of this BPS are pertinent:

- a. It results from research that combines both the standard classified products of the national intelligence community and the findings of the academic social science disciplines.
- b. It attempts to be more analytical than descriptive in nature and is, therefore, subject to varying individual perspectives.
- c. It should be read, and its conclusions analyzed, in conjunction with other Basic PSYOP Studies prepared on (regional area).
- d. It does not presume to be either a definitive statement of US foreign policy or a comprehensive and authoritative analysis of (country name), except in those specialized areas that are of direct PSYOP relevance.

() (Here should be inserted a statement of US Policy objectives toward the country in question. This information should be extracted in order of priority from the appropriate ICA Country Plan, Department of State Policy Memorandum, or similar document.)

() Research has revealed certain areas where gaps exist in material presented in this study. These gaps were occasioned by such limitations as the classification level of the BPS, availability of complete and timely information, or time constraints on the scope of the future research. Their enumeration here will hopefully aid future research and point out further inquiries to be made by users of this document.

() (Insert here those issues or BPS relevant data which could not be addressed or completely answered.)

APPENDIX D

FORMAT FOR PSYOP ESTIMATE OF THE SITUATION

CLASSIFICATION

Issuing Headquarters

Location of CP

Date/Time Group

PSYCHOLOGICAL OPERATIONS ESTIMATE OF THE SITUATION NO. __

Reference: List maps, charts, and source documents necessary for understanding the estimate.

1. MISSION

The restated mission determined by the commander after he completes mission analysis in the sequence of command and staff actions. (See FM 101-5.)

2. THE SITUATION AND CONSIDERATIONS

a. Intelligence Situation.

- (1) Characteristics of the area of operations. Analysis of Area of Operations No. ____.
- (2) Enemy strength and dispositions. Identification of forces opposing the command.
- (3) Enemy capabilities.
 - (a) Affecting tactical mission. Intelligence Estimate No. _____.
 - (b) Affecting PSYOP activities.

b. Tactical Situation.

- (1) Present dispositions. Operation Estimate No. _____.
- (2) Possible tactical courses of action.
 - (a) Course of action one.
 - (b) Course of action two.
 - (c) Course of action three.
- (3) Projected operations.

c. Personnel Situation.

- (1) Personnel Estimate No. _____.
- (2) Critical shortages of personnel that will affect PSYOP support of the operation.
- (3) Availability of linguistic personnel.
- (4) Availability of indigenous personnel for employment with PSYOP.

CLASSIFICATION

D-1

CLASSIFICATION**d. Logistic Situation.**

- (1) Logistic Estimate No. _____.
- (2) Status of PSYOP specific equipment.
- (3) Availability of PSYOP related supplies.

e. Civil Affairs Situation.

- (1) Civil Affairs Estimate No. _____.
- (2) Disposition of CA units.
- (3) General attitude of population.
- (4) Anticipated enemy civilian personnel reactions and possible effects upon our actions.

f. PSYOP Situation.

- (1) Disposition of PSYOP elements. (Annex A--Overlay, Disposition of PSYOP Elements.)
- (2) PSYOP situation in the area of operations. Include considerations such as areas to be considered occupied and those to be considered liberated. Include any missions, directives, objectives, or guidance received from higher authority.
- (3) Requirements for indigenous personnel support.
- (4) Peculiarities of operations to be supported that may impact on PSYOP, such as planned use of nuclear weapons, possibility of pursuit or exploitation, planned use of deception measures, previous operations and their effect on enemy morale, etc.

g. Assumptions.

- (1) Approximate length of time that area should remain under control of the command.
- (2) Probable enemy PSYOP reaction to planned operations.
- (3) Other assumptions as required.

h. Special Factors. Other difficulties, difficult patterns, or considerations that may detract from or assist in the accomplishment of PSYOP objectives.**3. ANALYSIS**

- a. Analyze each course of action to determine its advantages and disadvantages for the conduct of psychological operations. This is done by wargaming the course of action from the current disposition through the objective. (Annex B--Target Analysis of Enemy Forces.)
- b. The first part of the analysis is to determine those considerations or enemy capabilities listed in paragraph 2a that will materially assist in choosing the best course of action.
- c. The second step is to analyze each contemplated course of action versus the enemy capabilities. Each course of action is analyzed separately against the enemy capabilities to determine the probable psychological impact.
- d. There is no attempt to compare courses of action in this paragraph.
- e. Identify deficiencies and advantages and disadvantages of each course of action.

CLASSIFICATION

4. COMPARISON

- a. Compare the courses of action to determine which one offers the best chance of success. In the first paragraph, list the advantages and disadvantages of each course of action that affect PSYOP.
- b. Develop and compare methods of overcoming disadvantages in each course of action.
- c. In the last subparagraph state a general conclusion as to which course of action offers the best chance of success for PSYOP.

5. CONCLUSIONS

- a. PSYOP can support the operation.
- b. Tactical course of action number _____ can best be supported from resource viewpoint. Course of action number _____ provides the most exploitable PSYOP situation.
- c. Deficiencies requiring the commander's attention.
- d. Recommend the adoption of course of action number _____.

Annexes: A--Overlay, Disposition of PSYOP Elements (omitted)
 B--Target Analysis, Enemy Military Units (omitted)
 C--Target Analysis, Civilian Groups in Area of Operations (omitted)
 D--Proposed Employment of PSYOP Resources (omitted)

NOTE:

The information contained in the Psychological Operations Estimate of the Situation may be presented in either of two ways. It may be a separate PSYOP estimate as indicated in this appendix, or the considerations may be included in the Civil-Military Operations Estimate as indicated in FM 101-5. This estimate is normally the responsibility of the CMO staff officer, based on input provided by the supporting PSYOP unit.

The PSYOP staff officer in a tactical unit may also make an estimate to determine the best method for accomplishing a PSYOP task. In such a case, he may use the format for the tactical commander's estimate contained in FM 101-5. Similarly, the PSYOP unit commander or staff officer can use the combat service support commander's estimate of the situation.

APPENDIX E

FORMAT FOR PSYOP ANNEX/APPENDIX

CLASSIFICATION

Copy No ____ of ____ copies
Issuing Headquarters
Place of Issue
Date/Time Group
Message Reference Number

ANNEX/APPENDIX ____ (Psychological Operations) to OPORD No. ____.

References: Maps, charts, documents, reports, and other plans which have a significant bearing on the conduct of PSYOP.

Time Zone Used Throughout the Order:

1. SITUATION

a. Enemy Forces.

- (1) Annex A (Intelligence) to OPORD No. ____.
- (2) Psychological situation.
 - (a) Enemy military and civilian morale.
 - (b) Enemy strengths and weaknesses.
- (3) Ideological and psychological factors, favorable and unfavorable.

b. Friendly Forces.

- (1) OPORD No. ____.
- (2) PSYOP capabilities and plans of friendly forces and agencies.
- (3) Refer to command relationship agreements and to requirements for interagency support.
- (4) Periodic PSYOP Report ____.

c. Attachments and Detachments. Task organization OPORD ____.

2. MISSION

A clear, concise, and complete statement of what PSYOP is to accomplish in support of the mission stated in the basic OPORD.

CLASSIFICATION

CLASSIFICATION

3. EXECUTION

- a. **Concept of Operation.** Summarize the course of action and state generally the concept for the conduct and control of PSYOP. Where applicable, indicate phasing of the operation and arrangements for the transfer of operational control of PSYOP assets or the transfer of operational control of psychological operations.
- b. **Tasking.** By subparagraph task the major subordinate headquarters to conduct PSYOP in support of specified objectives and tasks.
- c. **Target Groups.** Identify enemy forces and major target groups that the operation is intended to influence or that are affected by PSYOP actions, information, and propaganda activities conducted in support of the operation. Separately identify subgroups of significance to PSYOP. Include an analysis of the vulnerabilities and effectiveness of each target group and each group's susceptibility to PSYOP. This information may be included as an APPENDIX/TAB to the PSYOP ANNEX/APPENDIX.
- d. **Objectives.**
 - (1) List in separate subparagraphs the officially stated US national policy objectives and the US national psychological objectives within the countries involved.
 - (2) In separate subparagraphs, state the psychological objectives that are to be achieved from the planned operation or that are to be induced in support of the action.
- e. **Themes and Actions To Be Stressed or Avoided.**
 - (1) Themes to be stressed.
 - (2) Themes to be avoided.
 - (3) Supportive actions.
 - (4) Prohibited actions.
- g. **Coordinating Instructions.** List details of coordination, control, and instructions applicable to two or more elements of the command. List procedures necessary for approval of PSYOP to be conducted by subordinate units.

4. SERVICE SUPPORT

- a. **Logistics.** Provide a statement of the logistical arrangements applicable to PSYOP but not covered in the basic order. This paragraph may include but is not limited to:
 - (1) Stocking of propaganda and information materials.
 - (2) Provisions for the supply and maintenance of PSYOP-peculiar supplies and equipment.
 - (3) Provisions for control and maintenance of indigenous equipment and materials.
- b. **Administration.** Provide a statement of administrative arrangements applicable to PSYOP not covered in basic plan. The following items may be included:
 - (1) Requirements for special reports.
 - (2) Fiscal matters relating to special funds.
 - (3) Personnel matters relating to indigenous personnel.
- c. Annex ____ (Service Support) to OPORD ____.

CLASSIFICATION

CLASSIFICATION**5. COMMAND AND SIGNAL.**

- a. Signal. Refer to appropriate annex.
- b. Command. Provide command instructions concerning command post locations. May include topics concerning relationship arrangements of nonmilitary assets available for support.

APPENDIX F

EXPLANATION OF TARGET ANALYSIS WORKSHEET

The target analysis worksheet (figure F-1) is a systematic method of evaluating tentative targets by relating conditions to the psychological objective. It is the basis for the Psychological Operations Campaign Control Sheet. A separate worksheet should be completed for each tentative target surfaced from the study of intelligence. When completed, each target analysis worksheet should be filed in the appropriate PSYOP workbook.

National objective: Obtain from US policy statements and documents. Sources for US objectives relevant to US Army PSYOP might be unified command military plans, ICA Country Program memorandums, Department of State and Defense policy statements, and other related command PSYOP guidances.

Mission: The mission received from the next higher headquarters or that mission which results from an analysis of the unit's general mission and the resultant PSYOP tasks.

Target: Select target based on PSYOP mission.

Conditions: Current events and environmental factors which affect the target group.

Attitude: The known attitudes of the target group relevant to the mission are listed.

Target susceptibility: Information relative to the ability to persuade the target group. Consideration is given to the unfulfilled wants, needs, and feelings of the target group. Susceptibility must not be confused with accessibility.

Psychological objective: The type of behavioral or attitudinal change desired of the target to help accomplish the mission. Psychological objectives should be stated in measurable terms. The psychological objective must be supported by information concerning target susceptibility and effectiveness.

Target effectiveness: The study of power; it deals with the target group's ability to accomplish the psychological objective.

Impact indicators: Those factors which indicate the target audience responded to PSYOP and thus fulfilled the psychological objectives. In devising the psychological objective(s), the analyst must consider questions to be answered which measure its achievement.

NOTE: Those blocks with an asterisk (*) should be cross-referenced to the appropriate section, page, and paragraph of the PSYOP workbook or other reference source. If information to support these blocks is not available, it may be necessary to submit an EEL to intelligence gathering sources.

TARGET ANALYSIS WORKSHEET

NATIONAL OBJECTIVE: To assist oppressed people in self-determination.

MISSION: (PSYCHOLOGICAL OBJECTIVE) Stimulate disaffection against government in power.

TARGET	*CONDITIONS	*ATTITUDE	*TARGET SUSCEPTIBILITY	PSYCHOLOGICAL OBJECTIVE	*TARGET EFFECTIVENESS	IMPACT INDICATORS
Dock workers in _____	Current intelligence indicates that the shortage of food in _____ has resulted in food rationing which favors government officials and deprives urban workers of all but a subsistence diet. (References:	Increasing resentment and animosity toward local bureaucrats. (References:	It should be relatively simple to communicate with this group because their basic need for food is not being effectively met. Their primary concern centers on obtaining sufficient food. They have demonstrated against the government and as a result some were killed and many imprisoned. Preferred communications are those delivered in person by an emotive orator of high prestige. (References:	Persuade the dock workers to take anti-government actions.	This group is well organized and has positive leadership. It is part of a larger union of longshoremen, a critical labor group in this country, dependent upon seaborne communications. These longshoremen have capable representation in the government. The opinions of these representatives are highly significant and are sought after by national leadership. (References:	30% increase in anti-government demonstrations by dock workers. 25% increase in dock worker absenteeism.

Figure F-1.

APPENDIX G

EXPLANATION OF PSYOP CAMPAIGN CONTROL SHEET

The purpose of the psychological operations campaign control sheet is to provide a planning guide that will assist PSYOP planners in organizing and controlling a campaign after the psychological objective(s) has been selected. The campaign control sheet format (figure G-1) is a guide and can be modified to meet local conditions and echelons of command as appropriate.

National objective: The national objective or other applicable policy guidance. This information and the mission received from the next higher headquarters should be transcribed from the target analysis worksheet.

Psychological objective: The measurable psychological objective which has been developed and which will aid in accomplishing the mission. It is stated in terms of desired action and results.

Conditions: A synopsis of the significant entries in the conditions block of the target analysis worksheet.

Target: A summary of the significant attitudes, susceptibility factors, and effectiveness which were contained in the target analysis worksheet.

Related internal development programs: The various ongoing civic action and related programs which support the achievement of the psychological objective. Planned and ongoing programs by other agencies should be noted.

Themes: The lines of persuasion selected through target analysis to be conveyed to the target audience. Care should be taken not to confuse objectives and themes. The theme is the idea to be communicated that will contribute to the accomplishment of the objective.

Campaign: The media to be used, the frequency, and duration.

Implementation: The schedule for monitoring, recording, and controlling propaganda dissemination as the campaign progresses. It reflects changes in duration, intensity, timing, and susceptibilities, and should be completed in pencil.

Campaign impact indicators: The measurable responses that demonstrate the success of the overall campaign.

MISSION (Psychological Objective):

PSYCHOLOGICAL OBJECTIVE	CONDITIONS	TARGET Attitudes- Susceptibility- Effectiveness	RELATED INTERNAL DEVELOPMENT PROGRAMS	THEMES	CAMPAIGN Media-Intensity- Timing	IMPLEMENTATION	CAMPAIGN IMPACT INDICATORS

Psychological Operations Campaign Control Sheet

APPENDIX H

PSYOP BASIC TERMS

Attitudes are positively or negatively learned orientations toward something or someone that have a tendency to motivate an individual or group toward some behavior. Experienced soldiers, for example, have negative attitudes toward slovenliness.

A Basic PSYOP Study (BPS) is a detailed background document which describes the PSYOP-relevant vulnerabilities, characteristics, insights, and opportunities that are known about a specific country susceptible to exploitation.

Culture is a generic term for beliefs, values, and behavior that are learned while symbolically interacting with other individuals or groups. Culture is shared among individuals and groups and transmitted by means of words, symbols, and actions. It is the use of these means that attaches meaning and value to things that make the human animal unique. By learning, sharing, and transmitting certain beliefs and behaviors (i.e., industrialization, democracy) and not others (i.e., agriculture, dictatorship), one culture is distinct from another.

Cultural relativism is the social science principle that no aspect of human life can be judged meaningfully outside the context of a particular society or culture.

Communication is the process of standardizing and exchanging intelligence perceptions and meanings found in the form of value statements, ideas, sentiments, beliefs, etc., using words, symbols, or actions.

Drives (i.e., hunger, thirst, and activity) are unlearned (primary) or physiologically learned (secondary) internal tensions or stimuli which dispose the individual or group to a general behavior that will satisfy a need. Drives may stimulate an individual or group to cooperation, competition, or accommodation in order to insure survival. Hunger, for example, may stimulate the individual or group to cooperate, compete, commit aggression, hoard food, or gather food.

Ethnocentrism denotes the tendency of some people to use their way of life as a standard for judging and, usually, criticizing others. It indicates a belief by individuals that their race, culture, society, etc., are superior to others.

Folkways are types of norms. They are commonly accepted and informally sanctioned rules of behavior. Or, they may be thought of as being popular ways of thinking or acting, which are customary but not insisted upon. Formal punishments (negative sanctions) are not involved for those who deviate from expected behavior, but some form of informal punishment, such as expulsion, avoidance, or ostracism may be applied. Shaking hands as a way of greeting is an example of a folkway.

Frustration is individual or group inner conflict. It is created or increased by preventing or blocking the individual's or group's attainment of a desired goal. For example, the target individual's or group's unsuccessful attempts to visit their families may create frustration. Or, another example: The unrelenting presence of a combat force surrounding them may also create frustration.

Goals are the objectives that guide purposeful behavior to satisfy needs. For example, an individual or group may excel in combat as a goal to satisfy a perceived need for recognition and prestige, or to satisfy their standards of pride.

Group is two or more people recognized by others as a collectivity interacting to achieve common goals.

In-group or we-group is two or more people who have a mutual feeling of belonging together as a group. Each person identifies with the collectivity and is bound by mutual attitudes of cooperation, devotion, comradeship, loyalty, respect, sympathy, group pride, and a belief in their superiority over those outside the group. The attitudes of an in-group tend to motivate the individual or group to be hostile to, contemptuous of, indifferent to, and isolated from other groups. An in-group may also be a prestige group.

Interaction occurs when two or more individuals may come into contact and a change in the behavior and/or attitude of one, some, or all takes place. The psychological operator, using the technique of face-to-face communications, interacts with an individual or group. Through his persuasive message, a behavior and/or attitude change is sought.

Intercultural relations are the interactions between two or more individuals or groups differing in behaviors they have learned, shared, and transmitted by means of words, symbols, and actions.

Key communicator is an individual or group having the economic, social, or political power to persuade the individuals or groups with which he interacts to change or reinforce existing opinions, emotions, attitudes, and behaviors.

Language is the written or spoken word and symbols that denote or connote meanings to an individual or group. The denotational meaning of a word is all of the objects, events, or instances to which a word refers. The connotational meanings carry the emotional impact of language, rather than rational meaning or expression; i.e., feelings and attitudes rather than concrete physical items.

Mores are contemporary, required, and sanctioned rules (norms) of social behavior, similar to folkways, agreed upon by common consent for the welfare of society, whose violation justifies the use of sanctions. For example, in some societies mores exist that prohibit the eating of beef; in others, the eating of pork.

Motives, unlike the generalized predispositions of drives, are learned and goal directed. They are drives plus learning, allowing purposeful behavior to satisfy needs. Through learning, hunger is alleviated by a search for food. This is in contrast to a drive, a generalized disposition that may encompass a search, aggression, or hoarding.

Motivation is the process by which an individual or group initiates conscious, deliberate, and purposeful action. An individual or group may hear a loudspeaker message stating a comrade has defected and received food, clothing, shelter, and a pardon. Consciously and deliberately, an individual or group may lay down their weapons.

Needs may be described as tension-producing deficiencies within an individual or group, deficiencies which create a stimulus or tension. To reduce the tension, the individual or group initiates a need-satisfying behavior. If the need (tension) must be satisfied to sustain life, it is a primary or innate need (i.e., hunger or thirst), inborn, unlearned, and possessed by each individual or group. If the need is acquired by cultural and/or societal interaction, or related to social survival, it is a secondary or learned need.

Norm is the average or standard behavior, attitude, opinion, or perception shared by and expected of individuals and groups. Norms may be considered as rules in the game of life of each respective social group and related to its specific culture. Norms must also be seen as relative to the cultural setting in which they occur.

Opinion is a view, judgment, or appraisal formed in the mind about a particular matter or particular matters. It may also be said to be an intellectually defined judgment of what is true for the individual or group. It may be more influenced by attitudes than facts.

Out-group, other group, or they-group is comprised of all the individuals or groups that are not participants in the in-group/group under study. The group may be subjected to hostility, indifference, isolation, and contempt, behaviors that can be attributed to the in-group's attitudes. It should be noted, however, that not all individuals look at out-groups with hostility or hatred. Another common feeling is one of envy or a strong desire to become a member of the out-group. This is true when the members of the out-group have higher status and prestige, and the individual has the possibility of joining the out-group once he meets certain requirements. For example, businessmen wishing to increase their prestige desire to join increasingly higher status country or tennis clubs, or enlisted persons may desire to become officers.

Perceived needs are those tension-producing deficiencies which are sensed by vision, hearing, smell, taste, and/or touch and consciously evaluated; the aspect of perception is tinted by the individual's or group's culture and society. Tension, for example, could be suggested to the individual by his smelling the aroma of food cooking or by receiving a persuasive message...hunger.

Perception is the process of evaluating information which has been received and classified by the five physical senses (vision, hearing, smell, taste, and touch) and interpreted by criteria of the culture and society.

Politicomilitary activities encompass the complex of military activities which are conducted primarily for their direct, social, economic, political, and psychological impact. The activities, in their purest form, are the interaction of the military with the society-government. The operational concept involves such functions as community relations; civil affairs, to include civic action; psychological operations; certain aspects of informational activities; and coordination with other US Government agencies and friendly foreign governments.

Propaganda is any form of communication in support of national objectives designed to influence the opinions, emotions, attitudes, or behavior of any group in order to benefit the sponsor, either directly or indirectly.

Psychological objective is a statement of measurable response expected from the target audience as a result of PSYOP. The psychological objective must accurately define the specific behavioral response or attitude change desired which, in turn, must support the PSYOP goals.

Psychological operations include psychological warfare and encompass those political, military, economic, and ideological actions planned and conducted to create in neutral, friendly, and nonhostile foreign groups the emotions, attitudes, or behavior to support the achievement of national objectives.

Psychological warfare is the planned use of propaganda and other psychological actions to influence the opinions, emotions, attitudes, and behavior of hostile foreign groups in such a way as to support the achievement of national objectives.

Society is an enduring and cooperative social group whose members have developed organized patterns of relationships, traditions, institutions, and collective activities and interests. Societies may be considered to be relatively independent human groupings that have their own territory, contain persons of all ages and both sexes, and maintain their unique respective lifestyle (culture). The American people, for instance, have formed lasting and cooperative social groupings which demonstrate organized patterns of behavior such as religious, educational, and political systems.

Stimulus is an action agent or activity that inherently promotes or causes a response, stimulation always implying a response. For example, a persuasive message, airdropped into an industrial area, may warn of an impending air bombardment. The message may act as a stimulus, stimulating a mass evacuation of the area.

Strategic PSYOP are generally designed to further broad or long-term aims in coordination with general strategic planning, with gradual results realizable in the indefinite future. They are directed at enemy troops and civilians behind the combat zones or in enemy, friendly, or neutral countries. See "strategic psychological warfare," JCS Pub 1.

Susceptibility is the degree to which the target audience can be influenced to respond in ways that will assist in the accomplishment of the PSYOP portion of the commander's mission.

Symbols are objects or images whose values or meanings are given by those who use or recognize them; the values are not derived from physical properties. For example, the dove may be a symbol of peace.

Taboo is a prohibition whose violation is expected to produce an automatic penalty such as expulsion, confinement, or death at the hands of someone believed to have supernatural powers.

The complete message is the propaganda message (word) and action (deed) to persuade the individual or group to change or strengthen their opinions, emotions, attitudes, and behavior; the words and deeds are mutually supportive. The deed plus the word equals the message.

Value is the believed ability of someone or something to satisfy a psychological, physical, or social need of an individual or group. For example, an individual or group may defect to satisfy a human need for security, while another individual or group will remain with their fighting unit to satisfy their need for security and/or their pride in self and unit.

Vulnerability is a condition or sensitivity which creates a need within the target audience, rendering it responsive to persuasive appeals.

APPENDIX I

PSYOP TECHNIQUES

Knowledge of propaganda techniques is necessary to improve one's own propaganda and to uncover enemy PSYOP stratagems. Techniques, however, are not substitutes for the procedures in PSYOP planning, development, or dissemination.

Techniques may be categorized as:

Characteristics of the content self-evident. No additional information is required to recognize the characteristics of this type of propaganda. "Name calling" and the use of slogans are techniques of this nature.

Additional information required to be recognized. Additional information is required by the target or analyst for the use of this technique to be recognized. "Lying" is an example of this technique. The audience or analyst must have additional information in order to know whether a lie is being told.

Evident only after extended output. "Change of pace" is an example of this technique. Neither the audience nor the analyst can know that a change of pace has taken place until various amounts of propaganda have been brought into focus.

Repetition. This technique can be noted only after the same word, theme, message, or phrase has been used a number of times.

Nature of the arguments used. An argument is a reason, or a series of reasons, offered as to why the audience should behave, believe, or think in a certain manner. An argument is expressed or implied.

Inferred intent of the originator. This technique refers to the effect the propagandist wishes to achieve on the target audience. "Divisive" and "unifying" propaganda fall within this technique. It might also be classified on the basis of the effect it has on an audience.

SELF-EVIDENT TECHNIQUE

Appeal to Authority. Appeals to authority cite prominent figures to support a position, idea, argument, or course of action.

Assertion. Assertions are positive statements presented as fact. They imply that what is stated is self-evident and needs no further proof. Assertions may or may not be true.

Bandwagon and Inevitable Victory. Bandwagon-and-inevitable-victory appeals attempt to persuade the target audience to take a course of action "everyone else is taking." "Join the crowd." This technique reinforces people's natural desire to be on the winning side. This technique is used to convince the audience that a program is an expression of an irresistible mass movement and that it is in their interest to join. "Inevitable victory" invites those not already on the bandwagon to join those already on the road to certain victory. Those already, or partially, on the bandwagon are reassured that staying aboard is the best course of action.

Obtain Disapproval. This technique is used to get the audience to disapprove an action or idea by suggesting the idea is popular with groups hated, feared, or held in contempt by the target audience. Thus, if a group which supports a policy is led to believe that undesirable, subversive, or contemptible people also support it, the members of the group might decide to change their position.

Glittering Generalities. Glittering generalities are intensely emotionally appealing words so closely associated with highly valued concepts and beliefs that they carry conviction without supporting information or reason. They appeal to such emotions as love of country, home; desire for peace, freedom, glory, honor, etc. They ask for approval without examination of the reason. Though the words and phrases are vague and suggest different things to different people, their connotation is always favorable: "The concepts and programs of the propagandist are always good, desirable, virtuous."

Generalities may gain or lose effectiveness with changes in conditions. They must, therefore, be responsive to current conditions. Phrases which called up pleasant associations at one time may evoke unpleasant or unfavorable connotations at another, particularly if their frame of reference has been altered.

Vagueness. Generalities are deliberately vague so that the audience may supply its own interpretations. The intention is to move the audience by use of undefined phrases, without analyzing their validity or attempting to determine their reasonableness or application.

Rationalization. Individuals or groups may use favorable generalities to rationalize questionable acts or beliefs. Vague and pleasant phrases are often used to justify such actions or beliefs.

Simplification. Favorable generalities are used to provide simple answers to complex social, political, economic, or military problems.

Transfer. This is a technique of projecting positive or negative qualities (praise or blame) of a person, entity, object, or value (an individual, group, organization, nation, patriotism, etc.) to another in order to make the second more acceptable or to discredit it. This technique is generally used to transfer blame from one member of a conflict to another. It evokes an emotional response which stimulates the target to identify with recognized authorities.

Least of Evils. This is a technique of acknowledging that the course of action being taken is perhaps undesirable but that any alternative would result in an outcome far worse. This technique is generally used to explain the need for sacrifices or to justify the seemingly harsh actions that displease the target audience or restrict personal liberties. Projecting blame on the enemy for the unpleasant or restrictive conditions is usually coupled with this technique.

Name Calling or Substitutions of Names or Moral Labels. This technique attempts to arouse prejudices in an audience by labeling the object of the propaganda campaign as something the target audience fears, hates, loathes, or finds undesirable.

Types of name calling:

Direct name calling is used when the audience is sympathetic or neutral. It is a simple, straightforward attack on an opponent or opposing idea.

Indirect name calling is used when direct name calling would antagonize the audience. It is a label for the degree of attack between direct name calling and insinuation. Sarcasm and ridicule are employed with this technique.

Cartoons, illustrations, and photographs are used in name calling, often with deadly effect.

Dangers inherent in name calling: In its extreme form, name calling may indicate that the propagandist has lost his sense of proportion or is unable to conduct a positive campaign. Before using this technique, the propagandist must weigh the benefits against the possible harmful results. It is best to avoid use of this device. The obstacles are formidable, based primarily on the human tendency to close ranks against a stranger. For example, a group may despise, dislike, or even hate one of its leaders, even openly criticize him, but may (and probably will) resent any nongroup member who criticizes and makes disparaging remarks against that leader.

Pinpointing the Enemy: This is a form of simplification in which a complex situation is reduced to the point where the "enemy" is unequivocally identified. For example, the president of country X is forced to declare a state of emergency in order to protect the peaceful people of his country from the brutal, unprovoked aggression by the leaders of country Y.

Plain Folks or Common Man: The "plain folks" or "common man" approach attempts to convince the audience that the propagandist's positions reflect the common sense of the people. It is designed to win the confidence of the audience by communicating in the common manner and style of the audience. Propagandists use ordinary language and mannerisms (and clothes in face-to-face and audiovisual communications) in attempting to identify their point of view with that of the average person. With the plain folks device, the propagandist can win the confidence of persons who resent or distrust foreign sounding, intellectual speech, words, or mannerisms. The audience can be persuaded to identify its interests with those of the propagandist:

Presenting soldiers as plain folks. The propagandist wants to make the enemy feel he is fighting against soldiers who are "decent, everyday folks" much like himself; this helps to counter themes that paint the opponent as a "bloodthirsty" killer.

Presenting civilians as plain folks. The "plain folks" or "common man" device also can help to convince the enemy that the opposing nation is not composed of arrogant, immoral, deceitful, aggressive, warmongering people, but of people like himself, wishing to live at peace.

Humanizing leaders. This technique paints a more human portrait of US and friendly military and civilian leaders. It humanizes them so that the audience looks upon them as similar human beings or, preferably, as kind, wise, fatherly figures.

Categories of Plain Folk Devices:

Vernacular. This is the contemporary language of a specific region or people as it is commonly spoken or written and includes songs, idioms, and jokes. The current vernacular of the specific target audience must be used.

Dialect. Dialect is a variation in pronunciation, grammar, and vocabulary from the norm of a region or nation. When used by the propagandist, perfection is required. This technique is best left to those to whom the dialect is native, because native level speakers are generally the best users of dialects in propaganda appeals.

Errors. Scholastic pronunciation, enunciation, and delivery give the impression of being artificial. To give the impression of spontaneity, deliberately hesitate between phrases, stammer, or mispronounce words. When not overdone, the effect is one of deep sincerity. Errors in written material may be made only when they are commonly made by members of the reading audience. Generally, errors should be restricted to colloquialisms.

Homey words. Homey words are forms of "virtue words" used in the everyday life of the average man. These words are familiar ones, such as "home," "family," "children," "farm," "neighbors," or cultural equivalents. They evoke a favorable emotional response and help transfer the sympathies of the audience to the propagandist. Homey words are widely used to evoke nostalgia. **Care must be taken to assure that homey messages addressed to enemy troops do not also have the same effect on US/friendly forces.**

If the propaganda or the propagandist lacks naturalness, there may be an adverse backlash. The audience may resent what it considers attempts to mock it, its language, and its ways.

Social Disapproval: This is a technique by which the propagandist marshals group acceptance and suggests that attitudes or actions contrary to the one outlined will result in social rejection, disapproval, or outright ostracism. The latter, ostracism, is a control practice widely used within peer groups and traditional societies.

Virtue Words. These are words in the value system of the target audience which tend to produce a positive image when attached to a person or issue. Peace, happiness, security, wise leadership, freedom, etc., are virtue words.

Slogans: A slogan is a brief striking phrase that may include labeling and stereotyping. If ideas can be sloganized, they should be, as good slogans are self-perpetuating.

Testimonials: Testimonials are quotations, in or out of context, especially cited to support or reject a given policy, action, program, or personality. The reputation or the role (expert, respected public figure, etc.) of the individual giving the statement is exploited. The testimonial places the official sanction of a respected person or authority on a propaganda message. This is done in an effort to cause the target audience to identify itself with the authority or to accept the authority's opinions and beliefs as its own. Several types of testimonials are:

Official Sanction. The testimonial authority must have given the indorsement or be clearly on record as having approved the attributed idea, concept, action, or belief. Four factors are involved:

Accomplishment. People have confidence in an authority who has demonstrated outstanding ability and proficiency in his field. This accomplishment should be related to the subject of the testimonial.

Identification with the target. People have greater confidence in an authority with whom they have a common bond. For example, the soldier more readily trusts an officer with whom he has undergone similar arduous experiences than a civilian authority on military subjects.

Position of authority. The official position of authority may instill confidence in the testimony; i.e., head of state, division commander, etc.

Inanimate objects. Inanimate objects may be used in the testimonial device. In such cases, the propagandist seeks to transfer physical attributes of an inanimate object to the message. The Rock of Gibraltar, for example, is a type of inanimate object associated with steadfast strength.

Personal Sources of Testimonial Authority.

Enemy leaders. The enemy target audience will generally place great value on its high level military leaders as a source of information.

Fellow soldiers. Because of their common experiences, soldiers form a bond of comradeship. As a result, those in the armed forces are inclined to pay close attention to what other soldiers have to say.

Opposing leaders. Testimonials of leaders of the opposing nation are of particular value in messages that outline war aims and objectives for administering the enemy nation after it capitulates.

Famous scholars, writers, and other personalities. Frequently, statements of civilians known to the target as authoritative or famous scholars, writers, scientists, commentators, etc., can be effectively used in propaganda messages.

Nonpersonal Sources of Testimonial Authority.

Institutions, ideologies, national flags, religious, and other nonpersonal sources are often used. The creeds, beliefs, principles, or dogmas of respected authorities or other public figures may make effective propaganda testimonials.

Factors To Be Considered.

Plausibility. The testimonial must be plausible to the target audience. The esteem in which an authority is held by the target audience **will not always** transfer an implausible testimonial into effective propaganda.

False testimonials. Never use false testimonials. Highly selective testimonials? Yes. Lies (fabrications)? Never. Fabricated (false) testimonials are extremely vulnerable because their lack of authenticity makes them easy to challenge and discredit.

PROPAGANDA TECHNIQUES WHICH ARE BASED ON CHARACTERISTICS OF THE CONTENT BUT WHICH REQUIRE ADDITIONAL INFORMATION ON THE PART OF AN ANALYST TO BE RECOGNIZED

Incredible truths. There are times when the unbelievable (incredible) truth not only can but should be used. Among these occasions are:

When the psychological operator is certain that a vitally important event will take place.

A catastrophic event, or one of significant tactical or strategic importance, unfavorable to the enemy has occurred and the news has been hidden from the enemy public or troops.

The enemy government has denied or glossed over an event detrimental to its cause.

A double-cutting edge. This technique has a double-cutting edge: It increases the credibility of the US/friendly psychological operator while decreasing the credibility of the enemy to the enemy's target audience. Advanced security clearance must be obtained before using this technique so that operations or projects will not be jeopardized or compromised. Actually, propagandists using this technique will normally require access to special compartmented information and facilities to avoid compromise of other sensitive operations or projects of agencies of the US Government.

Though such news will be incredible to the enemy public, it should be given full play by the psychological operator. This event and its significance will eventually become known to the enemy public in spite of government efforts to hide it. The public will recall (the psychological operator will "help" the recall process) that the incredible news was received from US/ allied sources. They will also recall the deception of their government. The prime requirement in using this technique is that the disseminated incredible truth must be or be certain to become a reality.

Insinuation. Insinuation is used to create or stir up the suspicions of the target audience against ideas, groups, or individuals in order to divide an enemy. The propagandist **hints, suggests, and implies**, allowing the audience to draw its own conclusions. Latent suspicions and cleavages within the enemy camp are exploited in an attempt to structure them into active expressions of disunity which weaken the enemy's war effort.

Exploitable vulnerabilities. Potential cleavages which may be exploited include the following:

- Political differences between the enemy nation and its allies or satellites.

- Ethnic and regional differences.

- Religious, political, economic, or social differences.

- History of civilian animosity or unfair treatment toward enemy soldiers.

- Comforts available to rear area soldiers and not available to combat soldiers.

- People versus the bureaucracy or hierarchy.

- Political differences between the ruling elite, between coalitions members, or between rulers and those out of power.

- Differences showing a few benefiting at the expense of the general populace.

- Unequal or inequitable tax burdens, or the high level of taxes. The audience should be informed of hidden taxes.

- The scarcity of consumer goods for the general public and their availability to the various elites and the dishonest.

- Costs of present government policies in terms of lost opportunities to accomplish constructive socially desirable goals.

- The powerlessness of the individual. (This may be used to split the audience from the policies of its government by disassociating its members from those policies.) This technique could be used in preparing a campaign to gain opposition to those government policies.

Insinuation devices. A number of devices are available to exploit these and similar vulnerabilities:

- Leading questions:** The propagandist may ask questions which suggest only one possible answer. Thus, the question, "What is there to do now that your unit is surrounded and you are completely cut off?" insinuates that surrender or desertion is the only reasonable alternative to annihilation.

- Humor:** Humor can be an effective form of insinuation. Jokes and cartoons about the enemy find a ready audience among those persons in the target country or military camp who normally reject straightforward accusations or assertions. Jokes about totalitarian leaders and their subordinates often spread with ease and rapidity. However, the psychological operator must realize that appreciation of humor differs among target groups and so keep humor within the appropriate cultural context.

- Pure motives.** This technique makes it clear that the side represented by the propagandist is acting in the best interests of the target audience, insinuating that the enemy is acting to the contrary. For example, the propagandist can use the theme that a satellite force fighting on the side of the enemy is insuring the continued subjugation of its country by helping the common enemy.

Guilt by association: Guilt by association links a person, group, or idea to other persons, groups, or ideas repugnant to the target audience. The insinuation is that the connection is not mutual, accidental, or superficial.

Rumor: Malicious rumors are also a potentially effective form of insinuation.

Pictorial and photographic propaganda: A photograph, picture, or cartoon can often insinuate a derogatory charge more effectively than words. The combination of words and photograph, picture, or cartoon can be far more effective. In this content, selected and composite photographs can be extremely effective.

Vocal: Radio propagandists can artfully suggest a derogatory notion, not only with the words they use, but also by the way in which they deliver them. Significant pauses, tonal inflections, sarcastic pronunciation, ridiculing enunciation, can be more subtle than written insinuation.

Card stacking or selective omission: This is the process of choosing from a variety of facts only those which support the propagandist's purpose. In using this technique, facts are selected and presented which most effectively strengthen and authenticate the point of view of the propagandist. It includes the collection of all available material pertaining to a subject and the selection of that material which most effectively supports the propaganda line. Card stacking, case making, and censorship are all forms of selection. Success or failure depends on how successful the propagandist is in selecting facts or "cards" and presenting or "stacking" them.

Increase prestige: In time of armed conflict, leading personalities, economic and social systems, and other institutions making up a nation are constantly subjected to propaganda attacks. Card stacking is used to counter these attacks by publicizing and reiterating the best qualities of the institutions, concepts, or persons being attacked. Like most propaganda techniques, card stacking is used to supplement other methods.

The technique may also be used to describe a subject as virtuous or evil and to give simple answers to a complicated subject.

An intelligent propagandist makes his case by imaginative selection of facts. The work of the card stacker in using selected facts is divided into two main phases:

First, the propagandist selects only favorable facts and presents them to the target in such a manner as to obtain a desired reaction.

Second, the propagandist uses these facts as a basis for conclusions, trying to lead the audience into accepting the conclusions by accepting the facts presented.

Presenting the other side: Some persons in a target audience believe that neither belligerent is entirely virtuous. To them propaganda solely in terms of right and wrong may not be credible. Agreement with minor aspects of the enemy's point of view may overcome this cynicism. Another use of presenting the other side is to reduce the impact of propaganda that opposing propagandists are likely to be card stacking (selective omission).

Lying and distortion: Lying is stating as truth that which is contrary to fact. For example, assertions may be lies. **This technique will not be used by US personnel.** It is presented for use of the analyst of enemy propaganda.

Simplification: This is a technique in which the many facts of a situation are reduced so the right or wrong, good or evil, of an act or decision is obvious to all. This technique (simplification) provides simple solutions for complex problems. By suggesting apparently

simple solutions for complex problems, this technique offers simplified interpretations of events, ideas, concepts, or personalities. Statements are positive and firm; qualifying words are never used.

Simplification may be used to sway uneducated and educated audiences. This is true because many persons are well educated or highly skilled, trained specialists in a specific field, but the limitations of time and energy often force them to turn to and accept simplifications to understand, relate, and react to other areas of interest.

Simplification has the following characteristics:

It thinks for others: Some people accept information which they cannot verify personally as long as the source is acceptable to them or the authority is considered expert. Others absorb whatever they read, see, or hear with little or no discrimination. Some people are too lazy or unconcerned to think problems through. Others are uneducated and willingly accept convenient simplifications.

It is concise: Simplification gives the impression of going to the heart of the matter in a few words. The average member of the target audience will not even consider that there may be another answer to the problem.

It builds ego: Some people are reluctant to believe that any field of endeavor, except their own, is difficult to understand. For example, a layman is pleased to hear that "law is just common sense dressed up in fancy language," or "modern art is really a hodgepodge of aimless experiment or nonsense." Such statements reinforce the ego of the lay audience. It is what they would like to believe, because they are afraid that law and modern art may actually be beyond their understanding. Simple explanations are given for complex subjects and problems.

Stereotyping is a form of simplification used to fit persons, groups, nations, or events into readymade categories that tend to produce a desired image of good or bad. Stereotyping puts the subject (people, nations, etc.) or event into a simplistic pattern without any distinguishing individual characteristics.

CHARACTERISTICS OF CONTENT WHICH MAY BECOME EVIDENT WHEN NUMEROUS PIECES OF OUTPUT ARE EXAMINED

Change of Pace: Change of pace is a technique of switching from belligerent to peaceful output, from "hot" to "cold," from persuasion to threat, from gloomy prophecy to optimism, from emotion to fact.

Stalling: Stalling is a technique of deliberately withholding information until its timeliness is past, thereby reducing the possibility of undesired impact.

Shift of Scene: With this technique, the propagandist replaces one "field of battle" with another. It is an attempt to take the spotlight off an unfavorable situation or condition by shifting it to another, preferably of the opponent, so as to force the enemy to go on the defense.

REPETITION

An idea or position is repeated in an attempt to elicit an almost automatic response from the audience or to reinforce an audience's opinion or attitude. This technique is extremely valid and useful because the human being is basically a creature of habit and develops skills and values by repetition (like walking, talking, code of ethics, etc.). An idea or position may be repeated many times in one message or in many messages. The intent is the same in both instances, namely, to elicit an immediate response or to reinforce an opinion or attitude.

PROPAGANDA TECHNIQUES BASED ON THE NATURE OF THE ARGUMENTS USED

The two major types of arguments used in propaganda are rational and nonrational. When this category is used, it must be understood that the truth or falsity of the content has nothing to do with the nature of the argument. Thus, an elaborate structure of reasons proposed to a target audience might consist entirely of lies but still qualify as a rational appeal.

The outstanding example of a rational argument is one using the least-of-evils technique. Selection, case making, and card stacking also fall within the category of rational arguments, as might appeals to authority and, possibly, testimonials.

Nonrational arguments sometimes contain numerous virtue words or engage in considerable name calling. But the mere presence of these characteristics is insufficient reason to label an argument nonrational.

PROPAGANDA CLASSIFIED ON THE BASIS OF THE INFERRED INTENTS OF THE ORIGINATOR

Anticipatory or Preparatory: This type of propaganda is disseminated in order to bring the expectancies of the target audience in line with the realities of the situation. This technique which prepares the audience for the "worst" is used to soften the blow of an unfavorable situation or result.

Divisive Propaganda: Divisive propaganda intentionally raises issues to stir up dissent and factions within the target audience.

Hot Potato: Hot potato is a technique in which the propagandist presents a potentially embarrassing event, situation, or issue in order to force the enemy to respond, knowing that the response will put the opponent in a bad light.

Coercive Propaganda: This type of propaganda uses forceful or threatening language in order to intimidate the target audience into supporting a position. It is of limited value and duration.

Fear themes and messages: Fear themes and messages are among the most effective means of influencing target audiences. Fear which binds group members against the outside, such as fear that the enemy (the outsider) will block, erode, or destroy the basic values of the audience, has long been used by individuals and groups having parochial interests. In the realm of politics this is illustrated when factions within a political entity are bitterly split over an important issue and someone from outside the entity enters the conflict with his solution to the divisive problem. The differing parties will immediately unite (close ranks) against the outsider.

Using fear messages: When using fear messages, give specific, simple instructions in offering a solution that minimizes the possibility of danger. The message must state or infer that the action called for can be performed if the target follows precisely the simple and precise instructions given in the message. In giving instructions, the psychological operator wants to affect behavior, not test intelligence.

Effectiveness of fear messages: Fear messages are most effective when:

They arouse fear for the safety and welfare of the individual and close family members.

The source of the message is prestigious and credible to the target audience.

The audience is not familiar with the details of the threat posed. Ignorance of the details can be used to pose a threat and build fear.

Members of the audience are self-centered.

The target can take immediate action to execute simple, specific instructions.

Fear of change. People fear change, particularly sudden, imposed change over which they have no control. They fear it will take from them status, wealth, family, friends, comfort, safety, life, or limb. That's why the man in the foxhole hesitates to leave it. He knows and is accustomed to the safety it affords. He is afraid that moving out of his foxhole will expose him to new and greater danger. That is why the psychological campaign must give him a safe, honorable way out of his predicament or situation.

Terrorism: The United States is absolutely opposed to the use of terror or terror tactics. But the psychological operator can give a boomerang effect to enemy terror, making it reverberate against the practitioner, making him repugnant to his own people, and all others who see the results of his heinous savagery. This can be done by disseminating fully captioned photographs in the populated areas of the terrorist's homeland. Such leaflets will separate civilians from their armed forces; it will give them second thoughts about the decency and honorableness of their cause, make them wonder about the righteousness of their ideology, and make the terrorists repugnant to them. Followup leaflets can "fire the flames" of repugnancy, indignation, and doubt, as most civilizations find terror repugnant.

In third countries: Fully captioned photographs depicting terroristic acts may be widely distributed in third countries (including the nation sponsoring the enemy) where they will instill a deep revulsion in the general populace. Distribution in neutral countries is particularly desirable in order to swing the weight of unbiased humanitarian opinion against the enemy.

The enemy may try to rationalize and excuse its conduct (terroristic), but in so doing, it will compound the adverse effect of its actions, because it can never deny the validity of true photographic representations of its acts. Thus, world opinion will sway to the side of the victimized people.

Friendly territory: Under no circumstances should such leaflets be distributed in friendly territory. To distribute them in the friendly area in which the terrorists' acts took place would only create feelings of insecurity. This would defeat the purpose of the psychological operator, which is to build confidence in the government or agency he represents.

APPENDIX J

GRAPHICS, MUSIC, AND SOUND

EFFECTS REGISTER GUIDES

Lists and files of art, music, and sound effects native to the anticipated area or country of operations should be prepared by PSYOP units. The material should be continuously reevaluated and upgraded.

The lists in this appendix are guides to material to support propaganda production or in-country PSYOP campaigns.

GRAPHICS REGISTER GUIDE

Scenery and Scenes:

- Scenery

- Street scenes, cities, towns, villages, hamlets

- Idyllic scenes

People:

- Key personalities

- Members of target audience ethnic groups

- Crowds

- Children in ordinary and extraordinary, charming, amusing, sad, or tragic poses or activities

- Target audience ethnic groups engaged in their various occupations

- Military groups with accurate depiction of uniforms, arms, and equipment

- Families at home, work, play

- Depictions of all possible emotions by individuals

- Clothing of all groups and ages, both sexes (including common denominator infantry clothing)

The Home:

- Interiors, exteriors, all types of domiciles, private and public buildings, installations, and factories

- Furniture and furnishings

- Food, food preparation, eating habits, sources of food

Noneconomic Events and Activities:

- Activities involving US, friendly and enemy military personnel, and target civilian population groups
- Social activities of all groups and ages
- Religious activities
- Amusements
- Sports
- Unusual events and incidents

Economic Activities:

- Industrial
- Commercial
- Financial
- Agricultural
- Waterborne
- Other normal occupations
- Unusual occupations of all groups
- Means of transportation, from human bearers to aircraft

Equipment-Occupational and Household:

- Tools, farm implements
- Weapons
- Utensils, cutlery

Art Forms:

- Music
- Dance
- Painting, drawing, sculpture
- Representations of femininity
- Representations of masculinity
- Pornography--of areas in which acceptable

Military:

- Records (photographic, if possible) of all rehabilitation, MAP, AID, and other similar support, US and foreign
- Records (photographic, if possible) of typical pre-MAP or AID conditions, especially of well-known buildings and installations
- Records (photographs, if possible) of war damages

Records (photographs, if possible) of friendly PSYOP and audience reactions

Long-range photography (close-up, if possible) of enemy frontline positions and fortifications

Photographs of the activities, comforts, and conditions of prisoners of war and civilian internees. Must not be in violation of Rules of Land Warfare and pertinent conventions.

MUSIC REGISTER GUIDE

A music file should be established. The following outline can be used as a guide for such a file:

Folk tunes: dances, ballads

Classics: operas, traditional music

Popular music: currently popular, perennially popular, jazz

Patriotic music: national anthems, military, special holiday, ceremonial, and historical music

Religious music

Denied music: Each music composition, song, or ditty which has been denied to target audiences should be collected, stored, and prepared for use as occasions warrant

Songs of vendors: Record and collect these as feasible

SOUND EFFECTS REGISTER GUIDE

Musical openings, closing bridges, and other sound effects are of vital importance to the dramatic emphasis which may be integrated into sound programs (radio, loudspeaker, television). Ideally, they should be produced by local musicians from areas of operational interest during nonconflict periods. Suggested types of sound effects which should be stored are-

Musical Effects:

Majestic fanfares to usher in processions of dignitaries

Music connotating massive bustling activity of major proportions and importance

Musical announcements of a gathering of martial forces

Fanfares for important announcements

Heavy dramatic openings, serious (some in minor key)

Light dramatic openings, some comic and gay

Medium dramatic openings, not comic nor heavy

Dramatic martial openings, especially for documentaries

Musical connotations of massive destruction, as of a destroyed city, scorched earth, a deserted village, or a wasteland

Musical suggestions of desperation, strong emotions, or agitation

Comical musical representations

Connotations of a mysterious atmosphere with overtones of menace

Meditations

Suggestions of a whimsical tale to follow; light, frothy

Musical descriptions of a street scene, business activities, many people, shopping, bargaining, traffic tieups

Swirling fogs, musically described

Treachery, musically invoked

Musical descriptions of the emotional reactions to a moral blow

Musical reaction to the worst possible news

Musical connotations of the awakening of anger followed by that which evokes mysterious menace, purposeful revenge

Dangerous action

Tone pictures of early morning, of songbirds, or the morning dew--of an awakening, a beginning

Peasant dances, gatherings

Musical equivalent of a comic or amusing interlude, clowns dancing

Music for nature at work, activities of nature, birds, animals

Man at work, building, creating

Warm feeling of an emotional uplift

Musical description of hope awakening, help coming

Music for the approach of the unknown--its steady approach, closer and closer

A poignant stab

An emotional shock, changing to a mood of mystery

Sharp stabs--strings

Stab and holds, repeated to build up tension (varying lengths)

Light dramatic curtains

Medium dramatic curtains

Heavy dramatic curtains

Documentary curtains

Fear music, reactions to approaching disasters

Martial music, national pride musically expressed

Sadness, music connotating the loss of something dear

Musical contemplation, connotating relaxed moods

Music expressing excitement, hurry, confusion, bustle

Other Sound Effects:

Sounds of military action

Street noises

Airport sounds

Animal sounds

Sounds of the market place

Farm sounds

Train and boat whistles

Sounds of various types of vehicles

Sounds of school, bells, children at play, in class

Sounds of church, mosque, temple, etc; praying, bells, gongs, drums, songs, dances, etc.

Sounds of local people at work, play, at home

Transportation sounds, harbor sounds, truck, rail, and other transport sounds

Additional Sound Effects: Additional sound effects are frequently necessary for the production of radio and television programs. Some are also pertinent to loudspeaker broadcasts.

31 AUGUST 1979

By Order of the Secretary of the Army:

E. C. MEYER

*General, United States Army
Chief of Staff*

Official:

J. C. PENNINGTON

*Major General, United States Army
The Adjutant General*

DISTRIBUTION:

Active Army, ARNG, and USAR: To be distributed in accordance with DA Form 12-11B, Requirements for Psychological Operations, US Army Doctrine (Qty rqr block no. 326) and Psychological Operations, Techniques and Procedures (Qty rqr block no. 327).

Additional copies can be requisitioned from the US Army Adjutant General Publications Center, 2800 Eastern Boulevard, Baltimore, MD 21220.

Errata #1

25 MAY 99

Specific Instruction and Errata for
Nonresident Training Course

PHOTOGRAPHY (BASIC)

1. No attempt has been made to issue corrections for errors in typing, punctuation, etc. that do not affect your ability to answer the question or questions.
2. To receive credit for deleted questions, show this errata to your local course administrator (ESO/scorer). The local course administrator is directed to correct the course and the answer key by indicating the questions deleted.
3. Change the following items in the NRTC:
 - a. Question 1-56: change Alt 3 from "545.45 feet" to "45.46 feet"
 - b. Question 2-75: change Alt 2 from "120°F" to "122°F"
 - c. Question 3-52: change the word "camera" in the question's stem to "light meter"
 - d. Page 36, Figure 5A: change Alt E from "How" to "Who"
 - e. Question 6-15: change the first word in line 2 of the question's stem from "control" to "limit"
 - f. Question 7-10: change the date in line 5 of the question's stem from "1885" to "1985"
 - g. Question 9-1: change Alt 3 from "No. 0" to "No. 3"
 - h. Question 9-70: change Alt 3 from "CC05Y + CC15M only" to "CC05Y + CC10M only"
 - i. Question 10-49: change Alt 3 from "Censorship and physical" to "Censorship and physical security"
 - j. Question 10-49: change Alt 4 from "Physical and cryptographic" to "Physical security and cryptographic."
4. Delete the following questions and leave the corresponding spaces blank on the answer sheets:

Questions: 3-21, 3-27, 3-28, 6-54, 10-45

PREFACE

By enrolling in this self-study course, you have demonstrated a desire to improve yourself and the Navy. Remember, however, this self-study course is only one part of the total Navy training program. Practical experience, schools, selected reading, and your desire to succeed are also necessary to successfully round out a fully meaningful training program.

COURSE OVERVIEW: In completing this nonresident training course, you will demonstrate a knowledge of the subject matter by correctly answering questions on the following topics: Theory of Light and Optical Principles; Light Sensitive Cameras and Controls; Basic Photographic Techniques; Photographic Assignments; Portraiture; Copying; Chemical Mixing; Image Processing and Control; Black-and-White Printing; Color Printing; Motion Media; and Job Control and Photographic Finishing.

THE COURSE: This self-study course is organized into subject matter areas, each containing learning objectives to help you determine what you should learn along with text and illustrations to help you understand the information. The subject matter reflects day-to-day requirements and experiences of personnel in the rating or skill area. It also reflects guidance provided by Enlisted Community Managers (ECMs) and other senior personnel, technical references, instructions, etc., and either the occupational or naval standards, which are listed in the *Manual of Navy Enlisted Manpower Personnel Classifications and Occupational Standards*, NAVPERS 18068.

THE QUESTIONS: The questions that appear in this course are designed to help you understand the material in the text.

VALUE: In completing this course, you will improve your military and professional knowledge. Importantly, it can also help you study for the Navy-wide advancement in rate examination. If you are studying and discover a reference in the text to another publication for further information, look it up.

Sailor's Creed

"I am a United States Sailor.

I will support and defend the Constitution of the United States of America and I will obey the orders of those appointed over me.

I represent the fighting spirit of the Navy and those who have gone before me to defend freedom and democracy around the world.

I proudly serve my country's Navy combat team with honor, courage and commitment.

I am committed to excellence and the fair treatment of all."

SUMMARY OF PHOTOGRAPHER'S MATE TRAINING MANUALS

PHOTOGRAPHY (BASIC)

Photography (Basic), NAVEDTRA 12700 consists of the following subjects: the principles associated with light, optics, cameras, light-sensitive materials, and equipment; still and motion-media shooting techniques; chemical mixing; image processing and printing; job control; and photographic finishing.

PHOTOGRAPHY (ADVANCED)

Photography (Advanced), NAVEDTRA 12701 consists of the following subjects: aerial photography; photographic quality assurance; electronic imaging; photographic layout and design; photographic supply; and silver recovery.

CREDITS

The illustrations listed below are included in this edition of *Basic Photography*, through the courtesy of the designated sources. Permission to use these illustrations is gratefully acknowledged. Permission to reproduce illustrations and other materials in this publication must be obtained from the source.

INSTRUCTIONS FOR TAKING THE COURSE

ASSIGNMENTS

The text pages that you are to study are listed at the beginning of each assignment. Study these pages carefully before attempting to answer the questions. Pay close attention to tables and illustrations and read the learning objectives. The learning objectives state what you should be able to do after studying the material. Answering the questions correctly helps you accomplish the objectives.

SELECTING YOUR ANSWERS

Read each question carefully, then select the BEST answer. You may refer freely to the text. The answers must be the result of your own work and decisions. You are prohibited from referring to or copying the answers of others and from giving answers to anyone else taking the course.

SUBMITTING YOUR ASSIGNMENTS

To have your assignments graded, you must be enrolled in the course with the Nonresident Training Course Administration Branch at the Naval Education and Training Professional Development and Technology Center (NETPDTC). Following enrollment, there are two ways of having your assignments graded: (1) use the Internet to submit your assignments as you complete them, or (2) send all the assignments at one time by mail to NETPDTC.

Grading on the Internet: Advantages to Internet grading are:

- you may submit your answers as soon as you complete an assignment, and
- you get your results faster; usually by the next working day (approximately 24 hours).

In addition to receiving grade results for each assignment, you will receive course completion confirmation once you have completed all the

assignments. To submit your assignment answers via the Internet, go to:

<http://courses.cnet.navy.mil>

Grading by Mail: When you submit answer sheets by mail, send all of your assignments at one time. Do NOT submit individual answer sheets for grading. Mail all of your assignments in an envelope, which you either provide yourself or obtain from your nearest Educational Services Officer (ESO). Submit answer sheets to:

COMMANDING OFFICER
NETPDTC N331
6490 SAUFLEY FIELD ROAD
PENSACOLA FL 32559-5000

Answer Sheets: All courses include one “scannable” answer sheet for each assignment. These answer sheets are preprinted with your SSN, name, assignment number, and course number. Explanations for completing the answer sheets are on the answer sheet.

Do not use answer sheet reproductions: Use only the original answer sheets that we provide—reproductions will not work with our scanning equipment and cannot be processed.

Follow the instructions for marking your answers on the answer sheet. Be sure that blocks 1, 2, and 3 are filled in correctly. This information is necessary for your course to be properly processed and for you to receive credit for your work.

COMPLETION TIME

Courses must be completed within 12 months from the date of enrollment. This includes time required to resubmit failed assignments.

PASS/FAIL ASSIGNMENT PROCEDURES

If your overall course score is 3.2 or higher, you will pass the course and will not be required to resubmit assignments. Once your assignments have been graded you will receive course completion confirmation.

If you receive less than a 3.2 on any assignment and your overall course score is below 3.2, you will be given the opportunity to resubmit failed assignments. **You may resubmit failed assignments only once.** Internet students will receive notification when they have failed an assignment--they may then resubmit failed assignments on the web site. Internet students may view and print results for failed assignments from the web site. Students who submit by mail will receive a failing result letter and a new answer sheet for resubmission of each failed assignment.

COMPLETION CONFIRMATION

After successfully completing this course, you will receive a letter of completion.

ERRATA

Errata are used to correct minor errors or delete obsolete information in a course. Errata may also be used to provide instructions to the student. If a course has an errata, it will be included as the first page(s) after the front cover. Errata for all courses can be accessed and viewed/downloaded at:

NAVAL RESERVE RETIREMENT CREDIT

If you are a member of the Naval Reserve, you may earn retirement points for successfully completing this course, if authorized under current directives governing retirement of Naval Reserve personnel. For Naval Reserve retirement, this course is evaluated at 15 points. These points will be credited to you upon satisfactory completion of the assignments as follows:

<u>UNIT</u>	<u>ASSIGNMENTS</u>	<u>POINTS</u>
1	1-8	12
2	9-10	3

(Refer to *Administrative Procedures for Naval Reservists on Inactive Duty*, BUPERSINST 1001.39, for more information about retirement points.)

CHAPTER 1

THEORY OF LIGHT AND OPTICAL PRINCIPLES

Light is the photographer's medium, and a photograph is the image of a pattern of light recorded on film. The word *photography* means *writing or drawing with light*. Without light there could be no vision or photography because it is light reflected from the world around us that makes things visible to both our eyes and the eye of the camera. The nature of light has a critical effect on the pictures you make. Few photographers actually understand much about light. But they are not alone. Scientists have never been able to agree fully about the nature of light. However, certain useful things are clear and well understood about how light behaves.

Light is a form of electromagnetic radiant energy to which the eye is sensitive. It travels at tremendous speed from its source, such as the sun, a fluorescent lamp, an

electronic flash, or whatever source is used. It has an effect on the materials it falls on, skin becomes tanned, and fruit is ripened by the light of the sun. Depending on the way in which light is received or rejected, a complex pattern of light, shade, and color results.

Other types of radiant energy, such as radio waves and X rays, are similar to light but the eye cannot see them. Thus they are not light. By definition, light is electromagnetic energy visible to the human eye. All other electromagnetic energy is invisible, therefore, is not considered light. Ultraviolet and infrared radiations are two such invisible radiations that are of concern to the photographer.

Light makes up the visible spectrum, which is a small part of the entire electromagnetic spectrum (fig. 1-1).

Figure 1-1.—The electromagnetic energy spectrum.

C302.7

Figure 1-2.—Wavelength.

CHARACTERISTICS OF LIGHT

The subject of light as a form of radiant energy has been theorized upon, experimented with, and studied by many physicists and scientists. Until about three centuries ago, no one had developed a reasonable theory of the nature of light. Then Max Planck, a physicist, published a theory in which light was supposed to consist of a stream of high-speed particles. Planck theorized that any light source sent out an untold number of these particles. This then was the *quantum theory*. The *quantum* of light is called the *photon*. The quantum theory is used to explain X ray, radiation, and photoelectricity.

WAVELENGTH, SPEED, AND FREQUENCY

About the same time other physicists, Christiann Huygens and Thomas Young, introduced a theory called the *wave motion theory*. The wave motion theory is used to explain reflection, refraction, diffraction, and polarization. In wave motion theory, light, wavelength, speed, and frequency are important characteristics, and they are interrelated.

The wavelengths of light are so small that they are measured in nanometers (nm). A nanometer is equal to one millionth of a millimeter. Wavelengths of light range from about 400nm to 700nm in length and travel in a straight-line path.

The speed of light varies in different mediums. In air, light travels about 186,000 miles per second. In a denser medium, such as glass, light travels even more slowly. Furthermore, in a denser medium, the speed is different for each color of light. Wavelength is the distance from the crest of one wave to the crest of the next wave (fig. 1-2). Frequency is the number of waves passing a given point in 1 second. The product of the two is the speed of light.

Therefore:

Speed = Wavelength x frequency, or

$$\text{Wavelength} = \frac{\text{Speed}}{\text{Frequency}}$$

Since the speed of light in glass is slower than in air, the wavelength must also be shorter (fig. 1-3). Only the wavelength changes; the frequency remains constant. Hence we identify a particular type of radiation (color of light) by its wavelength, *bearing in mind that we are speaking of the wavelength in air*.

EMISSION OF LIGHT

To the photographer, there are two important characteristics of the way light travels. First, in a given medium, light always travels in a straight line. Second, in a given medium, it travels at a constant speed.

Figure 1-3.—Variation in speed and wavelength.

Figure 1-4.—Light emitted from a source.

Once light is produced (emitted), it is no longer dependent on its source, and only its speed is affected by the many mediums through which it can travel. Another example of the independence of light is that when light travels from air into a denser but transparent medium, such as glass, its speed is reduced. But when it leaves the glass, it returns to its original speed. This changing speed is important in *refraction*, a behavior of light that allows lenses to form images.

Unless light is reflected or focused, it travels or radiates in all directions from the source. As light travels from the source, its energy of light spreads out. The greater the distance it travels, the more it spreads out (fig. 1-4). Therefore, the amount of light reaching a given area at a given distance is less than that reaching the same area closer to the source. In other words, the intensity of illumination on a surface varies when the distance between the light source and the surface, or

subject, is changed. This becomes important when exposing film with artificial light.

COLOR OF LIGHT

Look at a bright, red apple on a dark, green tree. It is hard to believe that color is not an inherent property of these objects; in fact color is not even inherent to light. What you are seeing is a visual perception stimulated by light. The apple and tree are only visible because they reflect light from the sun, and the apple appears red and the tree appears green because they reflect certain wavelengths of light more than others. In this case, these particular wavelengths are seen by the human eye as red and green. When we see a color, we are simply seeing light of a particular wavelength.

When a beam of light has a relatively even mixture of light of all visible wavelengths, it appears as white light. When this beam of white light is passed through a prism, its different wavelengths are spread apart and form a visible spectrum. This visible spectrum is seen as a band of colors, such as violet, blue, blue-green, green, yellow, and red (fig. 1-5).

COLOR TEMPERATURE

White light is made up of nearly equal intensities of all wavelengths within the visible spectrum. By passing white light through a prism, scientists have found that light sources have many qualities. They are as follows:

- Different wavelengths are present in the sources of radiant energy.
- The frequency and color of wavelengths vary.

Figure 1-5.—Refraction of light by a prism.

C302.8

- With each wavelength, there is a variation in the amount of energy.

This variation of energy is called spectral energy distribution. The spectral energy of a light source is represented by color temperature. These terms are used in photography to describe and define the sources of light being used.

Color temperature describes the color quality of a light source in terms of the amounts of red light and blue light. Color temperature is based on what is called a *Planckian radiator*, or simply a *black body*. As the temperature of the metal of the *black body* is raised, it goes from a dull black through red and orange to blue and finally to white heat. The quality of the light emitted is a function of the temperature of the metal. When the object is red-hot, the *color* temperature is low since red is at the low end of the scale; and when it is blue-white, the color temperature is high. However, the *temperature* at which a light source is burned does not control *color temperature*; for example, a fluorescent tube burns at a low 125°F, yet it has a high color temperature. Color temperature then is raised or lowered relatively by the amount of visible white light radiated from the source. Be careful not to get confused. Traditionally reddish light is known as *warm* and bluish light as *cold*; in actuality, the color temperatures is the other way around.

The most convenient way to describe the color temperature of a light source is by its Kelvin temperature. From a practical point of view, this term refers to the degree of whiteness of the light. Color temperature is measured on the Kelvin scale and is stated as Kelvin temperature. On the temperature scale, 0 K is the same as -273°C. Therefore, degrees Kelvin (K) are always 273 degrees higher than the same temperature on the Celsius scale. Thus a red-hot piece of iron with an approximate temperature of 2000°C has a color temperature of 2273 K. As the Celsius temperature of an object is raised, it emits a whiter light and produces a relatively higher color (Kelvin) temperature.

COLOR RELATIONSHIPS

Many ways have been devised to classify the colors we see. Though terminology may differ, it is generally agreed that color can be defined by three qualities: *hue*, *brightness*, and *saturation*.

- ◆ **Hue**-Hue is the actual color or wavelength reflected by an object-red, yellow, green, and so forth. For example, it could be said that the color of an object

is blue. Blue identifies the hue. There are seven hues in the visible spectrum. These seven hues are as follows: blue, green, red, cyan, magenta, yellow, and white. Hue, however, is an inadequate description of a color. To be more specific, we should say that an object is dark blue or light blue. Now we have described the brightness of the color.

- **Brightness**-The brightness of a color is independent of the hue. Two colors may have the same hue but different brightness. Thus, to describe a color or brightness, we say that it is dull, bright, vivid, or brilliant.

- ◆ **Saturation**-The saturation of a color is the degree to which the color departs from neutral gray of the same brightness. You can think of it as mixing black, gray, or white paint with a colored paint, thus diluting the color. In other words, saturation is a measure of color purity.

BEHAVIOR OF LIGHT

Light waves travel in straight lines. When light waves encounter an object or new medium, they act in one or more of the following ways:

- ◆ They may be reflected.
- They may be absorbed.
- ◆ They may be transmitted.

REFLECTION

When light is reflected, it acts in a certain way. When the reflecting surface is smooth and polished, the reflection is orderly, or *specular*. Specular light is reflected at the same angle to the surface as the light incident to the surface; that is, the path of the light reflected from the surface forms an angle exactly equal to the one formed by its path in reaching the surface. Thus *the angle of reflection is equal to the angle of incidence*, which is a characteristic of specular light (fig. 1-6, view A). However, when the object surface is not smooth and polished but irregular, light is reflected irregularly or *diffused* (fig. 1-6, view B); that is, the light is reflected in more than one direction.

Practically all surfaces reflect both specular and diffused light; smooth surfaces reflect more specular light, and rough surfaces more diffused light. Since diffused light is more common than specular light, it is of greatest value in photography. Objects that are not light sources are visible and therefore photographic.

Figure 1-6.—Reflected light.

only because they reflect the light that reaches them from some luminous source.

ABSORPTION

When light strikes a medium and is neither reflected nor transmitted (passed on), it is said to be absorbed. Black cloth or areas of dark forest, for instance, absorb more light than objects such as a white sheet or a coral sand beach. When light comes in contact with the surface of an object, a certain degree of reflection, and some absorption, always takes place.

A medium that does not allow light to pass through it is *opaque*. An opaque material may also reflect light. When an object is opaque and the light is not reflected, it is absorbed by the object. When light is absorbed, its energy is converted and it no longer exists as light.

The color of an object is determined by the way it absorbs light falling upon it (incident light). A woman's dress appears red when it absorbs the blue and green rays of white light and reflects the red waves. A lawn appears green because the grass blades absorb the red and blue rays of light and reflect the green rays.

Neutral colors, such as white, black, and the various tones or values of gray, actually absorb almost equal proportions of the colors of light. Varying reflective powers account for their differences. White is highly reflective, while an object of absolute blackness, no matter how much light falls on it, can never be recorded on film except by contrast.

Figure 1-7.—Effects of different media.

TRANSMISSION

In addition to being reflected and absorbed, light rays may be transmitted. They may also pass through some medium they encounter. When objects can be clearly seen through the medium, the medium is *transparent*. A transparent medium transmits light rays in a regular, or uniform, pattern. When the medium transmits light but breaks up the orderliness of the pattern, sending the transmitted rays in many directions, the medium is *translucent*. In other words, a medium is said to be translucent when light is visible through it, but objects are NOT clearly distinguishable. Thin fabrics and frosted glass are examples of translucent materials that allow the passage of diffused light (fig. 1-7). One important form of transmission is termed *refraction*.

REFRACTION

The change of direction that occurs when a ray of light passes from one transparent substance into another substance of different density is called *refraction*. Refraction enables a lens to form an image. Without refraction, light waves behave as X rays and pass in straight lines through all suitable substances without any control of direction, and only shadow patterns can be made with them. Refraction occurs because light travels at different speeds in different transparent substances. The speed of light in each transparent substance is called

Figure 1-8.—The law of refraction.

the index of refraction for that substance; for example, light travels about 1 1/2 times as fast in air as it does in glass, so the index of refraction for glass is about 1.5.

Refraction, or change of direction, always follows a simple rule.

• “In passing from one transparent substance into another of greater density, refraction is toward the normal. In passing from one transparent substance into another of lesser density, refraction is away from the normal.” In this rule the normal is defined as a line perpendicular (90°) to the surface between the mediums.

Refraction is shown in figure 1-8. The ray of light (AB) strikes the glass at an oblique angle. Since the glass is denser than air, the ray of light is bent toward the normal (RS) and emerges from the glass at (C). Upon entering the air again, the ray is bent away from normal (RS) and travels along the path (CD).

All rays striking the glass at an angle other than perpendicular are refracted. In the case of the perpendicular ray (ME) that enters the glass normal to the surface, no refraction takes place and the ray continues through the glass and into the air in a straight line.

DISPERSION

The speed of light in a medium depends on the wavelength of the light. As light enters a more dense medium, the short waves, such as blue, are slowed more than the long waves, such as red. Thus the index of refraction of a medium varies with the wavelength, and the different colors of light are bent different amounts. This changing index of refraction or the breaking up of white light into its component colors is called

Figure 1-9.—Diffraction.

dispersion. This then ties in with the previous discussion of the colors of light where we saw the way a prism creates a spectrum from white light. The prism is able to create this spectrum because of dispersion.

DIFFRACTION

We have said that light travels in a straight line. Well, that is not always true. An exception to this rule occurs when light travels close to an opaque edge. Because of the wave nature of their travel, light rays passing near an opaque edge are bent ever so slightly (fig. 1-9). This bending is called *diffraction* and is evidenced by the formation of a shadow with a fuzzy edge when light passes an opaque object. In this case, the outside edge of the shadow is light and indistinct, but it gradually darkens into the true black of the shadow that indicates that some of the light is scattered into the shadow area.

Unlike refraction, in diffraction the long wavelengths of light are bent the most.

Diffraction is important to the photographer when the light passes the edges of a lens diaphragm. When the lens diaphragm is opened fully, the amount (actually the percentage) of diffracted light is quite small. But when the diaphragm is closed to a small opening, the percentage of diffracted light is quite large and reduces the sharpness of the image formed by the lens. In other words, a small aperture opening interferes with the image-forming light more than a large aperture does.

POLARIZATION

Energy in the form of wave motion radiates from its source and travels through a medium. For example,

Figure 1-10.—Controlling polarized light.

when a section of line is secured at one end and the free end is held in your hand and given a shake, a wave travels down the length of the line from the end that was shaken to the secured end just like an oscillator. A light source acts as an oscillator. The wave motion in the line, however, does not represent the true wave motion of light because light waves move in all possible directions at right angles to their direction of travel. A much clearer picture of light wave motion can be seen by having a number of parallel lines with each one being shaken in a different direction—one up and down, one sideways, and the others at various angles in between.

Ordinarily, light waves vibrate in all directions at right angles to their direction of travel. However, when light waves strike a series of parallel microscopic slots,

all the light that passes through vibrates in one direction. This is *polarized light*. Filters that polarize light, termed *polarizing filters*, have a practical use in photography (fig. 1-10).

Specular reflected light, from a nonmetallic surface at any angle between 32° and 37° , is polarized in such a manner that the light rays vibrate in a direction parallel to the reflecting surface. Light reflected in this manner is said to be *plane polarized* and is seen as glare (fig. 1-11). There is no polarization whatsoever produced by reflections from metallic surfaces.

LIGHT SOURCES

In the beginning of photography, daylight, or sunlight, was the only light source suitable for exposing the slow film available at that time. Today, photographic film is not only vastly more sensitive to light, but a wide range of light sources have been developed for the needs of the photographer. These light sources include the following: tungsten lamps, tungsten-halogen lamps, fluorescent lamps, and electronic flash.

DAYLIGHT

Sunlight, of course, is the light photographers are most familiar with and for good reason. It is the light they use the most. Naturally, sunlight is the only practical light source for general outdoor photography. Artificial light sources, however, can provide useful supplementary lighting to sunlight as fill-in for shadows (to make them lighter) and take the place of sunlight entirely for photography of small areas and close-ups. Sunlight is often referred to as daylight. The term *daylight*, as used in photography, is meant to include all

Figure 1-11.—Light, plane polarized by reflection.

Figure 1-12.—Effects of sunlight passing through the atmosphere.

forms of light, direct or indirect, that originate from the sun.

Of importance to the photographer is the effect of the atmosphere on sunlight and the amount of atmosphere through which sunlight passes (fig. 1-12).

The shorter wavelengths of light (violet and blue) are scattered by the atmosphere much more than the longer wavelengths. The color composition of sunlight becomes increasingly deficient in blue the further the light has to travel through the atmosphere (early morning and late afternoon). As the sunlight becomes more deficient in blue, it appears more yellow. The amount of scattering also depends on the condition of the atmosphere. When the atmosphere is clean (has little moisture or fine dust in it), there is less scattering than when the atmosphere is hazy or dirty (having a good deal of moisture or fine dust and smoke). The variation in color of sunlight can be expressed as color temperature. Sunlight coming from overhead on a clear day has a color temperature of about 5400 K. Just after sunrise and just before sunset, the color temperature ranges between 2000 K and 4000 K. Not only is the color of sunlight different early in the morning and late in the afternoon, but the intensity is also less. These are important considerations when taking pictures at these times of day.

Light scattered by the atmosphere, or *skylight* as it is called, can be regarded as a second source of light. Skylight is different than sunlight because it is caused chiefly from the scattering of the shorter wavelengths. It therefore appears more blue than sunlight. Skylight on a clear day may be as high as 60000 K.

ARTIFICIAL LIGHT

The types of artificial lighting you use in photography give you complete control over the direction, quality, and strength of the light. You can move these light sources around, diffuse them, or reflect them. You can alter their intensity to suit the situation.

There are two types of artificial light sources: *spotlights* and *floodlights*. Spotlights provide a concentrated beam of light. Floodlights give diffused, softer, more even, spread out light. You can add to these two basic types of artificial light sources. By using lighting accessories, such as reflectors, barn doors, diffusers, and snoots, you can control the light to provide a variety of lighting effects.

Unless special effects are wanted, artificial light sources that are different in color temperature or quality should not be mixed (used together). When you are viewing a scene, your eyes adapt so color differences between two or several light sources are minimized. Color film, however, cannot adapt and shows the color difference in parts of the scene illuminated by different light sources.

Tungsten-Filament Lamps

Tungsten light color films are made to be used with tungsten-filament light sources and are color balanced for 3200 K or 3400 K. Tungsten lamps, operated at their rated voltage, produce light of 3200 K and 3400 K. The color temperature of tungsten lamps changes with voltage fluctuations, decreasing with lower voltage and increasing with higher voltage. For example, the color temperature of a tungsten lamp rated for operation at 115 volts increases about 10 K for each 1 volt increase. Usually, a variation of less than 100 K has no adverse effect on the rendering of scene colors. However, a shift as low as 50 K can be noticeable on subjects with important neutral areas, such as white and light shades.

When you are using tungsten lamps, the color temperature can shift, depending on the amount of power being drawn on the same circuit. When possible, you should avoid having other equipment on the same circuit. For these lamps to produce light of the correct color, they must be operated at exactly their rated voltage. When it is not possible to operate the lamps at their proper voltage appropriate filters can be used to correct the color of the light reaching the film.

Tungsten-Halogen Lamps

Tungsten-halogen lamps have a tungsten filament inside a quartz envelope. This type of lamp does not blacken the inside of the envelope and operates at an almost constant brightness and color temperature throughout its life. Tungsten-halogen lamps for photography operate at color temperatures of 3200 K and 3400 K. Filters can be used to convert them to *daylight*. For its size, a tungsten-halogen lamp generally delivers more light than a conventional 3200 K lamp. Tungsten-halogen lights are becoming more popular and are rapidly replacing regular tungsten lights for general photographic use.

Fluorescent Lamps

Pictures made on *daylight* type of color films under fluorescent lights without a filter may be acceptable; however, they usually have a greenish cast. When a *tungsten* type of color film is used with a fluorescent lamp without a filter, the pictures usually are too blue.

Fluorescent light is not generated by heat, as are other types of light. It has special characteristics different from either daylight or tungsten light. Fluorescent lights have no true color temperature, but a value of approximate color temperature has been worked out.

- Daylight fluorescent lamps: 6500 K
- Cool, white fluorescent lamps: 4500 K
- Warm, white fluorescent lamps: 3500 K

Electronic Flash Lamps

Electronic flash is an excellent light source for both outdoor and indoor photography, especially when the predominant lights are fluorescent. Electronic flash uses a discharge tube filled with xenon gas and is supplied with a powerful charge of electricity from a capacitor. The flash is *triggered* by means of an electrical current that ionizes the gas. The output, or intensity of the flash, is usually given in effective candlepower-seconds and depends on the voltage and size of the capacitor. The design of the reflector on an electronic flash has a direct relationship on the efficiency of the unit.

Electronic flash resembles daylight in color quality and is excellent for exposing daylight type of color films. The duration of the flash is short, usually 1/500 second or less. With a computerized (automatic) unit used close to the subject, the flash duration can be as

Figure 1-13.—A lamp reflector can increase the intensity of light reaching the subject.

short as 1/50,000 second. Computerized electronic flash units have a sensor that switches off the flash when the subject (depending on its distance and tone) has received enough light for proper exposure.

Reflectors

Two types of reflectors are of importance in photography. They are the *lamp reflector* and the *plane reflector*. The first type, the lamp reflector, is used with artificial light sources—tungsten, tungsten-halogen, fluorescent, and electronic flash lamps to direct the light. The second type, the plane reflector, is used to *redirect* light from any kind of light source into shaded areas to soften or lighten shadows. (While it is true that mirrors are also reflectors, *reflector* is used in photography as a more general term. Mirrors always reflect specular light; and reflectors reflect either specular or diffused light.)

LAMP REFLECTORS.—Light emitted by the filament of a lamp is dispersed in all directions. This is useful when the lamp is for general illumination, such as one suspended from the ceiling to light a room. As a photographer, however, you are usually interested in illuminating only a given area, and it is, therefore, to your advantage to concentrate the light emitted by a lamp onto the area of interest. You can do this by mounting the lamp in a concave reflector that reflects almost all the light onto the area to be photographed (fig. 1-13). Lamp reflectors generally have a satin or matte finish to diffuse the reflected light to prevent hot spots that could result if the reflector surface were highly polished.

Reflectors of electronic flash units vary considerably in their efficiency and covering power at

Figure 1-14.-The position of the discharge tube in relation to the reflector.

different distances from the subject. Generally, they are designed to provide maximum efficiency at distances of from 6 to 12 feet from the subject. Professional type of electronic flash units may have a dual reflector system—one position for a normal angle and the other for a wide angle (for a wide-angle lens); others may have a zoom system to provide optimum light distribution for any lens within a wide range of focal lengths. Depending on the position of the discharge tube in relation to the reflector, the unit can be used as a spotlight or floodlight (fig. 1-14).

PLANE REFLECTORS.—When you want to provide fill-in light for shadow areas, it is often desirable to substitute a plane reflector (sometimes called a reflector board) to redirect the light from a direct light source (fig. 1-15). The plane reflector is placed so it receives light from the primary light source and reflects the light into the shadows. The efficiency of such a reflector depends on its surface and tone, as well as size and distance from the subject being photographed. The subject area covered by a plane reflector depends on the size of the reflector. When the surface of the reflector is matte or textured, it reflects diffused light and some of the reflected light is dispersed over a wide angle.

OPTICAL PRINCIPLES

Cameras have optical systems, or lenses, made up of several separate pieces of glass, called *elements*. There are two reasons for having several elements. First, it allows the designer to make many different types of lenses to suit different purposes. Second, the quality of the image formed by the lens can be controlled by choosing different lens elements. The most important choices the lens designer makes are the shape and position of each lens element. These govern properties like focal length, angle of view, physical weight, and size.

Lenses are probably the least understood but the most discussed component of the photographic process. Photographers (generally amateurs) speak of a lens formula as if they knew what it was about. Even if the designer's formula were made available, it would not provide information about the lens photographic quality. A perfect lens cannot be made. A lens is a compromise of inherent errors called *aberrations*, but do not let this worry you. Lens aberrations are defects in the formation of an optical image. Today's lenses are so highly corrected for lens aberrations that, except for a few ultra wide-angle (fisheye) lenses, you would be hard pressed to find a lens that produces subjectively identifiable

Figure 1-15.—Plane reflector and subject coverage.

aberrations. You may hear photographers talking about aberrations as if they were important. They may make an interesting subject, but knowing all the details about them does not help you to take better photographs. Important matters that will improve your skill as a photographer are knowing how to control the factors, such as exposure, composition, lighting, and lab work. Let the lens designers and manufacturers worry about the lens aberrations. However, just so you know what these lens aberrations are, a brief definition is provided for each of them in the glossary; they are as follows:

- Astigmatism
- Chromatic aberration
- Coma
- Curvilinear distortion
- Spherical aberration

Today's lenses can image more detail than present film materials can record. Therefore, avoid discussing *lens* resolution. If you want to discuss resolution, talk *film* resolution.

PRINCIPLE OF A LENS

The purpose of a camera lens is to control the light rays entering the camera. The simplest kind of lens is a pinhole in a piece of thin metal or black paper. Of course, only an extremely small part of the light reflected by a

subject passes through the pinhole and enters the camera. When the pinhole is large, it allows more light rays to enter but blurs the image. This blur is really an overlapping of several images. Images produced by large and small pinholes are the same size, but one is blurred, while the other is sharp. A photographic lens is a piece of polished and carefully shaped glass that *refracts* light rays so an image of a desired scene is formed on the rear wall of a camera. A lens transmits more light than a pinhole. It increases the brightness and improves the sharpness of an image. The basic principle of a lens—any lens—is relatively simple.

First, consider an image formed with a single pinhole. Next, consider another pinhole above the first. This pinhole forms a second image. When these two images could be made to coincide, the result would be an image twice as bright as the original. Now, consider a third pinhole on the side of the first, a fourth on the other side, and a fifth below the first. All four pinholes project separate images slightly removed from the first or center one. When these four images are made to coincide with the center one, the result is an image five times as bright as the image made by the one center pinhole. By using the principle of refraction, you can make these four images coincide with the center one. By placing a prism behind each pinhole, you are causing the light that forms each of the four images to be refracted and form a single image. In other words, the more pinholes and prisms used, the brighter or more intense the image. A lens represents a series of prisms

incorporated in a single circular piece of glass (fig. 1-16).

CHARACTERISTICS OF LENSES

There are several factors that must be included when you are considering the characteristics of lenses. To perform well as a Navy photographer, you must recognize the effect of these lens characteristics. Realize also that it is the recognition and use of these various lens features and/or qualities that can make the difference between good and poor photography. You must learn to recognize the photographic effect of these characteristics and be able to apply them to produce top quality photography. Finally, you must learn how some of the lens characteristics may limit photographic quality or operational capability.

Lens Focal Length

In photography, lens focal length is the distance between the optical center of a lens and the focal plane (film plane) of the camera when the lens is focused at infinity (fig. 1-17). To understand this definition, you must fully understand the terms *focal plane*, *optical center*, and *infinity*.

Figure 1-17.—Focal plane and optical center.

Figure 1-18.—Effects of lens-to-subject distance on light rays.

- ◆ **Focal plane**—The surface (plane) on which an image transmitted by a lens is brought to sharp focus; the surface or area at the back of the camera occupied by the film.

- **Optical center**—The optical center of a lens is a point, usually (although not always) within a lens, at which the rays of light from two different sources entering the lens are assumed to cross.

- ◆ **Infinity**—This term is not easily described. When light is reflected from the point of an object, the closer the point is to the lens, the greater is the angle of the spread of light rays from the object (fig. 1-18). As the

Figure 1-19.—Image size and coverage as compared to the lens focal length.

object point gets farther away from the lens, the angle of spread becomes less and less until a distance is reached at which the rays from a single point, for all practical purposes, can be considered parallel. This distance is known by the term *infinity*. For all practical purposes, light rays from a distant object or an object at 600 or more feet away may be considered to be parallel. But this is only for practical purposes. When very long focal-length lenses or telephoto lenses are being considered, the distance of 600 feet may be much less than infinity. In other words, infinity is a distance so far removed from the camera lens that the rays of light reflected to the lens from a point at that distance may be regarded as parallel. Infinity is expressed by the symbol ∞ and is a setting on a camera focusing scale.

The manner in which light rays are refracted by a lens determines the focal length. This refraction, in turn, depends on the nature of the glass used in the elements, the curvatures of the element surfaces, and the separation of the elements. The first two factors are fixed quantities once the lens is manufactured, but the third factor may be changed individually in certain lenses.

In *zoom lenses* the distance separating the lens elements can be changed. In convertible lenses, portions or elements of the lens can be used by themselves. In either method, the focal length of the lens can be changed. When one of these two conditions cannot be met, the focal length is fixed and constant.

Photographic lenses are measured according to their focal length which is normally imprinted somewhere on the lens mounting (usually the front surface of the lens barrel). This focal length information is sometimes given in inches, sometimes in millimeters, and occasionally in both systems. Focal length is frequently used to indicate the size of a lens. Thus, a lens labeled as an 8-inch lens indicates that when it is focused on a point at infinity, the distance from its optical center to the focal plane is 8 inches.

The focal length of a photographic lens dictates the size of the image produced by the lens at a given lens-to-subject distance. Focal length also determines the minimum distance between the lens and the focal plane. The normal focal length of a lens (normal lens) for a camera is approximately equal to the diagonal dimension of the film being used. Since the diagonal dimension of a 4x5 film is 6.4 inches, a lens about 6 inches is a normal lens for such film.

Lenses with a longer than normal focal length may be used on a camera, provided the distance from the lens to the film can be increased sufficiently to accommodate

the increase in focal length. Lenses shorter than the normal focal length may also be used, provided they are designed to meet the constraints of the camera and film size.

FOCAL LENGTH AND IMAGE SIZE.—When you photograph the same object at the same distance, a lens with a long-focal length produces a larger image than one with a short-focal length. In effect, the longer focal-length lens magnifies or brings the subject closer to the camera without changing the camera-to-subject distance (fig. 1-19). For example, a man 6 feet tall stands at a distance of 25 feet from three cameras, one equipped with a 6-inch lens, one with a 12-inch lens, and one with a 24-inch lens. The 6-inch lens produces a 1 1/2-inch image of the man. The 12-inch lens produces an image that is 3 inches high. The 24-inch lens produces a 6-inch image. From this example, it is obvious that the longer the focal length of the lens, the larger the image size of a given object from a given lens-to-subject distance.

FOCAL LENGTH AND SUBJECT COVERAGE.—Focal length and subject coverage go hand in hand—just as do focal length and image size. But, whereas image size increases with increased focal length, coverage decreases with increased focal length. We can consider coverage as the amount of subject matter included in a given format film size from a given lens-to-subject distance. With two cameras—each with a different focal-length lens—at the same distance from the same subject, the camera with the shortest focal-length lens includes the greatest subject area—the camera with the longest focal-length lens the least subject area (fig. 1-20).

Angle of Field.—The focal length of a lens is a determining factor in the coverage of that lens. The maximum coverage at the focal plane of a lens is expressed in degrees as the *angle of field*. Angle of field is the widest angle at which light entering a lens produces a usable portion of the *circle of illumination* at the focal plane. Light around the edges of the entire circle falls off in intensity before disappearing completely. The usable portion of this circle is called the *circle of good definition*.

The maximum size of film you can use with a lens depends on the angle of field because any part of the film outside the circle of good definition produces an indistinct image.

Angle of field is a basic optical condition that is approximately equal for all normal focal-length lenses. A normal lens, as it is called, has an angle of field of about 45 degrees to 55 degrees. This angle of field

Figure 1-20.—Subject coverage compared to the lens focal length.

Figure 1-21.—Angle of field.

closely resembles the central vision coverage of the human eye. Wide-angle lenses have a large or wide angle of field. Long focal-length lenses (often called telephotolenses) have a narrow angle of field (fig. 1-21).

Angle of View.—Angle of view determines the coverage of a lens with a particular size of film, with the lens-to-film distance remaining unchanged. Angle of view is an angle with the intercept point at the lens and its sides matching the corners of the film.

The angle of view (fig. 1-22) of a normal focal-length lens with a given film size can approach but never exceed the angle of field of the lens. Any lens recording an angle greater than 55 degrees with a given film size has a short-focal length and is called a wide-angle lens. Any lens with an angle of view less than 45 degrees with a given film size has a longer focal length.

Lens Diaphragm

The diaphragm of a lens is an opening in the lens that allows light to pass through it to expose the film (or other recording medium). This opening can be made larger or smaller to allow more or less light to pass through the lens. When the diaphragm opening is very

Figure 1-22.—Angle of view.

large, only the object that the lens is focused on is in sharp focus. As the diaphragm opening is reduced (made smaller), more objects in a scene, both in front and behind the point of focus become sharper. The lens diaphragm is used in conjunction with the shutter of the camera to control the amount of light to expose the film.

PERSPECTIVE

The human eyes see objects in three dimensions, but a lens reproduces a view in two dimensions. The missing dimension, depth, is suggested by the relative size and position of the various objects in a picture. *Perspective*, which is the relationship of objects in a photograph, affects the naturalness of a picture. Good perspective represents objects as they actually appear to human eyes.

Since wide-angle lenses take in a greater area, most photographers use them to photograph in tight quarters. And they use long-focus (long focal length) lenses to bring distant objects closer. This is fine, but it is only part of the story. Lenses of different focal length are also used to control perspective.

Perspective is NOT dependent on the focal length of the lens. It is a function of camera-to-subject distance. But a choice of lenses of a different focal length does enable you to get the desired image size at the selected distance for best perspective. For example, suppose you come across a placid farm scene. A rustic rail fence is in the foreground, and a cow is munching on a haystack in the field. The cow and her lunch are 100 feet behind the fence; you are 10 feet in front of the fence. The fence is essential to your picture and you use a 50mm lens. The result! The cow is 110 feet from the camera and is too small in relation to the fence. Your picture is a flop. Now change your perspective. Back up 40 feet from the fence

and use a 200mm lens. The fence at this distance, with the 200mm lens, is the same size as it was at 10 feet with the 50mm lens. The cow is now 140 feet from the camera, but her image is four times larger. In the photograph, it looks as if she were only 35 feet away or 25 feet behind the fence. The results! An interesting picture and pleasing composition. Choosing viewpoint and then selecting focal length for image size is one of the most important functions you should consider when selecting lens focal length.

HOW TO USE LENSES

Today, the Navy photographer is applying photography to the ever-widening specialized and technical fields within the modern Navy. This has led to greater emphasis on the correct and accurate use of the most important part of the camera—the lens. The higher standards of picture quality and the greater interest in picture taking regardless of lighting conditions, all demand more attention to the correct use of lenses. No matter how good the quality of the lenses, if photographers do not use them correctly, they will not do us or the Navy any good.

f/stop of a Lens

To use lenses correctly, the photographer must understand the relationship between the aperture of a lens and the brightness of the image produced at the focal plane. The *aperture* of a lens is simply the opening through which light passes. The aperture is controlled by an adjustable diaphragm or iris. Each setting of the diaphragm is called an *f/stop* and is always read as a number, not as a fraction or true ratio. It is referred to as the f/stop or the f/stop of the diaphragm opening. This value is designated by a lowercase f with a slant (/) between the f and the value. For example, f/8 means that the diameter of the opening in the diaphragm is one eighth of the lens focal length, but only “when the lens is focused on infinity.” In this example f/8 is the effective aperture. If the lens were focused at other than infinity, f/8 would then be the *relative* aperture. In the study of the relationship between aperture and image brightness, the term *relative aperture* is used frequently. The term *relative aperture* then refers to the ratio between the *effective aperture* of the lens and its focal length. The relative aperture of a lens is controlled by two factors: (1) the diameter of the beam of light passed by the lens; and (2) the focal length of the lens, which governs the size of the area over which the light is spread.

f/stop Applications

The formula to determine the f/stop of a lens is as follows:

$$f = \frac{F}{D}$$

Where:

F = focal length

D = diameter of the effective aperture

f = f/stop, or the relative aperture

EXAMPLE: To find the f/stop of a lens that has a focal length of 8 inches and the diameter of the effective aperture is 2 inches, use the formula below.

$$f = \frac{F}{D}$$

$$f = \frac{8}{2} \text{ or } f = 4$$

Therefore, the lens has a relative aperture of f/4.

When the diameter of the opening (aperture) of the lens is made smaller, less light is admitted and the image formed by the beam of light passing through the smaller opening becomes dim. As the size of the opening is reduced, the ratio between the aperture and the focal length increases. Thus an inverse relationship exists between the E/number and the relative aperture; as the f/stop becomes larger, the size of the relative aperture decreases.

Since the f/stop is a ratio of focal length to the lens diameter, all lenses with the same f/stops regardless of focal length provide the same amount of light on the focal plane; that is, when all the other factors that affect image brightness remain constant (fig. 1-23).

DIAPHRAGM

There is in every lens assembly a mechanical device for controlling the amount of light that passes through the lens. This mechanism may have a fixed size, or it may be designed to provide a selection among a number of sizes that can be given to the aperture in a lens. This device is a *diaphragm*, and its scale increments are called f/stops (fig. 1-24). It is located within the lens to cut off or obstruct the marginal light rays while permitting the more central rays to pass. Most lenses have a series of thin metal leaves for this purpose. These leaves are arranged and shaped to provide an approximately circular opening that can be changed in

Figure 1-23.—Equal f/stops produce equal intensities.

size, when desired, and is called an iris diaphragm. This opening is always concentric (centered) with, and perpendicular to the optical axis of the lens. Its location in the lens barrel is determined by the manufacturer when the lens is designed.

Rotating the diaphragm control ring in the direction that reduces the size of the aperture is termed *stopping down*. Moving the control ring so it enlarges the aperture

size is termed *opening up*. When the diaphragm is set at the largest aperture, the lens is said to be *wide open*. The better the quality of the optics within the lens, the larger the possible maximum aperture. The size of the largest opening is the maximum working aperture of the lens and is called the *lens speed*. The diaphragm, along with the shutter, controls the amount of light passing through a lens, and hence the exposure the film receives.

There are many different aperture sizes possible with the diaphragm, and each aperture size has a different value. Consequently, a system was devised for marking them so they could be used with consistency. The *factorial system* has become the most widely used. This system uses a set of markings commonly called the *f/system*. By using the diaphragm control ring, or lever, you can bring the index mark into line with the numbers that indicate the measured f/stop of the aperture. Remember, as these index numbers increase in size, the opening decreases in size. Furthermore, these numbers are chosen by moving the index pointer to the next larger number, and the amount of light admitted is cut in half. The first or lowest number in the series is usually an

Figure 1-24.—Iris and iris diaphragm.

exception. All these numbers may not exactly reduce the amount of light admitted by one half, but they are sufficiently close for all practical purposes. However, all of these values are in proportion to the squares of their numbers. For example, f/4 admits four times more light than f/8 because the square of f/4 is contained in the square of f/8 exactly four times. Thus,

$$4^2 = 4 \times 4 = 16$$

$$8^2 = 8 \times 8 = 64$$

$$\frac{64}{16} = 4$$

Table 1-1 shows that the amount of light admitted is inversely proportional to the square of the f/stop, while the exposure required is directly proportional to it.

EXAMPLE: The correct exposure at f/8 required 1 second. How long an exposure is required at f/16? The proportion and computation are as follows:

$$\frac{(\text{Old } f/\text{value})^2}{(\text{New } f/\text{value})^2} = \frac{(\text{Old exposure})}{(\text{Required exposure})}$$

$$\frac{8^2}{16^2} = \frac{1}{x}$$

$$\frac{64}{256} = \frac{1}{x}$$

$$64x = 256$$

$$x = 4$$

Thus the required exposure equals 4 seconds.

Table 1-1.—Comparison of f/stops with Amount of Light to Exposure Time

f/ value	f/value ² squared	Amount of light admitted	Exposure in seconds
4	16	4	1/4
4.5 (half stop)	20.25	3.2	1/3
5.6	31.36	2	1/2
8	64	1	1
11	121	1/2	2
16	256	1/4	4
22	484	1/16	8
32	1024	1/32	16

Table 1-2.—Amount of light, f/stop, and Exposure Time Relationship

f/stop	Relative exposure	Relative amount of light admitted
1	0.06	16
1.4	0.12	8
2	0.25	4
2.8	0.50	2
4	1.0	1
5.6	2.0	1/2
8	3.0	1/4
11	8.0	1/8
16	16.0	1/16
22	32.0	1/32
32	64.0	1/64
45	128.0	1/128
64	256.0	1/256

The first (lowest) f/stop marked on the lens mount is the correct value for its largest aperture. The next number is the nearest f/stop in an arbitrary series that has been adopted as a standard. In this standard series, each succeeding number going up the scale (from the largest opening to the smallest) permits only half as much light to enter the camera. Thus, as the numbers get larger, the diaphragm openings (apertures) become smaller. However, moving the index pointer in the reverse order, down the scale (from the smallest opening to the largest), the numbers get smaller and the diaphragm openings become larger. As shown in table 1-1, the *smallest number* may not admit exactly twice as much light as the next larger number. Nevertheless, the amount of light admitted remains inversely proportional to the square of the f/stop, and the exposure required is always directly proportional to it.

All lenses are indexed with the standard series of f/stops either completely or in part—except for the first f/stop (as stated earlier) that is computed to indicate the correct value of the maximum aperture. The photographer should become acquainted with this series, so its relative values are known. The following table is a listing of the f/stop, better known as the standard full stops. A comparative exposure based on 1 second at f/4 or 16 seconds at f/16 is also shown (table 1-2).

By studying the table, you can see that when the lens aperture is opened one full stop, the amount of light transmitted is twice that of the nearest preceding stop. And altering the f/stop one full stop less (stopping down) reduces the amount of light passing through the lens to one half that of the nearest larger stop.

In summary then:

- Light passes through an opening (aperture) of the lens. The diameter of the aperture can be changed. The openings are called f/stops. The f/stops indicate to the photographer that a lens (any lens) with a specific f/stop allows a given amount of light to the film. Thus a 12-inch focal-length lens set at f/4.5 gives the same exposure as a 6-inch focal-length lens set at f/4.5.

- The f/stops represent a fraction of the focal length of the lens for a given lens; that is, an f/4 lens has an effective maximum opening of one fourth of its focal length.

- From one full f/stop to the next full f/stop, there is a constant factor of two. As the opening changes from f/8 to f/11, the light passing through the lens is reduced by one half because the larger f/stop (f/11) is a smaller aperture. When the aperture is changed from f/8 to f/5.6, the light passed is doubled because the aperture has been made larger.

Figure 1-25.—Subject distance and focus.

f/stops Functions

f/stops have three functions:

1. They act as a partial control of exposure (the other exposure control is the shutter).
2. They help control depth of field.
3. They allow the photographer to adjust the aperture to the point of best definition of the lens, sometimes called the optimum or critical aperture.

Each of these functions is discussed in this chapter.

Focusing

A lens, at a given focus setting, provides a sharp image of an object at only one distance in front of it. However, when the distance between the focal plane and the lens can be adjusted, the lens can be made to form sharp images of objects located at differing distances in front of it. Therefore, to get a sharp image of a subject at a given distance, you must adjust the lens to the appropriate distance from the film plane. This adjustment is known as focusing.

In focusing a camera lens, the nearer the subject is to the lens, the farther behind the lens the image is formed. For close subjects, the lens must be moved away

from the film plane to focus the image; and the farther away the subject is from the lens, the closer to the lens the film plane must be (fig. 1-25).

INFINITY FOCUS.—When the lens is focused on an object so distant that the light rays reflected from it are parallel, these rays converge (after refraction by the lens) at the *point of principal focus*. The point of principal focus is on the *principal focal plane*; that is, at a distance of one focal length behind the lens. Therefore, the lens is said to be on infinity focus.

When the distant object is moved nearer to the lens or the lens is moved closer to the object, the distance between the focal plane and the lens must be increased to keep the image in sharp focus. When the distance between the lens and focal plane is not extended as the object is moved nearer to the lens, the image of the object becomes blurred or out of focus. The closer the lens is to the object it is focused upon, the larger the image becomes until the distance between the lens and the focal plane is extended to twice the focal length of the lens. At this distance, the image and the object focused upon are the same size. Therefore, the size of an image formed by a lens is dependent upon two factors: the distance from the lens to the object focused upon and the focal length of the lens.

Light coming from the far object A passes through the lens to form a sharp image at A_1 and light coming from the nearer object C passes through the lens to form a sharp image at C_1 . To obtain a sharp image of A, move the film to A_1 or move the lens to F. To obtain a sharp image of C, move the film to C_1 or move the lens to D.

Figure 1-26.—Focusing for one object.

Figure 1-27.—Image on film in front of and in back of the point of sharp focus.

FOCUSING FOR ONE OBJECT.—Focusing is done essentially to obtain the proper distance between the lens and the film. When light rays come from a far object and pass through a lens, they form a sharp image close to the lens. When light rays come from a near object, they form an image farther away from the lens. This means that the lens must be focused on either the far or the near object, depending on which one the photographer wants to have in sharp focus. When a sharp image of the near object is desired, the lens should be focused by moving it farther away from the film. When you want a sharp image of the far object, move the lens closer to the film (fig. 1-26).

CIRCLE OF CONFUSION.—A picture is basically an accumulation of many points that are exact images of points composing the subject. After light strikes a subject, it is reflected from many points on the subject. A camera lens redirects these reflected rays into corresponding points on the film. Each of these points is reproduced by the lens as a circle. When the circle is smaller than $1/100$ inch, it appears as a sharp point to the eye. When the circle is larger than $1/100$ inch, the eye sees it as a circle, and the image is blurred or out of focus. Each out-of-focus circle on the film is called a *circle of confusion* and can be visualized as the cross section of a cone of a light ray (fig. 1-27).

Figure 1-28.—Depth of field.

When a lens is focused on an object at a certain distance, other objects, both closer and farther than the focus distance, form larger circles of confusion. When the film is placed at a point corresponding to the lens focus distance, a clear image is produced (fig. 1-28). When the film is nearer or farther away from the lens than the corresponding lens focus distance, the image becomes blurred because of the larger circles of confusion caused by the intersection of light rays either in front of, or behind, the film plane.

Another factor affecting the circle of confusion is lens aperture. Decreasing a lens opening narrows the light rays passed by the lens. The narrower these rays, the smaller the circles of confusion when the image is not in perfect focus. In practice, this means that a small lens opening is used to record, as clearly as possible, several objects at varying distances. Even when the rays from some objects do not intersect perfectly at the film plane, the circles of confusion ahead or behind the film are negligible and still appear as a sharp image.

The size of the permissible circle of confusion depends on the film format size and the manner in which the film will be used. Experience has shown that the permissible circle of confusion should not exceed about 1/1000 of the focal length of the lens. This is normal for the film size. The generally accepted permissible circle of confusion diameters are given in table 1-3.

The minimum circle of confusion of most lenses is small. Thus the focal plane can be moved slightly and yet retain an acceptable sharp image. However, as the distance of the movement is increased, the circle of confusion becomes greater and the image becomes less

Table 1-3.—Permissible Circle of Confusion Is Dependent on Film Size

Film Size	Diameter (inches)
16mm	0.0010
35 mm	0.002
2 1/4 x 2 3/4"	0.004
4 x 5"	0.006
8 x 10"	0.012

Figure 1-29.—Depth of focus.

sharp. Consequently, the distance that the focal plane can be moved forward or backward from the plane of sharp focus and continue to produce an image of acceptable sharpness is termed the *depth of focus*. This depth is always within the camera (fig. 1-29).

HYPERFOCAL DISTANCE.—The hyperfocal distance of a lens is the distance from the optical center of the lens to the nearest point in acceptably sharp focus when the lens, at a given f/stop, is focused at infinity. In other words, when a lens is focused at infinity, the distance from the lens beyond which all objects are rendered in acceptably sharp focus is the hyperfocal distance. For example, when a 155mm lens is set at f/2.8 and focused at infinity, objects from 572 feet to infinity are in acceptably sharp focus. The hyperfocal distance therefore is 572 feet.

The following equation is used to find hyperfocal distance:

$$H = \frac{F^2}{f \times C}$$

Where:

H = hyperfocal distance

F = focal length of lens

f = f/stop setting

C = diameter of circle of confusion

F and C must be in the same units, inches, millimeters, and so forth.

NOTE: 1 inch is equal to 25.4mm.

Where:

F = 155mm (6.1 inches)

f = 2.8

C = 0.05 (0.002 inches)

Then:

$$H = \frac{6.1^2}{2.8 \times 0.002} = 6650 \text{ inches} = 554 \text{ feet}$$

Thus the hyperfocal distance for this lens set at f/2.8 is 554 feet.

Hyperfocal distance depends on the focal length of the lens, the f/stop being used, and the permissible circle of confusion. Hyperfocal distance is needed to use the maximum depth of field of a lens. To find the depth of field, you must first determine the hyperfocal distance. By focusing a lens at its hyperfocal distance, you cause the depth of field to be about one half of the hyperfocal distance to infinity.

DEPTH OF FIELD.—Depth of field is the distance from the nearest point of acceptably sharp focus to the

farthest point of acceptably sharp focus of a scene being photographed. Because most subjects exist in more than one plane and have depth, it is important in photography to have an area in which more than just a narrow, vertical plane appears sharp. Depth of field depends on the focal length of a lens, the lens f/stop, the distance at which the lens is focused, and the size of the circle of confusion.

Depth of field is greater with a short-focal-length lens than with a long-focal-length lens. It increases as the lens opening or aperture is decreased. When a lens is focused on a short distance, the depth of field is also short. When the distance is increased, the depth of field increases. For this reason, it is important to focus more accurately for pictures of nearby objects than for distance objects. Accurate focus is also essential when using a large lens opening. When enlargements are made from a negative, focusing must be extremely accurate because any unsharpness in the negative is greatly magnified.

When a lens is focused at infinity, the hyperfocal distance of that lens is defined as the near limit of the depth of field, while infinity is the far distance. When the lens is focused on the hyperfocal distance, the depth of field is from about one half of that distance to infinity.

Many photographers actually waste depth of field without even realizing it. When you want MAXIMUM depth of field in your pictures, focus your lens on the hyperfocal distance for the f/stop being used, NOT on your subject which of course would be farther away than the hyperfocal distance. When this is done, depth of field runs from about one half of the hyperfocal distance to infinity.

There are many times when you want to know how much depth of field can be obtained with a given f/stop. The image in the camera viewing system may be too dim to see when the lens is stopped down. Under these conditions, some method other than sight must be used to determine depth of field. Depth of field can be worked out mathematically.

The distance, as measured from the lens, to the nearest point that is acceptably sharp (the near distance) is as follows:

$$ND = \frac{H \times D}{H + D}$$

The distance, as measured from the lens, to the farthest point that is acceptably sharp (the far distance) is as follows:

$$FD = \frac{H \times D}{H - D}$$

ND = near distance

H = hyperfocal distance

D = distance focused upon

FD = far distance

EXAMPLE: What is the depth of field of a 155mm (6.1 inch) lens that is focused on an object 10 feet from the camera lens using f/2.8? (Note: In a previous example the hyperfocal distance for the lens was found to be 554 feet.) By the formula, the nearest sharp point is determined as follows:

$$ND = \frac{H \times D}{H + D}$$

$$ND = \frac{554 \times 10}{554 + 10} = \frac{5540}{564} = 9.8$$

$$ND = 9.8 \text{ feet}$$

Thus the nearest point in sharp focus is 9.8 feet from the lens that is focused on an object at 10 feet, using f/2.8.

Also by the formula, the farthest point in sharp focus can be determined as follows:

$$FD = \frac{H \times D}{H - D}$$

$$FD = \frac{554 \times 10}{554 - 10} = \frac{5540}{544} = 10.2$$

$$FD = 10.2 \text{ feet}$$

Therefore, the far point in sharp focus is 10.2 feet when focused on an object at 10 feet, using f/2.8. Consequently, the depth of field in this problem equals the near distance subtracted from the far distance (10.2 - 9.8 = 0.4-foot depth of field). Thus all objects between 9.8 and 10.2 feet are in acceptably sharp focus. When this depth of field is not great enough to cover the subject, select a smaller f/stop, find the new hyperfocal distance, and apply the formula again.

When the only way you have to focus is by measurement, the problem then becomes one of what focus distance to set the lens at so depth of field is placed most effectively. There is a formula to use to solve this problem.

$$P = \frac{D \times d \times 2}{D + d}$$

Where:

D = distance to farthest point desired in sharp focus

d = distance to nearest point desired in sharp focus

P = distance to point at which the lens should be focused

Substituting the figures from the previous examples,

$$D = 10.2 \text{ feet}$$

$$d = 9.8 \text{ feet}$$

$$P = \text{lens focus distance}$$

Then:

$$P = \frac{10.2 \times 9.8 \times 2}{10.2 + 9.8} = \frac{200}{20} = 10 \text{ feet}$$

$$P = 10 \text{ feet}$$

To obtain the desired depth of field at f/2.8, we set the lens focus distance at 10 feet.

If the preceding explanations and formulas have confused you, here is some good news! Most cameras and lenses have depth of field indicators that show the approximate depth of field at various distances and lens apertures. Figure 1-30 shows that with the lens set at f/8 and focused at about 12 feet, subjects from about 9 feet to about 20 feet are in acceptably sharp focus. By bringing the distance focused upon to a position opposite the index mark, you can read the depth of field for various lens openings.

Keep in mind that a depth of field scale, either on the camera or on the lens, is for a given lens or lens focal length only. There is no universal depth-of-field scale that works for all lenses.

In conclusion, the two formulas used to compute depth of field serve for all distances less than infinity. When the lens is focused on infinity, the hyperfocal distance is the nearest point in sharp focus, and there is no limit for the far point.

CONJUGATE FOCI

Object points and their corresponding image points formed by a lens are termed *conjugate focal points*. The distances from the optical center of the lens to these points, when the image is in focus, are termed *conjugate focal distances* or *conjugate foci* (fig. 1-31).

Figure 1-30.—Depth of field on camera focusing ring.

302.15

The terms *object focal distance* and *image focal distance* are often used for these conjugate distances. It is obvious from these two terms that the object distance is outside the camera and the image distance is inside the camera. Since the focal length denotes only the distance from its center to the image when focused at infinity, we need some way to account for the fact that when we focus on closer objects the image focal distance can be much more than the lens focal length, with a corresponding effect on image size, effective aperture, and other factors.

The various ratios between image and object focal distances may be determined by a formula that contains the focal length of the lens and the ratio (scale) between the image size and the object size.

That is:

F = the focal length of the lens

R = the ratio between the image and object size
or the ratio between the conjugate foci of
the image and object

When R is determined by the following formula:

$$R = \frac{\text{Image size}}{\text{Object size}}$$

$$\text{Object focal distance} = F + F \div R$$

$$\text{Image focal distance} = F + (F \times R)$$

For a 1: 1 reproduction using a 50mm lens, your object focal distance is as follows:

$$50\text{mm} + \frac{(50\text{mm})}{1} = 100\text{mm}$$

and the image focal distance is as follows:

$$50\text{mm} + (50\text{mm} \times 1) = 100\text{mm}$$

When the image formed by a lens is smaller than the object, the larger conjugate is outside the camera. When the image formed is larger than the object, the larger conjugate is inside the camera.

These conjugate focal distances have some interesting relationships that may be used in several ways. The following examples illustrate the practical value of these distance relationships:

EXAMPLE 1: A4x5-inch copy negative must be made of a 16x20 print using a camera equipped with a 10-inch focal length lens.

Figure 1-31 .—Conjugate distances.

PROBLEM: Determine the distance that is required between the film and the lens (the image focal distance) and the necessary distance between the lens and the print (the object focal distance).

The ratio between the film size and the print size (4:16 or 5:20) may be reduced by using the following formula:

$$R = \frac{4}{16} = \frac{1}{4}$$

Likewise:

$$R = \frac{5}{20} = \frac{1}{4}$$

Substituting the figures into the formula:

$$\begin{aligned}\text{Object focal distance} &= F + (F \div R) \\ &= 10 + (10 \div 1/4) \\ &= 50 \text{ inches}\end{aligned}$$

$$\begin{aligned}\text{Image focal distance} &= F + (F \times R) \\ &= 10 + (10 \times 1/4) \\ &= 12.5 \text{ inches}\end{aligned}$$

Therefore, the camera lens must be 50 inches from the print and the film must be 12.5 inches from the lens to make a 4x5-inch image of a 16x20 print using a 10-inch lens.

EXAMPLE 2: Make a full-length portrait of a man 6 feet (72 inches) tall using a 10-inch focal-length lens, and make the image on the film 5 inches long.

PROBLEM: How much studio space is required to make this photograph?

The ratio is 5:72, which reduces to

$$R = \frac{5}{72} = \frac{1}{14.4}$$

Substituting the formula:

$$\text{Image focal distance} = 10 + (10 \times \frac{1}{14.4}) = 10.7 \text{ inches}$$

$$\text{Object focal distance} = 10 + (10 \div \frac{1}{14.4}) = 154 \text{ inches}$$

Adding 10.7 inches and 154 inches and converting to feet gives a film to subject distance of 13.7 feet. However, there must be enough space added to this distance to allow a background behind the subject and operating space behind the camera. Three or four feet at each end is about the minimum for good work. Thus, if

the room is not at least 20 feet long ($13.7 + 6 = 19.7$), a portrait this size cannot be made with a 10-inch lens.

EXAMPLE 3: A diagram 4 inches square is to be photographed so the image on the film is 8 inches square. Using a 10-inch lens, how much bellows extension, or camera length, is required? The ratio here is 8:4, or

$$R = \frac{8}{4} = 2$$

The image focal distance equals the bellows extension or the required length of the camera.

Substituting:

$$\begin{aligned}\text{Image focal distance} &= 10 + (10 \times 2) \\ &= 30 \text{ inches}\end{aligned}$$

If the camera does not have sufficient bellows extension to allow the film to be placed 30 inches from the lens, the required negative or image size cannot be made with this camera and lens.

It is not difficult to calculate the various distances for different jobs. The photographer also saves the time and unnecessary work usually required by the trial-and-error method.

Image/Object Relationship

The size of the image formed by a lens is dependent upon the following:

- The size of the subject
- The lens-to-subject distance
- The lens focal length

The size of the image of any object at a given distance is directly proportional to the focal length of the lens being used. That is, when a given object at a given distance appears 1 inch high on the focal plane when a 3-inch lens is used, it appears 2 inches high when a 6-inch lens is used and 1/2 inch high when a 1 1/2-inch lens is used.

The proportion illustrated in the following figure is the basis of the equation commonly used for solving image-object and focal length distance relationship problems (fig. 1-32).

Figure 1-32.—Proportional IFGA.

All image-object and focal length distance relationship problems can be computed with the following simple proportion:

The image size (I)
is to the image focal distance (F)
as the object size (G)
is to the object focal distance (A)

You should thoroughly understand this equation since you will have many uses for it in many different applications of photography.

Study the proportional IFGA figure and note the following:

I - the image size
F - the image focal distance
G - the object size
A - the distance from lens to object

The ratio of image size to image focal distance is the same as the ratio of object size to object focal distance as follows:

$$I:F = G:A$$

The mathematical equation resulting from this proportion is as follows:

$$IA=FG$$

The proportion may be written in fractional form as follows:

$$\frac{I}{F} = \frac{G}{A}$$

When solving for I:

$$I = \frac{FG}{A}$$

When solving for A:

$$A = \frac{FG}{I}$$

To clear or set apart one factor of an equation so it may be solved, divide the equation by all factors on that side of the equation except the one to be set apart.

When solving for F:

$$F = \frac{IA}{G}$$

When solving for G:

$$G = \frac{IA}{F}$$

These four formulas are from the same equation $IA = FG$.

Inches and feet are used in the equation that eliminates the computations required to reduce feet measurements to inches. However, the relation of inches to inches and feet to feet must be maintained on the respective sides of each equation. Keep I and F values in inches and G and A values in feet. Then, when solving for I or F, the result will be in inches. When solving for G or A, the result will be in feet.

In the sample problems which follow, the $IA = FG$ formula is used as though the camera were focused at infinity.

PROBLEM 1: A lens with a focal length of 12 inches is used to photograph an object 10 feet high from a distance of 30 feet. What is the size of the image? Solve for the unknown factor (image size) by substituting the known factors (focal length, object size, and distance) into the equation $IA = FG$. The formula and computations are as follows:

$$I = \frac{FG}{A}$$

$$I = \frac{12 \times 10}{30}$$

I = 4, or image size equals 4 inches

This computation can be done with lenses marked in millimeters; however, the result will also be in millimeters. At this point, you must convert millimeters to inches as follows:

$$I = \frac{305\text{mm} \times 10 \text{ ft}}{30}$$

$$= 101\text{mm} \times .04 \text{ (conversion factor)} = 4 \text{ inches}$$

Where:

I = the image size

F = the focal length

G = the object size

A = the distance from the lens to the object

PROBLEM 2: A 24-inch focal-length lens is used to photograph an object 10 feet high from a distance of 30 feet. What is the length of the image? The formula and computations are as follows:

$$I = 8 \text{ inches}$$

or, solving to prove the unit of measure of the result.

$$I = \frac{FG}{A}$$

$$I = \frac{24 \times 10}{30}$$

$$I = \frac{24 \text{ inches} \times 10 \text{ feet}}{30 \text{ feet}}$$

$$I = 8 \text{ inches or image size}$$

$$I = 8 \text{ inches}$$

As an example of a typical situation whereby you can make use of the $IA = FG$ formula, suppose you are requested to make a 9-inch photograph of a board 12 feet long. This board is mounted on a wall and the maximum distance from that wall to the opposite side of the room is 20 feet. Is it possible to make this photograph using an 8x10 camera equipped with a 12-inch focal-length lens?

The known values are object size (12-foot board), requested image size (9 inches), and the focal length (12 inches). The unknown factor is the necessary lens-to-subject distance required to make the photograph using this camera. The formula and computations are as follows:

$$IA = FG$$

$$A = \frac{FG}{I}$$

$$A = \frac{12 \text{ inches} \times 12 \text{ feet}}{9 \text{ inches}}$$

$$A = 16 \text{ feet}$$

The required lens-to-subject distance equals 16 feet. The answer to this problem then would be yes, since the required lens-to-subject distance is only 16 feet. This allows the photographer 4 feet ($20 - 16 = 4$) in which to set up and operate the camera.

PROBLEM 3: An image 4 inches long of an object 8 feet high at a distance of 20 feet is focused on the film plane. What is the lens focal length?

$$IA = FG$$

$$F = \frac{IA}{G}$$

$$F = \frac{4 \times 20}{8}$$

$$F = 10, \text{ or focal length equals 10 inches}$$

Another problem to illustrate the application of the proportion $I:F=G:A$ follows: When using an 8x10 camera equipped with a 12-inch focal-length lens to obtain a 9-inch image from a distance of 16 feet, you can photograph an object of what maximum length? To solve this problem, you should have the formula and computation as follows:

$$G = \frac{IA}{F}$$

$$G = \frac{9 \text{ inches} \times 16 \text{ feet}}{12 \text{ inches}}$$

$$G = 12 \text{ feet}$$

The maximum length of an object that can be photographed with this 12-inch lens, using an image size of 9 inches from a distance of 16 feet, is 12 feet.

Using Various Lenses

It is possible for you to take all your pictures with only one lens. But before long, you will want to expand your range of lenses to become a more versatile photographer.

Within our Navy, 35mm single-lens reflex (SLR) cameras are coming into ever-increasing use. Every Navy photo unit should have several SLR cameras, and

by and large, they are the cameras most used. For these reasons we shall limit our discussion of using different lenses to 35mm SLR cameras. Keep in mind, however, that the *concepts* discussed apply equally well to all cameras and lenses no matter what their size of focal length may be.

Lens interchangeability is one of the great features of SLR cameras. SLR cameras have focal-plane shutters directly in front of the film so the lens can be removed and replaced at any time without fogging the film. Most makes of lenses and cameras are designed with their own exclusive method of lens attachment. Some use screw-in lenses; others use bayonet mounts. And each lens is either incompatible with or requires special adapters to fit other brands.

Lenses for 35mm cameras are generally divided into two groups. The first group is a basic set of three. These are moderately wide angle, normal, and moderately long focal length. The second group is a variety of special lenses. This group of special lenses includes ultra-wide angle, extreme telephoto, shift lenses, variable focal length (ZOOM), and macro lenses.

Most experienced Navy photographers who use a 35mm camera agree that a basic set of lenses is well worth having. Their choice of actual focal-length lenses is a far more personal decision. One may prefer a 35mm wide angle and a 200mm long focal length. Another photographer may prefer a 28mm wide angle and a 135mm long-focal-length lens.

There are two occasions for changing lenses. The first is when your viewpoint or camera position cannot be changed. Imagine that you are aboard a ship and taking pictures of the coastline. To get a broader view of the coastline, you cannot move your camera position because the ship is on course. The solution is to change to a wide-angle lens. To get a closeup shot of an important section of the coastline, you obviously cannot move closer to the shore. You must change to a long-focal-length lens to bring the important section of coastline closer to you. The second time you would change lenses is when a different focal-length lens enhances your subject (remember the cow having lunch). This depends on your ability to change camera viewpoint, forward and backward, so you can fill the picture area with the subject. Using a long-focal-length lens reduces depth of field, makes the apparent effect of linear perspective less dramatic, and decreases the *apparent* distance between different subject planes.

The use of a wide-angle lens has the opposite effect. It increases depth of field, exaggerates apparent linear

Figure 1-33.—Comparison of angle of view on camera lenses.

perspective, increases the apparent distance between subject planes, and may introduce image distortion.

As the focal length increases, the image gets bigger and the angle of view becomes smaller. You cannot change the picture area produced on film by a 35mm SLR camera. The picture area is always 24mm by 36mm. Lenses for 35mm SLRs (except some ultra-wide lenses) all produce an image that completely fills the picture area. Along lens magnifies the subject image and not as much of it fits into the film frame area (fig. 1-33). Thus long-focal-length lenses cut down the area you see around the subject, and they, therefore, have a small *angle of view*.

Short-focal-length lenses produce much smaller images from the same camera position than long lenses. The small image of a subject looks farther away and much more area surrounding it can be included in the picture area. A short-focal-length lens gives a wide-angle view. This is why short-focal-length lenses are called wide-angle lenses.

Figure 1-34.—Angle of view.

In figure 1-34, the diagram shows the different angles of view you can expect from several common focal-length lenses used with 35mm SLR cameras.

Table 1-4 can be used in selecting lenses for one film format that provides the same angle of view produced by another film format and the lens focal-length combinations.

To use this table, select the lens for one film format that provides the same angle of view produced by another film format and focal-length combination. Example: The angle of view of a 360mm lens on a 4x5 camera is 19 degrees. To match the angle of view approximately with a 35mm camera, a 105mm lens is needed. The normal focal-length lens (50mm) for a 35mm camera provides an angle of view of 40 degrees (width). You can see from the table that the normal focal-length lens for a medium format camera (2 1/4" x 2 1/4") is an 80mm lens because it provides approximately the same angle of view (38 degrees).

TYPES OF LENSES

There is a large variety of lenses available for most hand-held cameras on the market today. These lenses are used for different photographic applications. The types

of lenses you may use in the fleet are as follows: wide angle, ultra-wide angle, rectilinear, macro, normal focal length, telephoto, and variable focal-length, or zoom, lenses.

Wide-Angle Lenses

Anything less than 40mm in focal length (for a 35mm camera) is considered a wide-angle lens. Again, we are speaking of the lens focal length as it applies to 35 mm cameras.

A wide-angle (short focal length) lens is designed to take in a large view and is indispensable when working in confined spaces or when you want to cover a large area. Wide-angle lenses have their own qualities, causing *apparent*, repeat, *apparent*, distortion and foreshortening of perspective, so objects close to the lens *appear* large, while background objects diminish in size dramatically.

Many photographers choose a 28mm lens for their 35mm camera wide-angle lens. This is partly because this focal length allows the typical wide-angle effects without introducing apparently distorted images, such as *bent walls*. As well as providing a wider field of view, wide-angle lenses also produce great depth of field at all apertures.

Short-focal-length lenses do not, as is often believed, actually change perspective. The close view-points allowed by wide-angle lenses can cause perspective effects that *appear* distorted but are perfectly natural ways of seeing objects at close range.

A wide-angle lens magnifies features nearest the camera. To fill the frame when photographing people with a wide-angle lens, you must move in close. This causes a distorted view. But wide-angle lenses can be used when special effects are desired, such as deliberate distortion, when exaggeration of features or when surrounding areas add to the viewer's understanding of the subject.

A lens hood, or lens shade, is an important accessory for any lens. It is especially important with a wide-angle lens. Strong light can easily cause flare when reflected internally between the elements of the lens, and unless you take proper precautions by using a lens hood, your pictures may be spoiled. Sometimes you are able to see flare or ghosting in the viewfinder, but more often than not, it is not visible to the human eye, and it only shows up on the processed film.

Another precaution to take with wide-angle lenses concerns filters and other accessories attached to the

Table 1-4.-Choosing Lenses to Match Angle of View

Film Format	Focal Length Lens (mm)	Angle of View, Long Film Dimension (degrees)	Angle of View, Short Film Dimension (degrees)
16mm	10 17 25 50 75	52 32 22 11 7.5	41 25 17 8.5 5.6
35mm	15 20 24 28 35 50 90 105 135 200 300	100 84 74 65 54 40 23 19 15 10 6.9	77 62 53 46 38 27 15 13 10 6.9 4.6
2 1/4" x 2 1/4"	30 0 50 80 120 150 250 350	85 69 58 38 26 21 13 9	85 69 58 38 26 21 13 9
4" x 5"	65 75 90 150 210 300 360	85 77 67 44 32 23 19	72 65 56 35 25 18 15
8" x 10"	165 210 300 360 420	73 61 45 38 33	61 50 36 30 26

front of the lens. When you use more than one filter or a particularly thick filter, you may end up with vignetting. This results in the edges of the image being cut off, particularly at wide apertures. When using wide-angle lenses, you should use lens hoods and filters designed for the particular lens in question.

Ultra-Wide-Angle Lenses

Many ultra-wide-angle, or short-focal-length, lenses are known as *fish-eye* lenses. These lenses have a focal length of less than about 17mm (for a 35mm camera). The ultra-wide-angle view of these lenses results in image distortion. Straight lines appear curved and curved lines may appear straight.

The use of fisheye lenses makes objects appear to diminish in size rapidly as the distance from the camera increases and objects which are close to the camera appear far apart.

Depth of field with a fisheye lens is very great. They often give depth of field that extends from only inches in front of the lens to infinity so that focusing is not necessary.

Rectilinear Lenses

A rectilinear lens, despite its wide angle, has normal rectilinear corrections so straight subject lines are straight in the image and there is no obvious distortion. The width of objects close to the camera appears emphasized because of the steep perspective produced by a rectilinear lens.

Macro Lenses

A macro lens is used for closeup photography and is a valuable lens for any imaging facility to have. These lenses come in various focal lengths and are capable of producing up to one half or even life-size 1:1 images. For example, a 100mm macro lens produces a 1:1 image just as a 50mm macro does. With a 100mm lens, you do not have to get as close to the subject. This is especially useful when you are taking pictures of live creatures or doing closeup medical photography.

Normal Focal-Length Lenses

The standard or normal focal-length lens for a 35mm SLR camera is from about 40mm to 58mm (the most common being 50mm). This focal length gives a field of view roughly the same as that over which the eye gives satisfactory sharpness—thus the name *normal*

Figure 1-35.—Arrangement of lens elements in a telephoto lens.

focal length. With a normal lens, the angle of view and the image size you see in the viewfinder are normal. That is, you get much the same impression as you would get if you look at the subject with one eye. Many Navy photographers claim, however, that the wider angle of view of a 35mm lens (for a 35mm camera) is preferable. Others maintain that an 85mm focal length is better for general use because it enables the picture space to be filled more easily with subject matter.

A normal lens can be used for making pictures of people if you do not get too close. When you fill the frame with the face of the subject, you get image distortion. It is better to stand farther back and include the shoulders of the subject in the picture. This eliminates distortion.

Telephoto Lenses

A lens with a focal length greater than about 58mm for a 35mm camera is a long-focal-length lens. Most modern, long-focal-length lenses are called *telephoto* lenses because of their compact design. At one time, long-focal-length lenses were essentially a lens at the end of a long tube. A 500mm lens was spaced 500mm from the film, and so on. However, by incorporating other glass elements, the light passing through the lens can be modified (fig. 1-35). This permits the lens barrel to be physically shorter than the lens actual focal length—an arrangement known as telephoto.

Figure 1-36.—Reflecting telephoto lens.

The overall physical length of a telephoto lens is usually only about one half of its focal length. A basic, long-focal-length lens must be placed one focal length away from the film if it is to form an image of a subject at infinity. In the case of a telephoto (or mirror) lens, the lens-to-film distance is reduced considerably while still retaining the effects of a long-focal-length lens. Thus a 1000mm telephoto lens rear element may only be 500mm away from the film when the lens is set at infinity.

Those 35mm camera lenses that range from about 85mm to 135mm are good for shooting pictures of people. They allow you to shoot from about 6 feet away and still fill the frame with the subject's face. Six feet from the subject is a good working distance. It is not too close for comfort, and it is not so far away that intimacy is lost.

Telephoto compression is the apparent compression of perspective. A telephoto lens does not compress perspective; it only appears that way! Remember, perspective does not depend on the lens being used, but on the position of the camera.

So then, how does a telephoto lens produce the effect of compressed perspective? Several factors are involved:

- ◆ A telephoto lens is used from farther away to obtain the same size image that would be produced by a shorter lens at a closer distance. The more distant camera position produces a flatter perspective. But, because the long lens magnifies the subject, it still produces a normal size image. Thus the looks are flatter than expected.

- ◆ The distance from which the print is viewed also has an effect. An X-times enlargement should be viewed from X-times the focal length of the lens used to make the picture in order for the perspective to appear natural. Therefore, a 6X enlargement of a negative shot with a 50mm lens should be viewed from $6X\ 50mm = 300mm$ or 12 inches, while a picture made with a 500mm telephoto lens and enlarged 12 times should be viewed from 20 feet ($12 \times 500mm = 600 \times 0.04 = 240 \div 12 = 20$ feet). (Note: To convert millimeters to inches, multiply the known millimeters by 0.04.)

A reflecting telephoto lens, the so-called mirror lens, has *folded up* optics. It uses internal mirrors to reflect the light twice. This enables the lens barrel to be much shorter, but because of the mirrors, it must also be much broader. As shown in figure 1-36, light that enters the lens through a glass plate is converged and reflected back by a concave mirror at the back of the lens. This reflected light is directed to a small backward-facing

JO1 Peter D. Sundberg
302.19

Figure 1-37.—Out-of-focus highlights caused by a mirror lens.

mirror lens element at the center of the front glass plate. In turn, the mirror lens reflects the light back through a hole in the concave mirror to a focus on the film.

Mirror lenses have the advantage of long focal length, relatively short physical size, and large aperture. But they also have disadvantages, the main one being that a diaphragm cannot be used and the lens must always be used at maximum aperture. Therefore, exposure must be controlled by the shutter alone or by the use of neutral density filters, or both. Because of this aperture disadvantage, mirror lenses have limited depth of field. Another disadvantage is that out-of-focus highlights record as rings of light (fig. 1-37).

Variable Focal-Length Lenses

A variable focal length, or *zoom*, lens is designed so the focal length can be changed by mechanically moving the elements within the lens. The movement of lens elements, in unison and in precise order, gives a smooth change of image size while maintaining acceptably sharp focus throughout the entire adjustment. The simplified drawing of a zoom lens (fig. 1-38) illustrates how the movement of elements within the lens can

change the focal length while maintaining correct lens-to-film distance.

While only the shortest and longest focal lengths for this particular lens are shown in the drawing, various other focal lengths are possible.

The biggest advantage of a zoom lens is that you have many focal lengths in one single lens. You do not have to change lenses to use a different focal length. Sometimes it is impossible to change your viewpoint to improve a picture. But with a zoom lens you can *zoom* in and out (change focal length) until you get the exact image you want. One disadvantage is the extra bulk and weight of the zoom lenses. There is also some loss in picture quality when compared to the performance of a fixed focal length lens. There are four basic types of wide to telephoto zoom lenses for 35mm cameras:

- *Wide-range* zoom lenses have focal lengths from about 28mm to 80mm. They often take the place of fixed focal-length lenses of 28mm, 35mm, 50mm, and 80mm.
- ◆ *Mid-range* zoom lenses have focal length that do not extend very far on either side of a normal lens focal length. Mid-range zooms for 35mm cameras have a

Figure 1-38.—Variable focal-length (zoom) lens.

variable focal length from about 35mm to 70mm. They are usually small and lightweight. They are designed to be used instead of a normal focal-length lens, not to replace a range of focal length lenses.

- *Long-range zoom lenses* start at about 35mm and include the popular 100mm or 105mm focal lengths. They can take the place of four, fixed focal-length lenses: the 35mm, 50mm, 85mm, and 105mm.

- *Telephoto-range zoom lenses* have focal lengths that range from about 50mm to 135mm, 90mm to 230mm, 75mm to 150mm, and even 135mm to 600mm.

The most popular telephoto zoom is from about 80mm to 200mm.

Now you have some basic knowledge of the way light reacts when striking various objects. You also know how it forms an image through a lens. With practice, you will be able to apply these principles in photographic practices. By using various focal-length lenses and aperture settings, you can control image size and depth of field as well as the apparent perspective of your photographs. In the next chapter, light-sensitive materials are discussed. This will enable you to record permanent images.

CHAPTER 2

LIGHT-SENSITIVE MATERIALS

Many substances are affected in some way by light. The light-sensitive substances used in photographic film to record an image are silver salts and are called **silver halides**. The silver halides react to ultraviolet radiation, violet, and blue light only; however, they can be made sensitive to other colors of light and infrared radiation by the addition of dyes. Depending on the amount of light and the type of silver halide, the light produces a visible or invisible change in the halides of a film or printing paper. An invisible change is made visible by development.

Photographic films and papers are composed of two basic parts: the emulsion and the base, or support. The emulsion is the light-sensitive portion of a film or paper that records the image. The emulsion contains the silver halides and any special sensitizing dyes suspended in a binder of gelatin. The gelatin holds the silver halides evenly dispersed and prevents action by a developer until the silver halides have been made developable either by exposure to light or chemical action. Also, the gelatin acts as a sensitizer for the silver salts.

In photographic films and papers, the primary purpose of the base is to support or hold the emulsion in place. The base, or support, may be transparent or opaque, depending upon how the recorded image is to be used. A transparent base is used for transparencies that are viewed by transmitted light and for negatives that are printed with transmitted light. An opaque base is used for prints that are viewed by reflected light.

The latest state of the art in light-sensitive materials used in photography is the use of the electronic medium. Video disks do not contain an emulsion or a base. When electronic mediums are used, light is converted to electrical impulses and these impulses are stored magnetically on a tape or disk. Since it is the camera itself that converts light to electrical impulses, the recording medium and all stages of the photographic process can be carried out in normal room light.

BLACK-AND-WHITE FILM

The characteristics and use of black-and-white film depend largely on the actual construction of the emulsion. These characteristics include the following: the degree of sensitivity to light, response to various

colors of light (color or spectral sensitivity), contrast, exposure latitude, emulsion latitude, and emulsion definition.

There are many types of black-and-white films available. Each type differs somewhat from the others. You should become acquainted with the characteristics of films. This knowledge is helpful in selecting the film most suitable for each photographic assignment.

EMULSION SENSITIVITY TO LIGHT

The silver halides and sensitizing dyes of most film emulsions are very sensitive to small amounts of light. This light causes invisible changes to the emulsion and is called the **latent image**. The latent image can be physically made visible by the chemical step of development. The extent of the reaction to the light of the emulsion is affected greatly by the size of the silver halide grains and the amount of light reaching the film. The inherent property of a film emulsion to respond to light is termed *film speed*.

Film Speed

Film speed is important, since it is related to the amount of exposure required to produce an acceptable image. Emulsions are rated as slow, medium, or fast, depending on the amount of light required to produce an image satisfactorily. Fast emulsions require less light to produce an acceptable image than slow emulsions.

To calculate the exposure for a film emulsion accurately and consistently with a light meter, the manufacturer has developed a system of rating emulsion speed. The rating system used is the ISO film speed system. ISO film speed is a numerical value assigned to an emulsion used for determining exposures.

The International Standards Organization (ISO) is a federation of all the national standard bodies of the world. It has approved a uniform set of film speed standards. The standards call for a universal expression of both arithmetic and logarithmic speed values with the ISO designation. The ISO designation generally looks like the following:

ISO 100/21°

Figure 2-1.—ISO of film.

302.258

The ISO assigned to a film is labeled on the packaging material and on the film cassette or paper backing (fig. 2-1). Some types of black-and-white films are assigned one ISO number; others are assigned two or more. Whether one or more film speeds are assigned depends on whether the film responds differently to different colors or color temperatures of light. Often, this results in a film having one speed for daylight and another for tungsten light. The ISO for a particular film is valid for calculating correct exposure only when that film is developed as recommended by the manufacturer.

An exposure index is another numerical value assigned to some films for exposure calculation. The exposure index is a more accurate method of film speed, because it is determined by processing a particular film through the actual process in an imaging facility. Exposure indexes are generally assigned to films used for copying or for technical applications.

SPECTRAL SENSITIVITY.—The response of an emulsion to specific colors of light or radiant energy is termed *color* or *spectral sensitivity*. You already know, from our earlier study of light in chapter 1, that the visible spectrum is made up of violet, blue, green, and

red light. When speaking of film or emulsion sensitivity, you are also referring to its sensitivity to ultraviolet and infrared radiation. Spectral sensitivity of an emulsion simply means that the emulsion is sensitive to some energy of the electromagnetic spectrum. Also, emulsions have color sensitivity, which means they are sensitive to one or more colors of the visible spectrum. In this chapter, the terms *color sensitivity* and *color response* are used interchangeably. Color sensitivity or color response refer to ultraviolet and infrared radiation as well as visible light.

All silver halides are sensitive to ultraviolet radiation, violet, and blue light. *Color-blind emulsion* is the term given to emulsions sensitive only to these radiations. The addition of sensitizing dyes to silver halides can increase the sensitivity of emulsions and extend their sensitivity to green and red light and infrared radiation. Increasing the color sensitivity of an emulsion to other than ultraviolet, violet, and blue is called dye, color, or optical sensitization.

The color sensitivity of a black-and-white film is an important characteristic, since it controls the way colored objects record as tones of gray in the negative

or print. The color sensitivity determines how the film is classed. There are four general classes of black-and-white film emulsions. The four classes are as follows: colorblind (monochromatic), orthochromatic, panchromatic, and infrared. Some of these emulsions respond to a wide range of wavelengths of light. Others respond to only a narrow band of wavelengths. Light-sensitive emulsions are sensitive to all wavelengths of ultraviolet radiation. For all practical purposes, the general classes of emulsions are considered insensitive to the shorter wavelengths of ultraviolet (UV) radiation. This is because glass lenses and the gelatin in most film emulsions completely absorb the shorter wavelengths of ultraviolet radiation. When UV is to be used for photography, a special film with a thin emulsion is required.

Color-blind Emulsions.—Black-and-white color-blind emulsions are sensitive only to UV radiation, violet, and blue light. Green and red objects record only as clear areas in the black-and-white negative and reproduce as dark areas in the print. Color-blind films are used primarily for copying and graphic arts photography and may be assigned three or more ISO values; for example, ISO/50 for daylight, ISO/8 for tungsten light, ISO/20 for white-flame arcs, and ISO/12 for pulsed xenon.

Orthochromatic Emulsions.—Orthochromatic emulsions are sensitive to ultraviolet radiation, violet, blue, and green light. The sensitivity to green light is gained by the addition of a sensitizing dye to the color-blind silver halides. The emulsions provide an approximate correct reproduction of blue and green objects as corresponding tones of gray in a print; however, red objects record as clear areas in the negative and black areas in the print. Since the emulsion is not sensitive to red. Various orthochromatic films with different degrees of contrast, color sensitivity, and emulsion speed are available. Their trade names usually contain the word *ortho*. Orthochromatic emulsions are used primarily for copying and graphic arts photography.

Orthochromatic emulsions that may be used in either daylight or tungsten light are assigned two separate ISO film speeds. This is because these emulsions are highly sensitive to the predominantly blue colored daylight and less sensitive to the tungsten light that has a higher content of red light.

Panchromatic Emulsions.—Panchromatic emulsions are sensitive to UV radiation, violet, blue, green, and red. The emulsion spectral sensitivity to green and red light is gained by adding sensitizing dyes to the

color-blind silver halides. Panchromatic film of varying degrees of contrast, color sensitivity, and emulsion speed is available. Panchromatic emulsions are used for copying, portraiture, and general black-and-white photography.

Panchromatic emulsions are assigned only one ISO film speed. This is because panchromatic emulsions are sensitive to red light and have an almost equal response to predominately blue-colored daylight and predominately red-colored tungsten light.

Infrared Emulsions.—Infrared (IR) emulsions are sensitive to UV radiation, violet, and blue light, with little or no sensitivity to yellow-green light but with additional sensitivity to red and IR radiation. The sensitivity to infrared radiation is gained by adding a sensitizing dye to the color-blind silver halides. Infrared emulsions are commonly used for aerial and medical photography as well as forensic photography (photography used for evidence). For best results a black-and-white UV film should be exposed only with IR radiation. To prevent any IR radiation or visible light from affecting the infrared emulsion during exposure, you must use a dark, red filter over the camera lens.

Since infrared radiation does not focus at the same point as visible light, a lens focus adjustment is necessary for critical focusing. Most lenses have a calibrated infrared focusing position on the focusing scale. This position is usually marked by a small, red dot or the letter *R* in red.

Determining a useful exposure index becomes a problem with infrared film, because exposure meters are calibrated for visible light and similar light sources can emit different amounts of infrared radiation. When using infrared film, you should make trial exposures for each particular film and photographic situation.

Contrast

In the development process, the silver halide grains in a black-and-white film exposed to light remain in the film. These grains form the image of the original scene. The colors of the scene are recorded in the negative as densities of gray instead of appearing as their original colors. These densities of gray can range from very dense to very thin. This depends upon the brightness of the objects in the scene, their color, and the color sensitivity of the film. The ratio of the maximum to the minimum brightness of objects in a scene is referred to as the scene brightness range. Most long scale black-and-white films are capable of recording scene brightness ranges up to 128:1. In a negative, a

light-colored object records as a heavy-density (dark) area, and a dark-colored object records as a low-density (thin) area; therefore, a negative image is reversed compared to the original scene. This reversal is produced by a bright object in the scene reflecting more light than a darker object. The greater amount of reflected light from the brighter object affects more silver halides in the emulsion.

The portions of the negative where the most silver halides have been affected are referred to as **HIGHLIGHTS**. The portions that are least affected are referred to as **SHADOW AREAS**. The light reflections from objects other than the brightest and darkest are referred to as **MIDTONES**.

The amount of metallic silver deposit in any portion of a negative is referred to as **density**. The amount of light that a negative transmits in a given period of time is controlled by the density of the metallic silver deposits. Therefore, density is used to describe the light-stopping ability of a negative.

The difference in densities between areas in a negative is known as **contrast**. The total contrast (density range) of a negative is defined as the difference in density between the least-dense shadow area and the most-dense highlight area in a negative.

Emulsion Latitude

The inherent ability of a black-and-white film to record a range of scene brightness differences as differences in density is termed *emulsion latitude*. Normal- and low-contrast emulsions can record a wide range of scene brightness values and are considered to have a wide emulsion latitude or long scale. High-contrast emulsions record a short range of scene brightness values and are considered to have a narrow emulsion latitude or short scale.

Exposure Latitude

The amount the exposure can be varied (increased or decreased) from the ideal exposure and still provide an acceptable negative is termed *exposure latitude*.

The least amount of exposure that records sufficient shadow detail generally provides the best quality negative and is considered the ideal exposure. The use of a determined exposure index leads to the ideal exposure for a particular film and process combination. Generally, the use of the assigned ISO speed provides acceptable results.

Emulsion Definition

Several factors, including graininess, resolving power (resolution), and acutance, affect the definition or capability of an emulsion to produce a clear, sharp image.

GRAININESS.—The negative image consists of nearly an infinite number of density deposits of metallic silver. To the naked eye, these grains of silver appear as a smooth, continuous deposit; however, when the image is magnified significantly, a speckled, granular, or mottled effect becomes apparent. This appearance of the enlarged image is called **graininess**.

The graininess of a negative depends upon the size of the silver halides in the emulsion, the exposure the emulsion received, and the clumping action of the metallic silver grains during development. Although each emulsion has an inherent grain size, the graininess effect in a negative can be minimized by giving the film correct exposure and proper development. As a general rule, slower speed emulsions have a finer grain (a smaller grain size) than faster speed emulsions.

The Eastman Kodak Company uses modern tabular, or T-grain, technology in some of their emulsions. In doing so, flat, tabular crystals are used which are very efficient in absorbing light. In T-grain emulsions, fewer silver halide crystals are needed, because the crystals have a relatively large surface area for light to strike, but are thin and contain a small amount of silver halides. These properties provide higher resolution and lower graininess compared to other films with the same relative film speed.

Not all black-and-white films form the final image in black metallic silver; for example, Ilford's XP-1 black-and-white film produces a dye image. The advantage of this technology is the film can be processed in color-processing chemicals along with color film and then printed on black-and-white paper.

RESOLVING POWER.—This is a term used to define the ability of an emulsion to record fine detail. The resolving power, or resolution, of an emulsion is expressed as line pairs per millimeter. Resolving power is determined by photographing a lined test chart at a greatly reduced size then counting the lines present in one millimeter of film.

ACUTANCE.—This is the ability of an emulsion to produce sharp edges between image density differences. Do not confuse this with the ability of an emulsion to produce sharp images controlled by lens focus. Although an image is in focus, the line between a

Figure 2-2.-Cross section of black-and-white film.

highlight area and a shadow area is not perfectly sharp. This is because the high-density area tends to “bleed” onto the low-density area due to the scattering or diffusing of light in the emulsion during exposure.

CONSTRUCTION OF BLACK-AND-WHITE FILM

Light-sensitive materials are composed of two basic parts: the emulsion and the base. The emulsion is the light-sensitive portion that records the image. The base is the support to which the emulsion is coated. Also, negative materials have additional layers that perform a special purpose. They are as follows: overcoating, antihalation backing, and noncurl coating (fig. 2-2). The purpose of the five parts of photographic film are as follows:

1. Overcoating—The overcoating protects the film from friction, scratches, or abrasions before development. The overcoating is a clear, gelatin layer that is sometimes called the antiabrasion layer.
2. Emulsion—thin layer of gelatin that suspends and supports the light-sensitive silver halides.
3. Base—This supports or holds the emulsion in place. The base may be transparent, translucent, or opaque, depending upon how the recorded image is to be used. The base is generally made of a cellulose acetate.
4. Antihalation backing—The antihalation backing prevents light from reflecting from the base back into the emulsion. The antihalation dye is sometimes incorporated in the anticurl backing. The dye used to eliminate halation is a color to which the emulsion is least sensitive. This dye is water soluble and is completely dissolved during processing.
5. Noncurl coating—The noncurl coating is a hardened gelatin, about the same thickness as the

PROTECTIVE OVERCOATING

Figure 2-4.-Modern high-speed color film.

emulsion, and is applied to the back of the film. A film emulsion swells when wet and shrinks when dry. This contraction produces a strain on a film base because it is highly flexible. The noncurl coating prevents the film from curling during the drying process.

COLOR FILM

Modern color films are constructed much the same as black-and-white film, but color films consist of three separate emulsions on a single film base. Each of the three emulsion layers records one of the three additive primary colors—red, green, or blue. The top emulsion layer is sensitive to blue light and produces yellow dyes. Between the top emulsion layer and the middle emulsion layer is a yellow filter (fig. 2-3). The yellow filter absorbs the blue light that would otherwise affect the middle and bottom emulsion layers. During processing, this yellow filter is dissolved. The middle emulsion layer records green light and produces magenta dyes. The bottom emulsion records red light and produces cyan dyes. Many of the modern high-speed color films have fast and slow emulsion layers for each primary color (fig. 2-4).

In some color films where tabular-grain (T-grain) emulsions are used, high speed and increased sharpness are combined. When these films are manufactured, the overall thickness of the film is reduced. By reducing the overall thickness, you also reduce the scattering of light within the film, resulting in improved sharpness. Also, double-emulsion layers, one fast and one slow, may be incorporated to improve film speed in color films.

Each emulsion layer of color film either has an incorporated dye coupler or a dye that is put into the emulsion during processing. A dye coupler is a chemical that produces a dye by combining with the oxidized products that occur during color developer.

Color Negative Film

A color negative film records a scene in image densities opposite to the brightness of objects in the scene—the same as a black-and-white negative film. Color films can be recognized because they contain the suffix “color,” such as Vericolor, Kodacolor, and Fugicolor. These color films are used when a print is the final product. Most color negatives (other than color film used for aerial photography) have an orange mask. This orange mask increases the color separation that reproduces colors more accurately in the final print.

During development, colors are formed in the emulsion that are complementary to the color of the original scene; for example, a red object in the scene is recorded as cyan in the negative. It is a combination of yellow, magenta, and cyan that records all the other colors that you see in the scene. Color dyes in the emulsion layers control the colors of light passing through the color negative.

Color negative film images can be printed on color positive materials, such as color paper and color print film, to produce color prints or color transparencies. Color negatives can also be printed on a special panchromatic black-and-white paper to produce black-and-white prints.

Color Reversal Film

Color reversal films produce positive images in densities directly proportional to the reflective brightnesses of objects and in the same colors as those in the original scene. Reversal films are recognized by the suffix “chrome” in their names, such as Ektachrome, Kodachrome, and Fujichrome.

The positive image of most color reversal film is produced by a two-stage development process. This

process causes chemical fogging and color developing of the portions of the silver halide emulsions that were not affected by camera exposure or the first black-and-white developer. Like color negative film, color reversal film has three emulsion layers that are sensitive to blue, green, and red light and produces yellow, magenta, and cyan dyes, respectively. The film contains dye-forming chemicals that are put into the emulsion layers during manufacturing. A color developer produces three dye images in the emulsion layers. The three dye images in a developed color reversal film control the colors of light passing through the film.

Kodachrome film does not contain dye-forming chemicals in the emulsion layers. They are introduced during processing from three separate color developer solutions. Kodachrome film has high resolving power and fine grain and produces a fine image. Processing Kodachrome film is a complex operation and can only be performed by a Kodak processing plant.

Developed color reversal film can be used as a transparency (slide) for direct viewing, printed directly onto a color reversal paper, copied on a black-and-white film for producing black-and-white prints, or copied to a color internegative (copy negative) for producing color prints.

Color Balance

Color balance is the acceptable relationship among the three color images in a positive color print or slide. This means that when the color print or slide looks correct, color balance has been achieved.

To help achieve this acceptable relationship, the manufacturer balances color film emulsions for exposure with a specific Kelvin temperature (K). Remember, daylight usually has a higher content of blue light than red light, while tungsten illumination usually has a higher content of red light than blue light. To compensate for the lower proportion of red light in daylight, the manufacturer balances color films for daylight, so they have a higher sensitivity to red light than to blue light. To compensate for the lower proportion of blue light in tungsten illumination, the manufacturer balances color films for tungsten illumination, so they have a higher sensitivity to blue light than to red light.

Generally, color films are referred to as daylight (outdoor) or tungsten (indoor), indicating their broad use without filters. Specifically, daylight films are balanced for use in sunlight or with an electronic flash

that averages approximately 5400 K. Tungsten films are balanced for use with illumination of 3200 K without filtration.

The Kelvin temperature of the exposing light for reversal films is much more critical than the color of the exposing light for color negative films. When an exposing light is used other than that for which color negative film is balanced, adjustments to the filter pack can be made during printing to achieve proper color balance. With color reversal film, however, a slide is usually the final product. When the color of the exposing light is other than that for which the film is balanced, the transparencies are off-color. You should strive to expose all color films with the color light for which the films are balanced.

Although color films have three separate emulsions, only one ISO film speed is assigned. An ISO film speed for color film is most accurate when the illumination used is the one for which the film is balanced.

Amateur and Professional Color Films

Much of the color film used in the Navy is manufactured by Eastman Kodak Company. Kodak markets color films for both professional and amateur photographers. Color films intended for use primarily by professionals are identified by the word *professional* in the name; for example, Kodak Vericolor III Professional Film, Type S (VPS).

Both professional and amateur films have similar color quality, sharpness, and granularity characteristics. Also, they have emulsions made up of many different chemicals that tend to change slowly with time. Starting from the day they are made, all color films begin to change; and as the films age, their color balance changes.

Amateur films are manufactured to age and reach a peak color balance much later than professional films. The manufacturer allows for the time amateur film will be in storage, on the store shelf, and in the camera before it is developed. The ISO speed assigned is adequate for calculating exposure for normal picture-taking situations.

Professional films are manufactured so they are very near their optimum color balance at the time they are shipped from the factory. These films should be kept refrigerated or frozen until shortly before use. Refrigeration keeps film near the optimum point until used and provides the photographer with confidence in consistent results. Precise film speeds are provided for

professional films. The film is intended for prompt processing to prevent any significant shift in color balance after exposure.

If you require optimum color balance and precise film speed within about 1/6 f/stop professional film is appropriate for your work; however, when you intend to be away from home base for an extended period of time without refrigerated storage or processing facilities, amateur film should be your choice.

Instant Picture Film

Currently, the only manufacturer of instant picture film is Polaroid. There are two basic types of instant picture film: peel apart and integral. After exposure and removal from the camera, peel-apart film must be timed while the film develops. After it has developed for the specified period of time, the negative backing is peeled away and discarded. Integral films develop outside the camera and have no negative backing to be removed.

Instant picture color films are tripack materials with built-in processing. Peel-apart film uses a system whereby the exposed silver halides develop to a metallic silver negative. When no metallic silver is present, dyes pass to form the color image. Integral films use a reversal process in which the areas of unexposed silver halides are the locations where the dyes are produced to form the positive image.

Instant picture film is a very useful medium in an imaging facility, particularly when still electronic technology is not available. Instant picture film is used commonly for identification and passport photographs, but it is also valuable in determining test exposures. Before you make your final exposures on conventional film, a Polaroid photograph can be taken to confirm composition, lighting, and exposure.

FILM SIZES

There are two types of film formats used commonly in photography. They are roll film and sheet film. Both formats come in a variety of sizes.

Roll Film

All roll film is packaged so the film can be loaded and unloaded from a camera in daylight. Number 120 film has a paper backing that prevents the film from being exposed in daylight; 35mm film is wound in a lighttight cassette that prevents the film from being exposed by ambient light.

Figure 2-5.—Notch codes used to identify the type of film.

Figure 2-6.—Location of notch code that indicates the emulsion is toward you.

The most popular medium-size format film is No. 120. This film, depending on the camera format, provides negatives that are 6x6 cm (2 1/4 x 2 1/4 inches), 4.5x6 cm, or 6x7 cm. No. 220 roll film is used for making the same size negatives, but because most of the paper backing is eliminated, the roll is longer than a 120 roll and provides twice as many frames as 120 film.

Still picture 35mm films come prepackaged in cassettes in lengths for producing 12, 20, 24, and 36 frames per roll. Also, 35mm films come in rolls 100 feet long that can be bulk-loaded into reusable cassettes.

Sheet Film

Sheet or cut film is made in a variety of sizes from 4x5 to 11x14 inches and larger. The most common sizes are 4x5 and 8x10 inches. Most sheet film has no paper backing and must be loaded into and removed from film

holders in the darkroom in total darkness or under the appropriate safelight. Eastman Kodak does market the Kodak Readyload Packets that provide two sheets of film in a paper packet. These packets can be loaded into a Kodak Readyload Packet film holder or a Polaroid film holder, Model 545. The Kodak Readyload Packets are available only in 4x5 format.

Most sheet films have reference notches in one edge of the film. In the dark, this allows identification of the film type and the emulsion side of the film. Every film type has a different notch code (fig. 2-5). The emulsion side of the film is toward you when the notches are along the top edge in the upper right-hand corner, or on the bottom right edge in the lower right-hand corner of the film (fig. 2-6).

For those sheet films that do not have notches, the emulsion side of the film can be identified under a safelight. The emulsion side is lighter in color than the base side. If the emulsion side of the film must be identified in total darkness, wet your lips and place the edge of the film between them. The emulsion side of the film will stick to one of your moistened lips.

FLOPPY DISKS

Although the floppy disks used in electronic imagery are not light sensitive, they are, however, a commonly used image-recording medium. All floppy disks are the same. There are no black-and-white and color floppy disks. The camera and the printer being used determine whether the image is black and white or color. Images are stored as magnetic impulses on compact 2-inch still-video floppy disks.

The pictures are recorded on tracks on a still-video floppy disk. Each picture is recorded either as a FRAME or FIELD (the frame or field mode is selected on the camera). When the frame mode is selected, each picture is recorded on two tracks. Twenty-five images can be recorded on a floppy disk in the frame mode. When the field mode is selected, each picture is recorded on one track. In the field mode, 50 images can be stored on each disk. The result of using one track per photograph is the images are less detailed than those recorded on two tracks (frame mode). The quality of the frame-recorded image is superior to that of the field-recorded photograph. A combination of field and frame images can be stored on the same disk; however, for higher quality use the frame mode.

Sound can also be recorded on a floppy disk. Sound is not recorded on the same track as the image. It is recorded right after the image is recorded. The sound

associated with the picture can be heard during playback

Floppy disks used in electronic imaging can be reused for endless times-the same as any other magnetic recording medium. No chemicals or darkroom techniques are required to produce these images. Once the image is captured on the floppy disk, it can be transmitted over the telephone lines, edited, and printed using a video printer-all under normal room-lighting conditions.

BLACK-AND-WHITE PRINTING PAPER

The performance and use of black-and-white photographic printing paper, like black-and-white films, depends on the characteristics of the paper material. While the many types of photographic papers differ in their characteristics, they all basically consist of the emulsion on a paper support or base. Photographic printing papers (both black and white and color) are manufactured in both various cut sheet sizes, ranging from 5x7 to 20x24 inches and rolls up to 1,000 feet long.

Photographic papers used in Navy imaging facilities are either coated with polyethylene or are resin-coated. These papers are coated on both sides of the base. This clear coating is treated so the paper does not stick to the surface of other prints during processing. Polyethylene-coated papers (manufactured by Ilford) can be marked on with pencils and pens. Coated papers have water-resistant bases that provide short processing times. Most black-and-white papers with these coatings have developing agents incorporated in the emulsion. The developing agents are activated when the paper is exposed to an alkali solution. The characteristics of resin-coated paper make it ideal for machine processing, but they may also be tray-developed in a regular print developer.

The image on black-and-white film is usually negative or recorded in tones of gray in reverse of the reflective brightness values of a scene. When the negative image is projected onto black-and-white paper, the resulting image is positive or recorded in tones of gray relative to the reflective brightness values of the original scene. A negative is usually used or viewed by transmitted light. A paper print (or simply a print) is usually viewed by reflected light and may be referred to as a reflection print or reflection positive.

Emulsion Sensitivity

The emulsions used for printing paper are much slower (less sensitive to light) than most film emulsions.

Figure 2-7.—Cross section of variable-contrast black-and-white paper.

A high sensitivity to light is not needed. Prints are often manipulated by providing additional exposure or by holding back exposure to selected areas of the print. If the paper emulsions were fast, exposure times would be extremely short and print manipulation would not be possible.

The color or spectral sensitivity of a paper emulsion indicates the response to specific colors of light or radiation-the same as that for a film emulsion. The terms *colorblind*, *orthochromatic*, and *panchromatic* are also used to describe the spectral sensitivities of paper emulsions. The response of a paper emulsion to wavelengths other than ultraviolet radiation, violet, and blue light is achieved by the addition of sensitizing dyes to the emulsion during manufacturing.

The ranges of sensitivity for all paper emulsions begin in the near-ultraviolet region of the invisible portion of the electromagnetic spectrum. The color sensitivity of undyed silver emulsions extend to blue and blue-green. Panchromatic printing papers are sensitive to ultraviolet radiation, violet, blue, green, and red light. The color sensitivity of a black-and-white paper is NOT a determining factor for selecting a paper to print a specific black-and-white negative. Panchromatic papers, however, are normally used to produce black-and-white prints from color negatives. Color sensitivity DOES determine whether or not a safelight is required and, if so, what color of safelight can be used.

Variable Contrast Papers

Variable contrast papers are used almost exclusively in Navy imaging facilities. The contrast of the print image on variable contrast papers is controlled by the specific color of the exposing light. Variable contrast papers have two emulsion layers. The top layer is a high-contrast emulsion and is sensitive to blue light. The second emulsion layer is a low-contrast emulsion and is sensitive to green light (fig. 2-7). When a normal contrast negative is exposed through a variable contrast filter with blue light, a harsh, contrasty print is produced.

RED SENSITIVE EMULSION LAYER - PRODUCES CYAN DYES
GREEN SENSITIVE EMULSION LAYER - PRODUCES MAGENTA DYES
BLUE SENSITIVE EMULSION LAYER - PRODUCES YELLOW DYES

Figure 2-8.—Cross section of color printing paper.

When the same negative is exposed on another sheet of paper with green light, a flat or not enough contrast print is produced. When the normal-contrast negative is printed with the proper combination of blue and green light, a print with natural contrast is produced; therefore, to control contrast when using variable contrast papers, you can use a series of yellow and magenta filters to control the amount of blue and green printing light during exposure.

COLOR PRINTING PAPERS

Color printing papers are for printing color negatives or color transparencies. Like color negative films, color printing paper can be identified by the suffixes “color” and “chrome.” These papers are designed for printing color negatives and color transparencies, respectively.

Like color films, color papers have three emulsion layers. The order of the emulsions is reversed in comparison to color films (fig. 2-8). The top emulsion layer is sensitive to red light and produces cyan dyes, the middle emulsion layer is sensitive to green light and produces magenta dyes, and the bottom emulsion layer is sensitive to blue light and produces yellow dyes.

PAPER SURFACES

Photographic papers are available in a variety of paper surfaces, such as matt, semimatt, lustre, high lustre, pearl, and glossy. The use of different paper surfaces depends on the final application of the photograph. There are two paper surfaces that are used frequently in Navy imaging facilities: glossy and matt. Paper that has a smooth, glossy surface provides a print with higher contrast and higher densities or color saturations, resulting in an apparently sharper image. This is due to the direct reflection quality of the paper surface (fig. 2-9, view A). Glossy papers are always used for photographic prints that are used to show fine detail, such as equipment damage or intelligence photographs.

Light reflected from MATT paper is diffused and provides a softer, lower contrast image (fig. 2-9, view B). Because of the lower contrast, subject detail does not appear as sharp as an image on glossy paper. Matt papers are used commonly for portraiture and scenic photographs.

PROPER HANDLING AND STORAGE OF FILMS AND PAPERS

Care in handling films and papers prevents fingerprints, abrasions, and scratches on the surfaces of these materials. You should particularly avoid unnecessary contact between an emulsion surface and any other object. Only handle light-sensitive materials by the edges.

Light-sensitive materials should be removed from their packages in a room that is clean, dust-free, and lightproof. The workbench and your hands should be clean and dry. Light-sensitive materials should be

Figure 2-9.—Reflection of light of different surface paper.

handled in total darkness or under safelight conditions specified by the manufacturer.

Unexposed light-sensitive materials deteriorate slowly with time even when the materials are stored under ideal conditions. High temperatures and high relative humidity accelerate this deterioration. You should protect light-sensitive materials from the harmful effects of temperature, humidity, x rays, gases, and vapors that may be present in darkrooms, transport, and adverse storage conditions. Storage instructions are printed on the packaging materials of most photographic products.

Kodak papers and sheet film are packaged in humidity-sealed boxes to protect them from changes in relative humidity (RH). Keep these materials in their original packaging until you are ready to use them. When the RH gets at 60 percent or higher for long periods of time, not only do cardboard packages, labels, and metal containers become damaged, but mold, fungus, and bacteria start to grow. Fungi can destroy film and paper by digesting the gelatin in them. Ideally, film and paper should be stored below 50 percent RH.

The usable life of a light-sensitive material varies with the type of material, but generally, color materials deteriorate more rapidly than black-and-white materials, and black-and-white materials with high-speed emulsions deteriorate more rapidly than black-and-white materials with slow-speed emulsions.

Cold storage in a refrigerator or freezer is recommended for all light-sensitive materials; however, refrigerators and freezers that contain food or unsealed containers of liquids have a high relative humidity. Therefore, food should never be stored in the same refrigerator as film and paper.

Paper and professional film should be stored at about 50°F (10°C) or lower in the original sealed package. All film, including amateur film, must be protected from extreme heat. Never store photographic materials in extreme heat, such as in a glove compartment, trunk, or the back window of a car. Once opened, the original package should be used as soon as possible. After opening, the materials are no longer protected from humidity or chemical fumes.

When film or paper, black and white or color, is removed from cold storage into a warmer atmosphere, allow a warm-up time before opening the original packaging; otherwise, moisture condensation may form on the film or paper. The warm-up time for light-sensitive material depends on the type of material packaging, the size of the package, and the amount of material.

The warm-up times for packages of paper is considerably longer than for film. Paper is usually packaged in larger quantities, 100 to 500 sheets per box and in rolls up to 1,000 feet long. Short roll film and magazines take 1 to 1 1/2 hours to warm-up. Large packages and rolls of film and paper should be allowed to warm-up to room temperature overnight or about 10 hours.

FILM AND PAPER EXPIRATION DATES

Each package of film is marked with an expiration date. Ideally, the film should be processed before this date for best results. If the film has not been used by this date, it should be tested photographically to confirm and determine its adjusted film speed and performance. Much of the film and paper found in Navy inventory has, in fact, expired. When not subjected to adverse storage and handling conditions, the film is probably still usable for a reasonable time. You should consider the expiration date as a guide only.

Use light-sensitive materials of the same type in the order of their expiration dates. The material with the earliest expiration date should be used first. One exception to this is when you know that a material of the same type with a later expiration date has been subjected to improper storage conditions; for example, if film or paper has been sitting on a pallet on the flight ramp in Diego Garcia for several weeks before being delivered to the ship, you should test the material before using it. Film and paper stored under unfavorable conditions or film that has expired may have a loss of emulsion speed, undesirable contrast changes, stains, color shifts, or high gross fog.

CHAPTER 3

PHOTOGRAPHIC FILTERS

Filters are used in all the various steps of the photographic process. Though often neglected in the shooting stage, the use of filters can tremendously enhance the final product in both black-and-white and color photography.

PURPOSE OF PHOTOGRAPHIC FILTERS

The purpose of photographic filters is to alter the characteristics of light that reaches the light-sensitive emulsion. As light is transmitted through a filter, at least one of the following alterations occurs:

1. The color of light is modified.
2. The amount of light is reduced.
3. The vibration direction of the light rays is limited.

The two most important reasons for using photographic filters are to create an effect with an emulsion and to control the exposure of an emulsion. Interlocked with the use of filters are characteristics of light and characteristics of photographic emulsions. The effectiveness of a filter depends upon the ability of an emulsion to respond to the color of light transmitted by the filter.

Colored filters modify the way colors are recorded. Without the use of filters, black-and-white panchromatic film records colors as gray tones. These gray tones correspond roughly to the tonal range as seen by the human eye. Colored filters selectively brighten or darken these tones. In color photography, colored filters are used to correct or distort color balance.

Filters of a specific color transmit most of the light of that color and partially or completely absorb light of all other colors. For example, a red filter transmits red light and may partially or completely absorb blue and green light, depending on the deepness or purity of its color (fig. 3-1). Likewise, a yellow filter transmits red and green light and partially or completely absorbs blue light. Remember, a secondary color of light is produced by combining two primary colors of light. Red and green equal yellow; thus a yellow filter passes red and green light.

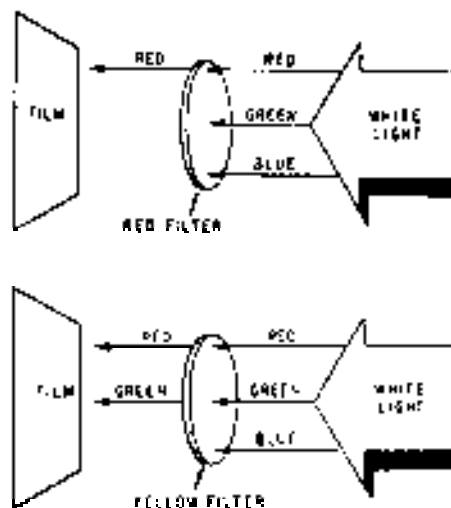

Figure 3-1.—Red and yellow filters.

Filters are available in three forms: optical glass disks bound with metal rims, lacquered gelatin film squares, and glass squares. Glass disk filters are the most practical for general use. They are available in different sizes called series numbers, such as Series 4, 5, and 6 or in millimeter sizes, such as 52mm and 59mm. Glass disk filters attach to a camera lens in two ways. Some have threads and screw directly into the lens barrel, and the others are held on the lens barrel by an adapter ring. Gelatin filters and square filters made of glass are either inserted into special filter holders that are part of the camera, or they are held on the camera by a square filter holder.

FILTER DESIGNATIONS

Filters are usually identified by numbers. This system of designating filters is used to identify Kodak Wratten filters. It uses designators, such as No. 6, No. 8, and No. 11. Some filters have a descriptive name rather than a number; for example, polarizing, skylight, and neutral density. Color compensating and color print filters have yet another designation system.

FILTERS FOR BLACK-AND-WHITE PHOTOGRAPHY

Filters used with black-and-white film are classified as contrast, correction, and special purpose. All contrast and correction filters have a noticeable color. It is important to note that a filter must be used with an emulsion sensitive to the specific color of light it transmits. Colored filters should normally be used with black-and-white film only.

Special-purpose filters for black-and-white film may be colorless, contain a hint of color, be noticeably colored, or almost visually opaque. Some special-purpose filters can be used with both black-and-white and color film. Special-purpose filters are covered later in this chapter.

Contrast Filters

Contrast filters are available in all colors and are designed to exaggerate, reduce, or eliminate specific colors of light. As their name indicates, these filters are used to increase or decrease contrast in a negative that provides differences between tones in the print.

To illustrate this, compare a red apple and a yellow banana in a black-and-white print. With a red filter over the camera lens, the apple appears lighter on the print than the yellow banana. Both objects in this example reflect the same intensity of light.

When you look through a red filter, the filter definitely appears red. This color is the effect it produces in your eye and the reason it is called a red filter. The red filter is transmitting most of the red part of the spectrum, some yellow, and some magenta. The color it is not transmitting is cyan. If you think of this red filter as an anticyan (blue and green) filter, you will better understand the way it works.

When a red filter is used, most of the reflected red light from the red apple is transmitted through the filter and recorded as a dense area on the film. Only a portion of the yellow light is transmitted, so it is recorded as a less dense area on the film. Only some of the yellow light is transmitted because the reflected light from the banana consists of red and green light. Although the red portion of the yellow light is readily transmitted through the red filter, the green portion is absorbed to some degree. Thus less light from the yellow banana reaches the film emulsion.

When the negative is printed, the two print images have separation in contrast because of the differences in negative densities. The print image of the apple is lighter

than the print image of the banana because the negative image of the red apple is more dense than the negative image of the yellow banana.

When using a specific color of contrast filter to provide separation between black-and-white images of colored objects, you should also take into account what effect the filter has on the images of other colored objects in the scene. For example, when there are blue and green objects in the scene, the red filter absorbs some or all of the reflected blue and green light. The red filter renders the negative images of these objects as low-density areas. Thus the print images have darker tones or densities.

Contrast filters can also be used to filter out an image or filter out the image of a transparent stain on an original document by copying it. This filtering-out process takes place by blending or matching the density of the image to be filtered out with the image density of the surrounding area. For example, to eliminate the image of a yellow line on a white background, use a yellow filter. The yellow filter should be as deep (same color density) or deeper in color than the color of the line. The yellow filter reduces the intensity of the light reflected from the white background by absorbing blue light. The intensity of the light reflected from the yellow line is not greatly affected since the yellow filter readily transmits the yellow light. The reduction of the intensity of the light reflected from the white background and the intensity of the light reflected from the yellow line produces equal densities on the negative and thereby does not render an image of the yellow line. Conversely, when the yellow line is on a black background, a blue filter does not allow yellow light to be transmitted. Therefore, light from the yellow object is not allowed to affect the film emulsion. Thus the line appears as a thin area that matches the black background and is thereby "eliminated"

Stains on a drawing or a picture can be filtered out whenever the stain is transparent and reasonably pure in color. The filter should be approximately the same color as the stain. The stain may still show in the negative but, in the case of line material, proper paper contrast and printing exposure get rid of the rest of the stain image.

Remember, the color of filter required to eliminate the image of an object or stain is determined by the color of the object or stain and the darkness or lightness of the surrounding scene area. Also, always use a filter that is as deep or deeper in color than the color of the object or stain to be eliminated. Refer to table 3-1 for clarification on ways to use contrast filters.

Table 3-1.—Parallel Filter Bars

Filter Color and No.		Filter Color and No.	
Deep Red	29	Bluish Green	65
Red	25	Bluish Green	65
Light Red	23A	Cyan	4
Orange	21	Cyan	44
Deep Yellow	15	Blue	47
Yellow	8	Deep Blue	47B
Yellowish Green	11	Violet	34A
Yellowish Green	13	Violet	34A
Green	58	Magenta	33
Green	61	Magenta	33

Use the parallel filter bars to choose contrast filters for black-and-white photography. Adjacent filters lighten colors next to them. Opposite filters darken colors in the print; for example, a yellowish green No. 11 filter lightens subjects that are yellowish green or yellow and darkens subjects that are violet. A No. 44 cyan filter lightens blue and blue-green and darkens light red and orange.

Correction Filters

Although panchromatic film responds to all the colors the eye can see, it does not reproduce tones of red, green, and blue objects in the same relative values as the eye sees them. The human eye is much more sensitive to green than it is to blue and red, and these colors look darker to the eye than green (fig. 3-2). Panchromatic film is more sensitive to blue and violet and looks lighter than green in a black-and-white print. This high sensitivity to blue and violet causes an overexposure to the film of blue objects as compared to green objects. This overexposure causes a dense negative image that results in a light print image (fig. 3-3).

A No. 8 yellow filter with panchromatic film helps to reproduce colors of a daylight scene with the same brightness relationship as seen by the human eye.

When using tungsten lighting, you can use a yellowish green No. 11 filter to reproduce the natural brightness relationship with panchromatic film. The yellow in the filter absorbs the ultraviolet radiation and some of the blue light, while the green in the filter absorbs some of the red light.

Figure 3-2.—Color sensitivity of the average human eye.

Figure 3-3.—Color sensitivity of panchromatic film.

Table 3-2.—Recommended Filters for Use with Black-and-White Panchromatic Film in Daylight

Subject	Desired Effect	Filter to Use	
Blue Sky	Natural	Yellow	No. 8
	Darken	Deep yellow	No. 15
	Very dark	Red	No. 25
	Near black	Deep red	No. 29
Seascape when sky is blue	Natural	Yellow	No. 8
	Dark water	Deep yellow	No. 15
Sunset	Natural	None/yellow	No. 8
	Brilliance	Deep yellow	No. 15
		Red	No. 25
Landscapers	Added haze for distant effect	Blue	No. 47
	Natural	Yellow	No. 8
	Reduce haze (little)	Deep yellow	No. 15
	Reduce haze (a lot)	Red	No. 25
Green colors		Deep red	No. 29
Green colors	Natural	Yellow	No. 8
	Light	Green	No. 58
Reddish colors	Lighter	Red	No. 25
Bluish colors	Lighter	Blue	No. 45
Wood, stone, sand, snow, fabrics, etc.	Natural	Yellow	No. 8
	Render texture	Deep yellow	No. 15
		Red	No. 25

To obtain desired effects with the use of filters, refer to table 3-2.

FILTERS FOR COLOR PHOTOGRAPHY

Problems associated with color materials are quite different from those encountered with black-and-white materials. In color photography, the main problem is achieving correct color balance. The principal factor involved is the color temperature of the light source being used to illuminate the subject. This color temperature provides a natural appearance to the final product. Filters for color photography are classified as light balancing, conversion, and color compensating.

LIGHT BALANCING FILTERS

Light balancing filters come in two series (not to be confused with a series that indicate physical size): the Series 81, yellowish filters, are used to lower the color temperature of a light source; and the Series 82, bluish filters, are used to raise the color temperature of light from a light source. Both series are used when a tungsten light source is used with color film.

These two series of filters permit minor adjustments in the color quality of an exposing light to obtain cooler (bluer) or warmer (more yellow) reproduction of colors; for example, when the color temperature of a tungsten light source is 3100 K and a color temperature of 3200 K is desired for the exposing light, a Series 82

Table 3-3.–Light Balancing filters

Filter color	Filter number	To Obtain 3200 K from:	To Obtain 3400 K from:
Yellowish	81	3300 K	3510 K
	81A	3400 K	3630 K
	81B	3500 K	3740 K
	81C	3600 K	3850 K
	81D	3700 K	3970 K
	81EF	3850 K	4140 K
Bluish	82C+82C	2490 K	2610 K
	82C+82B	2570 K	2700 K
	82C+82A	2650 K	2780 K
	82C+82	2720 K	2870 K
	82C	2800 K	2950 K
	82B	2890 K	3060 K
	82A	3000 K	3180 K
	82	3100 K	3290 K

color balancing filter can be used to raise the color temperature 100 K. Light balancing filters affect the entire visible spectrum of tungsten light and provide an adjustment from one Kelvin temperature to another.

When the color temperature of a tungsten light source is unknown, you can use a color temperature meter to determine it. When trying to determine what light balancing filter to use for producing a particular color temperature with a given light source, you may use the following methods:

1. Refer to the scale on a color temperature meter.
2. Refer to the tables in the *Photo-Lab-Index*.
3. Consult the manufacturer's publication for a particular filter or meter.
4. Consult appropriate film or filter data sheets.

Light balancing filters are Series 81 and Series 82. Refer to table 3-3 to determine light balancing filters that can be used to raise or lower the color temperature of a given color.

CONVERSION FILTERS

Conversion filters are used in color photography when a significant adjustment of an exposing light is required to convert the color quality of the exposing light to the color temperature for which a film is balanced.

Conversion filters generally come in two series. The 80 series of filters are blue in color and convert tungsten light to color qualities acceptable for use with daylight film. The 85 series of filters are amber in color and convert daylight to color qualities acceptable for use with tungsten film.

The correct filter to use for a given situation with a given film can most accurately be determined by consulting conversion filter tables in the *Photo-Lab-Index* or reading the filter and film data sheets.

COLOR COMPENSATING FILTERS

Color compensating (CC) filters are used to adjust the overall color balance obtained from color film, particularly slide film. Without the use of color compensating filters, improper color cast can result.

For cameras, CC filters are normally used to color balance the light from sources, such as fluorescent, tungsten, and mercury-vapor lights, and the "bounce" light reflected from colored surfaces. They are also used to balance lighting effects under unusual circumstances; for example, underwater lighting. These filters can be used to compensate for a known color deficiency of an unexposed color film. They can also be sandwiched (layered) when mounting a color transparency to compensate for an off-color hue.

Table 3-4.—Filters and Exposure Increase for Making Color Pictures by Fluorescent Light

Type of fluorescent lamp	Type of color film	
	Daylight	Tungsten
Cool White	30M + 2/3 f/stop	50M + 60Y + 1 1/3 f/stops
Deluxe Cool White	30C + 20M + 1 f/stop	10M + 30Y + 2/3 f/stop
Standard Warm White	40C + 40M + 1 1/3 f/stops	30M + 20Y + 1 f/stop
Deluxe Warm White	60C + 30M + 1 2/3 f/stops	10Y + 1/3 f/stop
White	20C + 30M + 1 f/stop	40M + 40Y + 1 f/stop
Daylight	40M + 30Y + 1 f/stop	No. 85B + 30M + 10Y + 1 f/stop

Whenever possible, you should conduct photographic tests in advance, using the type of light you expect to encounter. Consult the *Photo-Lab Index* for the most accurate filtration to use for your film, filter, and lighting situations. Table 3-4 provides an example of a good starting point for test exposures. When in doubt, you should use a filter that provides for average correction. For daylight film, you should use a 30M filter with a 2/3 f/stop exposure increase. For tungsten film, you should use a 50R filter and a 1 f/stop exposure increase.

CC filters may be used alone or in various combinations. However, when you use them in combination, the maximum number of filters in front of a lens should not exceed three. More than three filters adversely affect image quality. When combining CC filters, you should avoid creating a neutral density effect. Neutral density is caused when all three of the primary colors are present in the combined filters; for example, a cyan (blue and green) filter and a red filter.

CC filters are available in blue, green, red, yellow, magenta, and cyan. Each color is available in a range of densities. The color and density of a CC filter are identified in the filter designation, such as CC50Y. The CC indicates color compensating, the 50 indicates a peak density of 0.50 to blue light, and the Y is the first letter of the filter color-yellow. The peak density of a CC filter refers to the maximum absorption of the color of light that is complementary to the color of the filter. CC filters are available only in gelatin squares.

The color star (fig. 3-4) indicates various color relationships of color compensating filters as follows:

1. Complementary colors are opposite each other: cyan is complementary to red, yellow is complementary to blue, and magenta is complementary to green.

2. Any one color is a combination of the two colors adjacent to it:

$$R = M + Y$$

$$Y = R + G$$

$$G = Y + C$$

$$C = G + B$$

$$B = C + M$$

$$M = B + R$$

Figure 3-4.—Color star.

C302.24

3. The warm colors are at the top of the horizontal axis. The cool colors are at the bottom.

4. Filters of the same color are added and subtracted normally:

$$30M + 20M = 50M$$

$$10B - 05B = 05B$$

5. When two filters of different colors and equal densities are combined, the color of the combined filters changes, but the peak density remains the same.

$$10M + 10C = 10B$$

$$10R + 10G = 10Y$$

6. A filter combination having all three primary colors creates neutral density. To correct this neutral density, subtract the lowest density from each color.

$$10R + 20G + 30B$$

$$\underline{-10 \quad -10 \quad -10}$$

$$0R + 10C + 20B \text{ (Results)}$$

SPECIAL-PURPOSE FILTERS

Special-purpose filters for use with black-and-white film are those filters not classified specifically as contrast or correction filters. Some of the special-purpose filters can be used with both black-and-white and color film. Two of these special-purpose filters are intended primarily for use with color film.

NEUTRAL DENSITY FILTERS

Neutral density (ND) filters reduce the amount of light passing through a camera lens without changing the reproduction of colors in the scene. These filters are nonselective in their absorption of colors of light and therefore uniformly reduce the various colors of light in the spectrum. Thus white light and colored light are transmitted through an ND filter with only the intensity of the light being affected. These filters can be used with both black-and-white and color film. Neutral density filters are gray in appearance. These filters may be needed for pictures being made of a brilliant subject in bright sunlight. When you have set the fastest shutter speed and the smallest f/stop and still cannot make the picture without overexposing the film, you can use an ND filter to further reduce the exposure. Neutral density filters manufactured by Kodak are called Wratten Neutral Density Filters and are available in several densities. The ten most popular densities, with the

Table 3-5.—Neutral Density Filters

Density	Exposure reduced by f/stops
.10	1/3
.20	2/3
.30	1
.40	1 1/3
.50	12/3
.60	2
.70	2 1/3
.80	2 2/3
.90	3
1.00	3 1/3

amount of exposure reduction provided, are shown in table 3-5.

When you desire to reduce the depth of field but maintain a given shutter speed, ND filters permit the use of a larger f/stop which in turn, reduces the depth of field. Neutral density filters are used extensively in motion-picture photography where depth of field is usually quite deep. ND filters are also used with mirror type of lenses where there is no aperture control.

HAZE FILTERS

Suspended in the earth's atmosphere are minute particles of vapor and dust that cause a veil-like appearance called haze. This haze is most apparent in distant scenes. Haze is the result of sunlight being scattered by minute particles of matter that are present in the air. The amount of haze can vary due to atmospheric conditions. Haze should not be confused with mist, fog, smog, smoke, or clouds. These conditions can also produce a veil-like appearance, but filters have no effect.

When sunlight is scattered, both green light and red light are also scattered by the ever-present haze, but not nearly as much as ultraviolet radiation, violet, and blue light.

When filters are used to absorb scattered sunlight, penetration of the haze is possible. A haze filter is any filter that absorbs atmospherically scattered sunlight. A

haze filter includes contrast and correction filters. When contrast and correction filters are used for haze penetration, they may be considered special-purpose filters. Although contrast filters can be used for cutting haze, these filters affect the gray tone rendering of colored objects. The contrast and correction filters that absorb the shorter wavelengths are the most effective. The recommended contrast and correction filter colors, in the order of greatest to least effective for haze penetration, are as follows:

Red
Orange
Yellow
Green

The use of an infrared sensitive black-and-white film with an infrared filter provides the greatest haze penetration of all. Special, visually opaque infrared filters completely absorb the scattered ultraviolet radiation and the visible light that produce haze. This absorption by an infrared filter allows the scene to be photographed entirely with unscattered infrared radiation. An infrared sensitive black-and-white film without an infrared filter, or at least a red contrast filter, is not effective for haze penetration. Infrared black-and-white film is sensitive to ultraviolet radiation, violet, and blue light as well as infrared radiation and red light. The gray tone rendering of a colored subject in a black-and-white print produced from an infrared negative is greatly distorted or contrasty.

The visually opaque infrared filters are identified by numbers as follows:

87
87A
87B
87C
88A
89B

When the effect of haze is to be reduced with an equal change to the gray tone rendering of all colored objects in a black-and-white print, filters that primarily absorb ultraviolet (UV) radiation are required. These filters have a very pale pink or yellow tint and may be identified by numbers as follows:

2A
2B

2C
2E

Colorless haze or ultraviolet absorbing filters are often used to protect the front element of a lens from damage. It is much cheaper to replace a filter than it is to repair or replace a lens.

The polarizing filter is another type of special-purpose filter that can be used to reduce the effects of haze.

POLARIZING FILTERS

Polarizing filters look like gray neutral density filters. However, their effect becomes apparent when you look at the blue sky through a polarizing filter while rotating it. As you rotate the filter, the sky appears to get darker, then lighter.

Polarizing filters are used in black-and-white and color photography for the following reasons:

1. Reduction or elimination of unwanted reflections (glare) from nonmetallic surfaces, such as glass and water
2. Exposure control, similar to ND filters
3. Reducing the effects of haze
4. Darkening the blue-sky image in both black-and-white and color photography
5. Increasing color saturation in a color photograph without altering the hues of image colors

As discussed in chapter 1 of this training manual, the term *polarize* refers to a property of light that cannot be seen—the direction in which light rays vibrate. Unpolarized light rays vibrate in all directions at right angles to the ray itself. A light ray is polarized when vibrations are in one direction only.

Any synthetic material that polarizes light may be called a polarizer, or polarizing device. A polarizing screen is a polarizer in sheet form.

There are a number of different polarizing filters. However, there are only two main types: one type fits over the camera lens and the other is designed to be used over a light source. Since they do not affect color, polarizing filters and screens may be used for both black-and-white and color photography. A polarizing device used over the camera lens may have small posts (known as indicator handles) projecting from the rim for aligning the axis of the polarizing grid.

The polarizing filter may be thought of as a screen, with an optical grid or slots, that stops all light that is not vibrating in a plane parallel to the axis of the grid lines.

As the filter is rotated, the amount of polarized light can be controlled. When the rodlike crystals are perpendicular to the vibration direction of the light, the polarized light is greatly absorbed. When the rodlike crystals are parallel to the vibration direction of the polarized light, the polarized light is almost totally transmitted.

Because polarizing filters are colorless, they can be used as neutral density filters. Even when polarized light is not present in a scene, polarizing filters can be used to reduce the intensity of light. When two polarizing filters are used, their combined densities can be varied considerably.

In color photography, the only way you can reproduce the sky darker without affecting the other colors in the scene is to use a polarizing filter. You can achieve various effects from light sky to dark sky by rotating the filter to various positions. You can see this effect by viewing the scene through the viewfinder of a single-lens reflex (SLR) camera or by viewing the scene through the ground glass of a view camera. To see how much reflection control you are getting, rotate the filter as you are viewing the scene.

Getting the maximum effect with a polarizing filter depends on your angle to the subject as well as the rotation of the filter. When the reflection cannot be completely eliminated, try changing your camera angle to the subject. The maximum control of unwanted surface reflections and greatest reduction of light intensity occurs when two polarizing filters are used with their optical grids perpendicular to each other. This arrangement can be either two filters in tandem in front of the camera lens or one filter in front of the light source and another filter in front of the camera lens. You cannot control reflections from bare metal surfaces because the reflected light is not polarized.

SKYLIGHT FILTERS

By absorbing ultraviolet radiation, a skylight (1A) filter adds warmth to a scene recorded on a color transparency film. It does this by reducing the bluish cast prevalent in distant scenes and in scenes photographed on heavily overcast days or in open shade. A skylight filter is used primarily with daylight color reversal film exposed under the above conditions. A skylight filter is light pink in color.

FILTER FACTORS

Filters function by absorbing a portion of the light reflected from the subject to the camera. To compensate for this absorption and the loss of light, you may have to increase the exposure to compensate for the light absorbed by the filter. A numerical value is assigned called a “filter factor” or multiplying factor. This numerical factor is based on several variables that include the color sensitivity of the film, density of the filter, color of the filter, and color temperature of the light source. As these variables change, the filter factor also changes to produce the correct exposure consistently. Filters are often identified as “2 X yellow” or “4 X orange.” That implies that the filter factor is 2 and 4, respectively. Remember, the filter factor does not always remain constant when conditions change.

For example, a blue filter used with panchromatic film exposed with daylight requires a smaller filter factor than when the same film and filter are used with tungsten light. The reason for this is daylight has a higher content of blue light that is readily transmitted by the blue filter. Thus, with the same film and filter combination and with the same camera shutter speed and f/stop, more exposing light is available at the film plane with daylight as compared to tungsten light.

A filter that absorbs a great amount of illumination from a given light source is assigned a larger filter factor. A filter that absorbs a lower amount of illumination from the same light source is assigned a smaller filter factor.

To obtain the necessary light at the film plane for correct exposure with a filter, you must increase the original calculated exposure (without a filter). This increase in exposure is determined with a filter factor. When a filter has a factor greater than 1, an adjustment to the exposure must be made.

There are three general methods of using filter factors to determine the exposure increase required:

1. Divide the ISO speed by the filter factor, and use the product as the effective film speed.

Example: If the filter factor is 2 and the ISO speed of the film is 100, the effective film speed is 50 ($100 \div 2 = 50$).

Thus setting a film speed of 50 on your light meter produces the equivalent of 1 f/stop of additional exposure.

2. Determine the required exposure without the use of a filter; then multiply the unfiltered shutter speed by the filter factor.

Table 3-6.—Filter Factor Equivalent Exposure Table

Filter factor	Open lens aperture (f/stop)	or if the "unfiltered" shutter speed is									
		1/2	1/4	1/8	1/15	1/30	1/60	1/125	1/250	1/500	1/1000
2	1	Use a "filtered" shutter speed of									
		1	1/2	1/4	1/8	1/15	1/30	1/60	1/125	1/250	1/500
4	2	2	1	1/2	1/4	1/8	1/15	1/30	1/60	1/125	1/250
8	3	4	2	1	1/2	1/4	1/8	1/15	1/30	1/60	1/125
16	4	8	4	2	1	1/2	1/4	1/8	1/15	1/30	1/60

Example: The unfiltered exposure calls for 1/60 second, and the filter factor is 3. The correct exposure is 1/20 second ($1/60 \times 3 = 1/20$ second). However, most cameras do not have a 1/20 second shutter speed; therefore, use 1/15 second or the next slowest shutter speed.

3. When you are using an SLR camera with through the lens (TTL) metering, put the filter on the camera lens and adjust the exposure in the normal manner. However, certain dark blue, red, and orange filters may give faulty readings if used with TTL metering systems because the meter reads 18 percent gray. The camera light meter may not be sensitive to the color of light passed by the filter.

4. Consult a filter factor equivalent exposure table. (See table 3-6.)

DARKROOM FILTERS

No types of filters are used almost exclusively in the photographic darkroom. They are safelight filters and printing filters. The printing filters include variable contrast filters for printing black-and-white materials and color printing filters for printing color materials.

SAFELIGHT FILTERS

The word *safelight* in photography is used to describe filtered tungsten illumination or direct illumination from a sodium-vapor lamp. The color of a sodium-vapor lamp does not affect (expose) light-sensitive materials under prescribed darkroom conditions. The word *safe* is misleading since light-sensitive materials are never completely safe from

safelight illumination. The use of a safelight with some types of light-sensitive materials is not recommended. Compatible safelight filters for use with certain light-sensitive materials should be selected on the basis of color sensitivity and emulsion speed of the material. The best method of selecting a darkroom safelight filter is to use the filter recommended by the manufacturer of the light-sensitive material. Safelight filters absorb that portion of the visible spectrum produced by a tungsten lamp that would affect the light-sensitive material being handled.

Sodium-vapor lamp safelights use sodium gas to provide safelight illumination. Incandescent sodium gas produces a very narrow band of visible light in the yellow-orange portion of the spectrum. Colorblind printing papers are not sensitive to this monochromatic (one color) band of light, whereas the human eye is very sensitive to it. Therefore, a brighter print room is possible without the light affecting the printing paper. By using specially designed filters that further reduce the narrow band of sodium-vapor light, black-and-white materials sensitive to green and red light can be handled under this illumination. Table 3-7 provides some examples for the application of safelight filters. Always consult the *Photo-Lab-Index* to determine the best safelight for use with various light-sensitive materials.

VARIABLE CONTRAST PAPER PRINTING FILTERS

To obtain various degrees of contrast using variable contrast printing papers, use a series of magenta and yellow filters. The magenta filters are used to print black-and-white negatives that are low in contrast.

Table 3-7.—Safelight Filters

Filter Designation	Color	Use With
OA	Greenish Yellow	Black-and-white contact and duplicating materials and projection films
OC	Light Amber	Printing papers
No. 1	Red	Blue sensitive films
No. 1A	Light Red	Orthochromatic copy films
No. 2	Dark Red	Orthochromatic films
*No. 3	Dark Green	Panchromatic films
<p style="text-align: center;">NOTE</p> <p>*Use caution when processing panchromatic film under a No. 3 safelight. When a No. 3 safelight is used, the film should not be exposed to it until at least half of the developing time has passed. Then the film should be examined quickly at a distance of about 36 inches from the safelight. Much experience is needed to judge proper negative development by the process of inspection, and it is rarely performed.</p>		

Yellow filters are used to print black-and-white negatives that are high in contrast. Variable contrast printing filters are discussed in chapter 10 of this TRAMAN.

FILTERS FOR COLOR PRINTING

Filters used to print color are as follows: color compensating (CC), color printing (CP), ultraviolet absorbing, and dichroic. Each one of these filters is discussed below.

Color Compensating Filters

The color compensating filters used for printing color materials are the same CC filters used with color film. These filters are used to modify the color quality of the exposing light needed to print the color negatives or transparencies. CC filters are used between the lens and the paper in the color printing process. These CC filters are referred to as a filter pack

CC filters control the color of light that strikes the emulsion. They control the amount of light each emulsion layer receives during exposure. That results in the amount of color dyes formed in each emulsion layer. The overlapped colored dyes (cyan, magenta, and

yellow in proper proportions) represent the colors of the original scene.

Color Printing Filters

Color printing (CP) filters are used in color printing, the same as CC filters with one exception. CP filters are placed in the enlarger between the light source and the negative or transparency being printed. That is done because CP filters are made of acetate and affect image definition.

CP filters are available in red, cyan, magenta, and yellow with densities of 0.05, 0.10, 0.20, and 0.40. The color of a filter and its peak density are identified the same as CC filters.

Ultraviolet Absorbing Filters

Ultraviolet absorbing filters for color printing prevent the fogging of the color material by ultraviolet radiation emitted by the exposing light source. This filter is not considered part of a printing filter pack, but it is always present in color printing systems. An ultraviolet absorbing filter for color printing is identified as 2B.

Dichroic Filters

Most photographic filters use colored dyes that absorb certain wavelengths and allow others to be transmitted. Such filters do not begin and end transmission at precise wavelengths.

Sharp-cutting, narrow-band filters are produced using wavelength interference rather than wavelength absorption. Dichroic or interference filters pass certain precise wavelengths and reflect all others.

Dichroic filters are used extensively in color printing and photographic testing systems. Because of their stability and long life, dichroic filters provide more accurate and more precise filtration.

HANDLING AND STORING OF FILTERS

A gelatin filter is protected by a thin lacquer coating that provides little protection against careless handling. Handle these filters carefully and only the edges. When not in use, gelatin filters should be stored in their original package, or they can be stored in clean paper between pages of a book. Gelatin filters should be kept flat and stored in a dark, dry place. Continued stress on gelatin filters can deform them permanently. When stored in high-humidity areas, they can become cloudy.

Dust particles should be removed from gelatin filters by brushing gently with a clean camel-hair brush or by clean, low-pressure air.

Glass filters or gelatin filters mounted between glass should be treated the same as photographic lenses. They should be kept in protective boxes or containers and should never be exposed to dampness or dirt. Never wash glass-mounted filters with water. When water comes in contact with the gelatin at the edges of a glass-mounted filter, it causes it to swell and allow air to enter between the gelatin and the glass. That causes a defect in the optical properties of the filter.

When a glass-mounted filter becomes dirty, you should not rub or breath on it. Use a piece of soft cloth or lens tissue moistened with lens cleaner. Do not allow the lens cleaner to touch the edges of the filter. Large pieces of grit should be removed with a camel's hair brush before attempting to clean the filter.

Do not expose gelatin or glass filters to temperatures higher than 122°F (50°C). High temperatures, high humidity, and time affect the stability of the dyes and shorten the life of the filter.

You should now have a basic understanding of filters and how they affect various wavelengths of light. You should know the ways in which filters are used for exposing light-sensitive materials. Filters are an integral link to high-quality products. This knowledge provides you with an invaluable tool in filter application for all the various stages of the photographic processes.

CHAPTER 4

STILL CAMERAS AND CONTROLS

Cameras have gone through many changes in design over the years. Several of your chiefs and division officers remember lugging around bulky, cumbersome 4x5 Speed Graphic cameras with film holders and tripods just to cover routine assignments. Through the development of modern-day cameras and film, small, hand-held cameras are commonly used. A large variety of cameras are available in the imaging facilities of the Navy. After learning the nature of your assignment and the equipment available, you must choose the equipment that will get the job done best, whether it be a 4x5 view camera or a small, hand-held electronic camera.

The human eye may be compared to a camera. There are several similarities. The eye is a physiological optical instrument. The camera is a mechanical optical

instrument. The eye has a lens, and like the lens of a camera, it forms an image on a light-sensitive surface (fig. 4-1). The lens of the eye focuses light on the retina. The camera lens focuses light on the film plane. The lens of the eye focuses by changing its curvature, the camera lens by changing its focal length. The diaphragm on a camera is similar, like the iris of the eye. When the light is bright, the iris closes down, reducing the brightness of the image. Likewise, when the light is bright, the camera diaphragm closes down. When the light is dim, the diaphragm opens up. The components of the eye are held together by the sclera, the components of the camera by the camera body.

A camera in its simplest form (fig. 4-2) is a lighttight box with a lens to form an image, a shutter to control the length of time light is allowed to act on the film, a

Figure 4-1.—Comparison of human eye to a camera.

Figure 4-2.—A simple camera.

R. B. Burrows
302.4

Figure 4-3.—35mm single-lens reflex (SLR) camera.

diaphragm to control the brightness of the image, a means of holding the film at the back of the camera, and a viewfinder so the photographer knows what the image is, and of course a body to hold it all together.

Simple cameras, such as the one described, have limited capabilities. They have a fixed-focus lens that cannot produce a sharp image of a subject closer than about 6 feet. Also, the shutter speed and diaphragm are preset and cannot be altered. The capabilities of a simple camera can be enhanced by adding features to perform the following:

- Focus on subjects at various distances
- Adjust the lens for different lighting conditions
- Change various lenses quickly to change focal length and fields of view

- Change shutter speed to “capture” images of moving subjects
- Use synchronized electronic flash
- Meter the image brightness of the subject to either manually or automatically adjust the diaphragm and shutter speed

Figure 4-3 illustrates a common 35mm camera and identifies the various camera controls.

CAMERA TYPES

In this chapter, the characteristics and functions commonly found on most cameras are discussed. No single camera can meet the requirements of every photographic assignment. There are a number of cameras to choose from in the fleet. These cameras

Figure 4-4.—Design of a typical SLR camera.

produce negatives that range in size from 35mm to 8x10 inches. You will learn to choose the camera that best meets the conditions of your assignment and the customer's photographic requirements.

The number and types of cameras available at an imaging facility depend primarily on the mission of the facility. All cameras have common features. Once you become familiar with the operation of one camera, you can learn quickly to operate other types. There are three general categories of cameras: small format, medium format, and large format.

SMALL-FORMAT CAMERAS

Cameras that produce negatives smaller than 35mm are considered small-format cameras. Small-format cameras are preferable when you need maximum freedom of movement and a large number of negatives without reloading the camera. The accessories, lenses, and flash equipment can be carried easily, and commonly 36 frames may be taken rapidly without reloading the film. This type of camera is helpful for news and action photography where several pictures must be taken in a short time from various ranges and under varying light conditions. The primary disadvantage of small-format cameras is they produce small negatives. The smaller the negative, the more it must be enlarged in printing.

The most popular professional small-format camera is the 35mm single-lens reflex (SLR). This camera has a mirror in the path of the image formed by the lens that

is reflected to a viewing screen for focusing and composition. This allows you to see what the lens sees regardless of the lens focal length or the lens-to-subject distance. The reflex system is simple and reliable. It has three main elements: a hinged mirror, a matte focusing screen, and a five-sided glass prism called a pentaprism. The mirror, in the viewing position, is below the viewing screen and behind the lens. It is at a 45-degree angle and projects the image formed by the lens up to the focusing or viewing screen. The pentaprism reflects the image from the focusing screen, so you can see it in the camera eyepiece. Figure 4-4 shows the design of a typical SLR camera.

When the shutter release is pressed, the mirror swings up and out of the light path, so the light can reach the film. It also seals off the viewfinder, so light entering the eyepiece cannot reach the film. After the film is exposed, the mirror swings back down, and the image is visible again in the viewfinder.

CAUTION

The reflex mirror is thin glass coated on the front with silver, so care must be taken not to damage it by touching or scratching it. Follow only the procedures listed in the Planned Maintenance System (PMS) for cleaning camera mirrors.

Almost all 35mm cameras have focal-plane shutters. Focal-plane shutters simplify the construction of the camera and make interchangeable lenses smaller,

Figure 4-5.—The shutter, aperture, and mirror operate in a precise sequence when exposures are made.

lighter, and less expensive. The shutter, aperture, and mirror work together in a precise sequence that is repeated each time the shutter is tripped (fig. 4-5).

Most SLR lenses have an iris diaphragm. The diaphragm is held wide open for focusing and viewing.

The aperture is then stopped down automatically to the preset working aperture at the instant the exposure is made. That means the image on the viewing screen is bright, easy to see, and focus; but only controlled brightness reaches the film for exposure.

Focusing is done by turning the lens focusing ring. A screw thread that runs around the inside of the lens barrel moves the lens closer or farther away from the film as the focusing ring is turned. The interchangeable lenses of most 35mm cameras are attached by a bayonet flange. Each lens mount differs slightly for each manufacturer of lenses and cameras, thus different lenses and camera bodies cannot be interchanged.

Most 35mm SLRs have a built-in light meter that reads through the lens (TTL). The light meter may read the light falling on the mirror, the shutter curtain, the focusing screen, or even on the film at the instant of exposure. On an automatic camera, the f/stop or shutter speed is adjusted automatically for correct exposures. On manual cameras, the light meter produces a display in the viewfinder to indicate the correct camera settings. You must then set the camera controls to get the correct exposures.

MEDIUM-FORMAT CAMERAS

Medium-format cameras are very popular in Navy imaging facilities. Except for the increased size, these cameras are just as versatile as small-format cameras. Interchangeable lenses, TTL metering, SLR focusing systems, and both manual and automatic controls are available on medium-format cameras. The advantage of a medium-format camera is the larger negative size of 120 or 220 film. These cameras are commonly used for portraiture or when relatively large prints are required from the negative. The most common medium-format camera used by Navy imaging facilities is the Bronica ETRS (fig. 4-6). This camera is available in almost all Navy imaging facilities, both afloat and ashore.

LARGE-FORMAT CAMERAS

Large-format cameras are used when you must retain maximum detail in the negative. This is necessary when certain subjects are photographed to exact scale or when large prints are required. Large-format cameras produce negatives 4x5 or larger. The most common large-format cameras are view cameras and copy cameras. Features common to all large-format cameras are as follows:

- Ground glass viewing and focusing

*Courtesy of Tamron Industries, Inc.
302.267x*

Figure 4-6.—Bronica ETRS medium-format camera.

- Both front and rear focusing
- Bellows that extend to permit at least a 1:1 image ratio

In addition to the features listed above, the view camera has additional features that control image sharpness and distortion. The view camera is discussed later in this chapter.

CAMERA CONTROLS

When you take a picture, the camera causes light reflected from the subject to be imaged on light-sensitive material. The camera controls this action in several ways. The first control is focus. Cameras have components to show what part of the scene will be recorded in sharp focus on the film. For example, some cameras use a coincidence or split-image range finder, and others use a focusing screen or ground glass.

The second camera control is the **lens aperture**. This control is located next to the focusing ring on most cameras. As discussed in chapter 1, the aperture affects both focus and exposure.

The third control is **shutter speed**. The shutter controls the length of time light is admitted to the film. Shutter speed also has an effect on the way movement is recorded on film.

FOCUS

Focusing involves adjusting the distance between the lens and the focal plane, or film plane, when photographing subjects at various camera-to-subject distances. When a camera lens is focused on a subject point, all light rays from that point, and only that point, are brought to sharp focus at the film plane. When about 600 or more feet from the camera, the subject is considered to be at infinity. A subject at infinity is so far from the camera that rays of light reflected to the lens from the subject are considered parallel. When a camera is focused on a subject at infinity, the distance between the optical center of the lens and the film plane (lens-to-film distance) is equal to the lens focal length. At this point the lens is closest to the film plane. As the camera-to-subject distance decreases, the lens-to-film distance must be increased to bring the subject into focus.

When you are taking a picture of only one subject, focusing is simple; however, when you want to include several subjects at different distances from the camera in the same picture and have them all in sharp focus, it becomes more complicated. Unless the subject is distant scenery with nothing in the foreground, there is always one object that is closer to the camera than another. Then you must decide what part of the scene is to appear in sharp focus. In simple cases, such as a sailor standing against a plain background, the decision is simple—focus on the sailor. In more complex cases, when subjects both close and far from the camera must be in sharp focus, you should focus about one third of the distance into the scene. In other words, focus about one third of the distance between the closest and farthest subject you want in sharp focus. This is known as the **depth of field**.

The way you focus the camera will depend on what part of the picture is most important and its purpose; for example, the pictures a civil engineer needs of a building at a naval air station is altogether different from the pictures a visitor to the air station wants to take home. The engineer needs pictures that show a maximum amount of detail throughout the scene. The visitor, on the other hand, is more interested in pictures that bring back pleasant memories. The requirements of the picture determine what you should focus on. The engineer needs to have everything in the picture in sharp focus. You might accomplish this as follows: Measure the distance to the nearest point of the picture and the distance to the farthest part of the scene. Then consult the depth-of-field scale on the camera lens to focus on a point between these two distances. Now, when the lens is stopped down to a small aperture, the depth of field is

Figure 4-7.—Focusing scale.

302.268

increased. Both near and far points will appear in focus. In photographing the scene for a visitor, you may want to emphasize only the entrance way to the building, rather than concentrating on getting everything in the picture in sharp focus.

Focusing Systems

Accurate focusing and framing are essential to good pictures, and modern cameras have many devices to help you get good focusing and framing results.

Because of the principles of depth of field, simple cameras are manufactured without any way of adjusting focus. The lenses of these simple cameras are prefocused at the hyperfocal distance. Remember from chapter 1, that the hyperfocal distance for a lens is determined by the focal length and the aperture. That allows “point and shoot,” ID, and passport cameras to produce pictures where everything from about one half of the hyperfocal distance through infinity are acceptably sharp.

Focusing is accomplished by adjusting the distance from the lens to the film. It does not matter which of the two is actually moved, the lens or the film. With hand-held cameras the lens is moved in and out. Usually on large-copy cameras, the camera back (film plane) is moved toward or away from the lens. That is because

the distance from the photographer to the lens board is usually too great to focus through the ground glass.

No matter what system you use to focus the camera, there must be a means for you to determine when the image is in focus. Some cameras have autofocus systems. Most camera systems used by Navy personnel are focused manually.

Focusing Scale

This is the simplest type of focusing system. It uses a scale of distances that indicates the distance where the focus is set. Primarily, these scales are engraved on the lens barrel. To use the focusing scale, you can measure the camera-to-subject distance, but, in most cases, you must estimate the camera-to-subject distance. This distance is then set to the focus index mark on the lens (fig. 4-7). Scale focusing can be useful when you anticipate quick action but do not have sufficient time to focus the camera. When using scale focusing, a small f/stop is helpful so you can rely on depth of field to provide an acceptably sharp image.

Ground Glass Focusing

With some cameras, focusing is done by viewing the image on a glass screen, called a ground glass. The image formed by a view camera is projected directly to the ground glass for viewing and focusing. Accurate focusing can be achieved using a ground glass. There is a drawback to this type of focusing. Because of the texture of the ground glass, very fine detail of the image is difficult to distinguish. That results in some leeway in focusing. Additionally, when you work too long at focusing the image, your eye will adjust and accept an image that is less than sharp. For this reason, it is helpful to place a magnifying loop directly on the ground glass. That helps in focusing quickly and accurately.

A ground glass focusing system shows directly the image that will appear on the film. The image size and depth of field records on the film the same as it appears on the ground glass. Ground glass focusing systems are commonly found on copy cameras and view cameras. The image on the ground glass appears upside down and backwards.

Reflex Focusing

A reflex focusing system also uses a ground glass or focusing screen; however, instead of the image being

Figure 4-8.—Twin-lens reflex camera.

formed directly on the ground glass or focusing screen, the lens forms the image on a mirror that reflects the image to the focusing screen or ground glass.

TWIN-LENS REFLEX.—The twin-lens reflex (TLR) system uses a matched set of lenses for focusing and viewing. One lens is the viewing lens; the other is the picture-taking lens. The viewing lens is always wide open. That makes focusing and viewing easy, but depth of field cannot be viewed. Depth of field must be determined by a scale that is provided on the lens or camera body.

An advantage of the twin-lens reflex system is that the image is visible on the focusing screen, before, during, and after exposure. A disadvantage of twin-lens systems is that parallax errors occur. Parallax refers to the difference between the image seen through the viewing lens and the image transmitted to the picture-taking lens (fig. 4-8). For distant subjects the difference is not very great or noticeable; however, when your subject is close to the camera, parallax is much more noticeable. You see a different image area through the viewing lens than what is being transmitted through the picture-taking lens. Some twin-lens reflex cameras have an indicator in the viewing lens, so you can compensate for parallax. Another disadvantage of the twin-lens reflex camera is that it takes practice to

Figure 4-9.—Split-image focusing.

follow action and compose the subject. The image seen on the focusing screen is backwards from the actual image. Twin-lens reflex cameras are no longer commonly used in Navy imaging, but they are still around.

SINGLE-LENS REFLEX.—Single-lens reflex (SLR) cameras have a focusing and viewing system that shows you the image formed by the picture-taking lens. SLR cameras are designed so the distance between the focusing screen and the lens is exactly the same as the distance between the lens and the film; therefore, whatever appears in focus on the focusing screen will also be recorded in focus on the film. With an SLR camera, there is no parallax error.

Sometimes two small prisms or a split screen is included in the central area of an SLR camera viewing screen. When the image is out of focus, it appears split in this area (fig. 4-9). Some screens have a central grid of minute prisms that produce a shimmering effect when the image is out of focus.

An SLR camera is focused by rotating the focusing ring on the lens until the image seen through the viewfinder is in sharp focus. SLR cameras are the most commonly used camera in Navy imaging today.

Direct-Vision Range Finder Focusing

Cameras that use direct-vision range finder focusing produce a double image in the viewfinder until the subject is in focus on the film plane. This system has a coupled range finder optical device that is linked to the focusing ring. To focus a direct-vision coincidence or split-image range finder camera, you must align two separate images of the subject. When looking through the camera viewfinder, you see a pale or tinted area in the center of the viewing window. This area shows the double image. To set the correct focus, you aim the camera so the subject you want in sharpest focus is in the pale area. You then turn the lens focus ring, or camera

Figure 4-10.—Direct-vision range finder focusing.

focus knob, until the double images coincide and only one image is seen (fig. 4-10).

The disadvantages of a direct range finder system are that it does not couple to a large variety of lenses, thus restricting its use to only several different focal-length lenses. Unlike the ground glass and SLR focusing systems, depth of field cannot be determined

in the direct-vision range finder system. Everything appears sharp through the viewfinder window.

Autofocus

Most autofocus cameras use the same principle as a direct-vision range finder camera. The autofocus camera determines the subject distance by comparing

PHC Ed Bailly
302.269

Figure 4-11.—Use of selective focus.

the contrast brightness of two images: one reflected from a fixed mirror, the other from a movable mirror. This system works on the theory that the sharpest images have the highest contrast. When maximum contrast is reached, an electronic device converts the contrast brightness information into impulses. These impulses start a motor that moves the lens to the point of sharp focus. This type of autofocus system does not perform effectively when the subject is all one color or does not contain much contrast.

Another type of autofocus camera uses sonar or infrared. These systems emit either a sonar or infrared signal to determine subject distance. The distance is determined by the amount of time it takes the transmitted energy to reflect back from the subject to a sensor on the camera. This information is then sent to a motor that moves the lens to the point of sharp focus. The sonar autofocus system has a disadvantage. You cannot photograph subjects through glass. The sonar reflects off the glass and not the subject.

SELECTIVE FOCUS

You do not always want everything in your photographs to be in sharp focus. By using selective focus, you can emphasize the main subject and draw attention to it. “Selective focus” means the use of a shallow depth of field to isolate or emphasize the subject (fig. 4-11). Selective focus is the control of the zone of sharpness, or depth of field, in your photographs.

Once the lens has been focused on the main subject of the picture, using a progressively larger aperture (f/stop) will reduce the zone in front of and behind the subject that is in focus. Long-focal-length lenses are more effective for selective focusing because of their larger real apertures. Wide-angle or short-focal-length lenses are not as effective for selective focus because of the great depth of field they provide at most apertures. The following factors provide the maximum selective focus control by minimizing depth of field:

- Working close-up
- Using a wide aperture

Figure 4-12.—Iris diaphragm.

40.163

- Using a long-focal-length lens
- Focusing on near objects

APERTURE

The aperture, or f/stop as it is commonly called, is used to regulate the diameter of the lens opening. That controls the luminance on the film plane. Besides controlling the luminance on the film plane, the f/stop also controls image sharpness by partially correcting various lens aberrations.

The most commonly used aperture control device is the iris diaphragm. An iris diaphragm is an adjustable device that is fitted into the barrel of the lens or shutter housing. It is called an iris diaphragm because it resembles the iris in the human eye (fig. 4-12). An iris diaphragm is a series of thin, curved, metal blades that overlap each other and is fastened to a ring on the lens barrel or shutter housing. The size of the aperture is changed by turning the aperture control ring. The blades move in unison as the control ring is moved, forming an aperture of any desired size. The control ring is marked in a series of f/stops that relate to the iris opening. The aperture controls the **intensity** of light that is allowed to pass to the film and the parts of the image that will appear in sharp focus.

Depth of Field

Depth of field is that zone both in front of and behind your subject that are in acceptably sharp focus. The focusing controls on most cameras are easy to use, providing you understand the factors that effect depth of field. To produce professional quality photographs, you must know how to control the depth of field.

Aperture, or f/stop, is the most important factor in controlling the depth of field. The smaller the f/stop opening, the greater the depth of field; for example, at f/16, a normal lens focused on a subject 16 feet from the camera may show everything in focus from 8 feet to infinity. At f/5.6, depth of field may range from about 3 feet in front of the subject to about 6 feet behind the subject. At f/2, only the subject focused on is sharp. As shown in figure 4-3, a shallow depth of field results in a blurry foreground and background, whereas greater depth of field results in more overall sharpness.

Camera-to-subject distance also has an effect on the depth of field. In general, the closer you are to the subject, the shallower the depth of field. Even at f/16 with a normal lens, if you focus on a subject only 3 feet from the camera, the depth of field may only be about 1 foot. At f/2, the subject's eyes may be in sharp focus, but the nose and ears are blurred. As you increase the camera-to-subject distance, the depth of field increases rapidly. Using an aperture of f/16 and focusing at 6 feet, the depth of field may extend from a foot in front of the subject to about 3 feet in back of the subject. Still using

Table 4-1.–How to Control Depth of Field

	Focus at the hyperfocal distance.

f/16 but focusing now at about 16 feet, the depth of field is almost at infinity. Most normal lenses for 35mm cameras produce these maximum ranges of sharpness at about 16 feet. Focusing any farther from the camera only reduces foreground sharpness. You must remember this point when attempting to get the greatest possible depth of field.

Lens focal length is also a factor in depth of field. The shorter the lens focal length, the greater the depth of field at a given aperture. In other words, a wide-angle lens provides more depth of field at f/8 than a normal lens, and a normal lens provides more depth of field at f/8 than a telephoto lens.

You know that a small aperture like f/16 provides more depth of field than a wide aperture like f/2. With experience, you can predict the best aperture for the depth of field desired. Even with experience, you do not always have to guess the aperture setting or calculate the hyperfocal distance, near distance, and far distance by using formulas. Most lenses have a depth-of-field scale to guide you (fig. 4-13). The depth-of-field scale indicates the distance range from the camera that the subject(s) appear in acceptably sharp focus. The depth of field on an SLR is marked between the aperture ring and the focusing scale. Use the depth-of-field scale as follows:

1. Focus on the subject.
2. Select the f/stop.
3. Look at the depth-of-field scale and locate the marks that correspond to your chosen f/stop. The f/stop appears twice, once on either side of the scale center line.
4. Read the two distances on the focusing scale that are adjacent to the two f/stops on the

depth-of-field scale. You may have to estimate the distances.

You can see in figure 4-13 that the lens is focused at a distance of 30 feet with the aperture set between f/16 and f/22. You can see from the depth-of-field scale that the depth of field extends from approximately 11 feet to beyond infinity. If the aperture is opened up to f/8, the depth of field will range from about 16 feet to infinity.

At any given aperture, depth of field is maximized by focusing the lens at the hyperfocal distance. That is the closest point of acceptable sharp focus shown on the depth-of-field scale when the lens is focused at infinity. When you are changing the focus setting to the hyperfocal distance, the zone in front of the subject that is sharp is increased, and infinity is still the farthest point

PHC Ron Bayles

Figure 4-13.–Depth-of-field scale.

302.101

Figure 4-14.—When the lens is focused at 20 feet and set at f/22, the depth of field ranges from about 10 feet to infinity

in sharp focus. In figure 4-14, when the lens is set at f/22 and focused at infinity, the depth of field ranges from about 20 feet (the hyperfocal distance) to infinity; however, when you change the lens focus to 20 feet, the depth of field ranges from about 10 feet to infinity.

The lenses of modern SLR cameras stay at their maximum aperture until the shutter is tripped. These lenses provide a bright image in the viewfinder to focus. As a result, when you look through the viewfinder, you only see the depth of field for the maximum aperture and not the working f/stop. Most SLR cameras have a depth-of-field preview button to compensate for this. When you press it, the aperture closes down to the set f/stop. Although the viewfinder becomes darker, you can see the actual depth of field at the selected aperture.

Image Sharpness

The outer edges of a lens are least likely to produce a well-defined or aberration-free image; therefore, proper use of the diaphragm, aperture, or f/stop can improve image sharpness by blocking off light rays that would otherwise pass through the outside edges of a lens.

There is a limit to how far the aperture can be stopped down and still increase image sharpness. When the aperture is very small, it causes diffraction of light rays striking the edge of the diaphragm. Diffraction

results in a loss of image sharpness. This loss of image sharpness is especially noticeable in copy work

Physical limitations in the design of lenses make it impossible to manufacture a lens of uniform quality from the center to the edges; therefore, to obtain the best quality with most lenses, you can eliminate the edges of the lens from being used by closing down the aperture about two f/stops from wide open. This recommended adjustment is called the **optimum** or **critical aperture**. The optimum aperture for a particular lens refers to the f/stop that renders the best image definition.

When a lens is stopped down below the optimum aperture, there is an actual decrease in overall image sharpness due to diffraction. Although the depth of field increases when a lens is stopped down below the optimum aperture, image sharpness decreases; therefore, increased depth of field should not be confused with image sharpness. For example, the image formed by a pinhole camera has extraordinary depth of field but lacks image sharpness. When the lens aperture is closed down to the size of a pinhole, it behaves like one. This is an important factor for subjects in a flat plane (such as copying) where depth of field is not needed.

SHUTTER

A camera shutter controls both the exact instant when the film is exposed to light and the duration of that exposure. The shutter is used in conjunction with the diaphragm to control the exposure of the film. The most important function of the shutter is that it limits the time that light is allowed to pass through the lens and act on the film. There are two types of camera shutters: leaf and focal plane.

Leaf Shutter

The blades of this type of shutter are usually located between or near the lens elements and close to the diaphragm. It is sometimes called a between-the-lens shutter; however, a more correct term for this type of shutter is a leaf or diaphragm shutter.

Leaf shutters have several blades made of thin spring steel. When the shutter is closed, these blades, or leaves, are at rest and overlap each other. This prevents light from reaching the film. When the shutter release button is pressed, the blades move apart or open quickly and allow light to pass and expose the film. They remain open for the duration of the preset exposure time before springing shut again (fig. 4-15).

Figure 4-15.—Leaf shutter operation.

Leaf shutters have an important advantage over focal-plane shutters. Leaf shutters can be used with electronic flash at all shutter speeds. This is not true with focal-plane shutters. Focal-plane shutters can only be used at slow shutter speeds, usually at 1/125 second and below.

Focal-Plane Shutter

A focal-plane shutter is essentially two lightproof cloths or thin metal curtains that move across the film aperture in the same direction. This type of shutter is housed entirely within the camera body and is mounted on two rollers, one on each side of the film aperture

Figure 4-16.—Focal-plane shutter.

(fig. 4-16). As the curtain is moved from one roller to the other by spring tension, the second curtain follows, forming an opening that permits light to pass from the lens to the film. After the opening has passed, the second curtain stops and prevents additional light from reaching the film. In the design of focal-plane shutters, the curtains form a slit that travels across the film aperture to expose the film. When a slow shutter speed is set, the second curtain waits a relatively long time before it follows the first curtain; in this case, the slit is quite wide. When a fast shutter speed is set, the second curtain quickly follows the first and only a narrow slit is formed.

Shutter Speed

A range of shutter speeds is available on professional cameras. Common shutter settings are as follows: T, B, 1 second, 1/2, 1/4, 1/8, 1/15, 1/30, 1/60, 1/125, 1/250, 1/500, 1/1000, and 1/2000 second. The fastest between-the-lens (leaf) shutter speed is 1/500 second. Some focal-plane shutters can be as fast as 1/12000 second. In addition to a given set range of speeds, most shutters are made so they can be opened for an indefinite period of time. At the setting marked "T" (time), the shutter opens the first time the shutter release button is depressed and remains open until the shutter release button is depressed again. At the setting marked "B" (bulb), the shutter remains open as long as the shutter release button is depressed, but closes as soon as it is released.

The interval that you want the shutter to remain open is selected by moving a lever or shutter speed dial to that particular setting on the shutter speed scale. Unlike f/stops, the shutter speed you select must align exactly with the index mark. You cannot select a shutter speed in between two indicated shutter speeds. On the shutter

speed dial, the top part of the fraction (numerator) is not indicated; for example, the shutter speeds 1/60, 1/125, 1/250, and so forth, are indicated as 60, 125, and 250.

When a camera with a focal-plane shutter is used with an electronic flash, a predetermined shutter speed must be set. At this speed the shutter and flash unit are said to be in synchronization. When the flash and shutter are synchronized, the shutter opening is wide open at the same instant the flash fires. Usually, the slowest shutter speed that syncs with a flash unit is indicated in red or another off color or a lightning bolt symbol on the shutter speed dial.

Function

The shutter serves two functions: controlling the duration of the exposure and controlling subject movement. These two functions are entirely separate and distinct. You must determine the shutter speed required for each condition. After determining the shutter speed, you select the f/stop that provides the correct exposure for the film speed and lighting conditions. Normally, the duration of exposure is short enough to prevent image blurring. You can always set the shutter speed faster than the speed required to stop image motion, but it should not be longer if you want the image to be sharp; for example, when a shutter speed of 1/125 is sufficient to stop subject motion, you can set the shutter speed to 1/250 or faster, but not at 1/60 if you want to stop the motion and produce a sharp image. Each time you change the shutter speed, the diaphragm is adjusted to produce a properly exposed image.

The correct sequence in determining the diaphragm and shutter to produce a properly exposed negative is as follows:

1. Compose and focus the image.
2. Stop down or open up the diaphragm until the desired depth of field is achieved.
3. Select the shutter speed that will produce a proper exposure when combined with your aperture setting.
4. Determine whether the shutter speed is fast enough to prevent image blurring.
5. If the selected shutter speed is too slow, reset it to a faster speed and open up the aperture accordingly.

When you increase the shutter speed, you compromise and lose depth of field. Sometimes this is the only way to produce a useable image. If you cannot

sacrifice some depth of field, there are several alternatives you can use: select a faster film, increase the camera-to-subject distance, select a shorter focal length lens, or change the camera angle, so the relative motion of the subject to the camera is decreased.

Selecting the Shutter Speed

Knowing what shutter speed produces the right effect for each picture is a skill you, as a Navy Photographer's Mate, must acquire. Your pictures may easily be spoiled by movement of either the camera or the subject. In some instances, this movement can actually improve your photographs.

Novice photographers often find it hard to believe anything can happen during the brief instant the camera shutter is open. This is not true; images can be blurred when a shutter speed as fast as 1/250 of a second is used; for example, when the camera or subject moves during the fraction of a second the shutter is open, the image may be recorded on the film as a blur. Blurring caused by camera movement is noticeable in all images within the photograph. When blurring is caused by subject movement only, the background or some other part of the scene will be sharp, and the subject blurred. Camera movement blur can be corrected by supporting the camera properly or by using a faster shutter speed. Subject image movement can be reduced by using either a faster shutter speed or by panning the subject.

As explained previously, when a faster shutter speed is used, a wider aperture is required to produce correct exposure. For this reason you should know what minimum shutter speed is required to stop or freeze different actions. You must take into account conditions that exist when taking photographs. Strong winds, vibrations, or a ship rolling from side to side must be considered. There is a general rule you must follow for determining shutter speed when handholding a camera. The slowest shutter speed recommended to prevent camera movement blur is to set the shutter speed so it matches the focal length of the lens. When a shutter speed does not exist for the focal length of the lens, select the next highest shutter speed; for example, 1/30 second for a 25mm lens, 1/50 second for a 50mm lens, 1/125 second for a 100mm lens, 1/250 second for a 200mm lens, and so forth.

When a subject is in motion during exposure, the image on the film also moves. Even though the duration of exposure may only be 1/1000 of a second, the image moves a small fraction of an inch during this time. The problem you encounter is how much image movement

PH3 Tim O'Neill
302.95

Figure 4-17.—Panning with a moving object.

can be tolerated before it becomes objectionable and adjust your shutter speed accordingly. To determine what forms an objectionable blurring of the image, you must visualize how the photograph is going to be used. An image of a contact print can be much blurrier than an image that is magnified many times. A print that is viewed up close must be much sharper than a print viewed from a distance.

Once you know how the photograph is to be used, you can determine the shutter speed required to produce an acceptably sharp image. In some situations, it may not be possible to produce an image that is completely sharp. When you want a sharp image of a fast-moving object, use the **panning** technique. When using the panning technique, you move the camera and follow the action of the subject until you make the exposure. This method may blur the background but can provide a sharp image of a moving object even at relatively slow shutter speeds (fig. 4-17).

There are five factors that determine the distance an image moves on the film during exposure. You must consider these factors each time you photograph a moving object. These five factors are as follows:

1. The lens-to-subject distance
2. The lens focal length
3. The speed of the object perpendicular to the lens axis
4. The direction of movement
5. The exposure time

Whenever one of these five factors change, the distance the image moves during exposure also changes. The first four factors determine the speed that the image moves across the film. The fifth factor limits the time it is allowed to move, thereby limiting the distance of image movement.

Subject movement on the film plane is greatest when the subject is moving across the angle of view of

the lens (perpendicular to the lens axis). For example, when the subject is moving straight towards or straight away from the camera, it may appear as though it is hardly moving and a fast shutter speed is not required to produce a sharp image; however, when that same subject moves at the same speed across the field of view of the camera, the speed of the subject appears much faster. A faster shutter speed is required to stop the action in this case.

The camera-to-subject distance also affects the amount of image movement at the film plane; for example, a car moving across your field of view at 55 mph from a distance of 700 yards appears to be moving slowly. The same car moving at 55 mph and only 15 feet away appears to be moving very fast; therefore, the closer a moving object is to the camera, the faster the shutter speed must be to capture a sharp image. When the subject is moving diagonally across your angle of view, movement is more apparent than when moving straight away or toward the camera, but less apparent than when moving straight across the field of view.

Remember, long-focal-length lenses exaggerate the effects of camera and subject movement, and short-focal-length lenses reduce the effect.

Experience and common sense are your best guides for determining shutter speed that will minimize image movement, but the following can be used as a guide to help make these determinations:

- Double the shutter speed when the subject speed is doubled.
- Halve the speed when the speed of the subject is halved.
- Double the shutter speed when the camera-to-subject distance is halved.
- Halve the shutter speed when the camera-to-subject distance is doubled.
- Double the shutter speed when the focal length is doubled.
- Halve the shutter speed when the focal length is halved.
- When in doubt, use the next higher shutter speed.

There are mathematical formulas used to determine appropriate shutter speeds for subjects moving at all speeds when photographed with various lenses, but the use of these formulas is not practical. Table 4-2 shows stop motion relationships when a 50mm lens is used. This table is not intended to be memorized but is only

intended to provide a better understanding of the relationship of subject motion, distance, and direction.

COMBINING APERTURE AND SHUTTER SPEED

So far three camera controls have been discussed separately: focus, aperture, and shutter. Focus is the most straightforward because it is used to produce a sharp image of the subject. Aperture and shutter each affect the image in two distinct ways. They both control the amount of light that makes the exposure, and they both affect image sharpness. The aperture alters depth of field, and the shutter controls the image movement or blur.

The light-sensitive material must receive the correct amount of light to produce a quality photograph. Under most lighting conditions, it does not matter whether you use a wide aperture with a fast shutter speed or a small aperture with a slow shutter speed. When the combination is correct, both provide the same amount of exposure.

Aperture and shutter speeds each have a doubling and halving effect on exposure. This doubling and halving relationship of aperture and shutter allows you to combine different f/stops and shutter speeds to alter the image, while, at the same time, admitting the same amount of exposure to the light-sensitive material; for example, you have determined that the correct camera settings for your subject is 1/125 second, at f/16. Instead of using this combination of shutter speed and f/stop, you could double the shutter speed (to stop action) and halve the f/stop. In this example your new camera setting could be 1/250 second at f/11, 1/500 second at f/8, or 1/1000 second at f/5.6, and so on. Or when you need more depth of field, 1/60 second at f/22 or 1/30 second at f/32, and so on, can be used. These shutter speed and f/stop combinations are called equivalent exposures. Equivalent exposures are used to control depth of field and to stop motion. Table 4-3 shows some equivalent exposures of a typical situation.

Each of the combinations in table 4-3 produces the same exposure; however, the amount of depth of field and image blur are different in each image. The combination of shutter speed and f/stop is used to best capture the subject and effect you want to create.

You should use a light meter for most of the photographs you take. The light meter provides you with a number of f/stop and shutter speed combinations; however, depending on the situation, the level of light alone can determine the camera settings. For example,

Table 4-2.—Action Stopping Shutter Speeds for Normal-Focal-Length Lenses

Speed MPH	Type of Action	Distance	Direction of Action		
			Across Field of View	Diagonally	Straight Toward or Away
5	Slow walk, working with the hands	12	1/500	1/250	1/125
		25	1/250	1/125	1/60
		50	1/125	1/60	1/30
		100	1/60	1/30	1/15
10	Fast walk/ work, slow-moving vehicles	12	1/1000	1/500	1/250
		25	1/500	1/250	1/125
		50	1/250	1/125	1/60
		100	1/125	1/60	1/30
25	Running, sports, very active people, vehicles moving at a moderate speed	12	1/2000	1/1000	1/500
		25	1/1000	1/500	1/250
		50	1/500	1/250	1/125
		100	1/250	1/125	1/60
100	Very fast-moving vehicles and aircraft	25	1/2000	1/2000	1/1000
		50	1/1000	1/1000	1/500
		100	1/500	1/500	1/250
		200		1/250	1/125

Table 4-3.—Equivalent Exposures

Shutter Speed	f/stop
1/2000	f/4
1/1000	f/5.6
1/500	f/8
1/250	f/11
1/125	f/16
1/60	f/22
1/30	f/32
1/15	f/64

the light level may be so low that you have to use a slow shutter speed and the largest f/stop to get the proper exposure. After determining the correct exposure, you can decide how to present the subject. Remember, depth of field can be used to emphasize your subject, and shutter speed affects subject blur.

EXPOSURE CONTROL

The *term exposure* in photography means the amount of light that reaches the film or other light-sensitive material. The mathematical formula for exposure is the product of light intensity and the amount of time that the light acts on a light-sensitive material. There are two ways a formula is presented in photographic publications. They are as follows:

$$E = I \times T$$

and

$$H = E \times T$$

Where:

E or H = Exposure (lux-seconds or meter-candle seconds)

I or E = Intensity or illuminance (lux or meter candles)

T = Time (seconds)

Both of these formulas represent exposure. The second formula is presented in the more current publications.

As explained previously, camera exposures are controlled by the shutter speed and aperture. The shutter speed controls the time light is permitted to reach the film. The illuminance (or intensity as it is sometimes called) is controlled by the aperture of the camera. The term *illuminance* means the amount of light reaching the film plane. By adjusting these controls, you allow the correct amount of light to reach the film. The correct amount of light varies, depending on the film speed. Correct exposure for negative films is defined as the exposure required to produce a negative that yields excellent prints with the least amount of difficulty. Correct exposure for color reversal film produces color images in densities that represent the appearance of the original scene.

FACTORS THAT AFFECT EXPOSURE

You must consider four major factors that affect exposure when you are taking photographs. These factors are as follows:

- Film speed (ISO)
- Reflected properties of the subject
- Lighting conditions
- Bellows extension

Film Speed

As explained in chapter 2, ISO is a system of rating film speed or sensitivity to light. ISO numbers are arithmetic; that is, an ISO number that is twice as high as another ISO number is twice as sensitive to light. Each time an ISO film speed is doubled, the exposure should be halved. When the ISO is halved, the exposure should be doubled; for example, if the correct camera setting is 1/250 second at f/16 with ISO 100 film, the same subject photographed with ISO 200 film would require only half the exposure or 1/500 second at W16 or 1/250 second at f/22, and so on.

Daylight Conditions

The two primary considerations for determining your exposure under daylight conditions are the intensity and the direction of daylight.

INTENSITY.—From early morning until later evening, even on a clear day, the intensity of daylight is constantly changing as the sun rises, moves across the sky, and sets. Although the intensity of daylight varies throughout the day, the time between about 2 hours after

sunrise until about 2 hours before sunset is considered a time when the light intensity for the same geographical location remains constant for exposure purposes.

Daylight conditions for camera exposures can be divided into the following five intensity conditions.

Bright Sun on Light Sand or Snow.—Bright sun is daylight that is not affected by any apparent atmospheric interference. Because of the amount of reflected light from sand or snow, the intensity of light in these scenes is greater than that of a scene with average reflectance. This greater intensity of light requires a higher f/stop or a faster shutter speed to provide approximately one half of the exposure required for the basic exposure with bright or hazy sun.

Bright Sun.—This type of daylight illumination is produced on a bright, sunny day where distinct shadows are present. Bright sun is the condition that determines the BASIC EXPOSURE for an average scene.

Cloudy Bright.—A weak, hazy sun is the result of a heavier or thicker haze or cloud cover as compared to the bright sun condition. The condition causes a decrease in the daylight intensity and an increase in the diffusion of daylight. This lighting condition produces shadows that are soft or indistinct. A lower f/stop or slower shutter speed is required to approximately double the basic exposure to compensate for this decreased daylight intensity.

Cloudy.—Cloudy conditions are the result of a layer of clouds that further reduce the intensity of daylight and diffuse the light completely. This condition occurs on an overcast day when the position of the sun can be located only as a bright area in the clouds. Shadows are not present under this lighting condition. The scene brightness range is low and therefore photographs made during this condition usually lack good contrast. An increase of four times (two f/stops) from the basic exposure is required to compensate for the decreased intensity of light.

Heavy Overcast or Open Shade.—This condition exists when the position of the sun cannot be located. The scene brightness range is low and therefore photographs made during heavy overcast conditions usually lack good contrast. An increase of eight times (three f/stops) to the exposure is required horn the basic exposure to compensate for the decreased intensity of light.

DIRECTION.—The direction of the sun or light source illuminating your subject also affects your basic exposure. The camera settings recommended for films

Figure 4-18.—Lighting directions.

exposed during bright sun on light sand or snow, bright sun, cloudy bright, and cloudy conditions are for scenes that are front-lighted only. The direction of the light source from heavy overcast or open shade conditions does not affect exposure because it is extremely diffused and the direction is not apparent.

The amount of light reflected from the scene changes, as the direction of the light changes. As the lighting direction is changed from in front of the subject to behind the subject, the amount of light reflected from the subject is reduced; therefore, depending on the

direction from which the light is falling on your subject, you may have to compensate the camera exposure. There are three basic lighting directions with which you must become familiar. These lighting directions are as follows: frontlighting, side lighting, and backlighting (fig. 4-18).

Frontlighting.—Whenever light originates from behind the camera and illuminates the front of the subject, it is called frontlighting. A subject appears brightest and reflects the most light toward the camera when the subject is front-lighted.

Side Lighting.—As the camera is moved in an arc away from frontlighting, less light is reflected from the subject into the lens. Whenever the light source has a 90-degree relationship with the camera, the incident light on the subject is called side lighting. In side lighting situations, part of the subject is in shadow. Photographs of side-lighted scenes usually require two times (one f/stop) more exposure than frontlighted subjects when you want detail in the shadows.

Backlighting.—When the light source is directly behind the subject and aimed toward the camera, it is called backlighting. In back-lighted situations, the subject is in shadow and the light reflected from the subject toward the camera is decreased greatly. A silhouette effect (no shadow detail) of a back-lighted scene is produced by closing down one f/stop from the basic exposure. If shadow detail is desired, an increase of four times (two f/stops) from the basic exposure is required.

Reflection Properties

Otherwise the intensity and direction of light falling on the subject, the texture of the surface, and the colors and shades of the scene also have an effect on film exposure.

SURFACE TEXTURE.—Smooth, glossy surfaces scatter or diffuse reflected light very little; therefore, these objects reflect a large percentage of light to the lens. Rough surfaces greatly scatter and diffuse light. Less light from rough surfaces is reflected to the lens.
